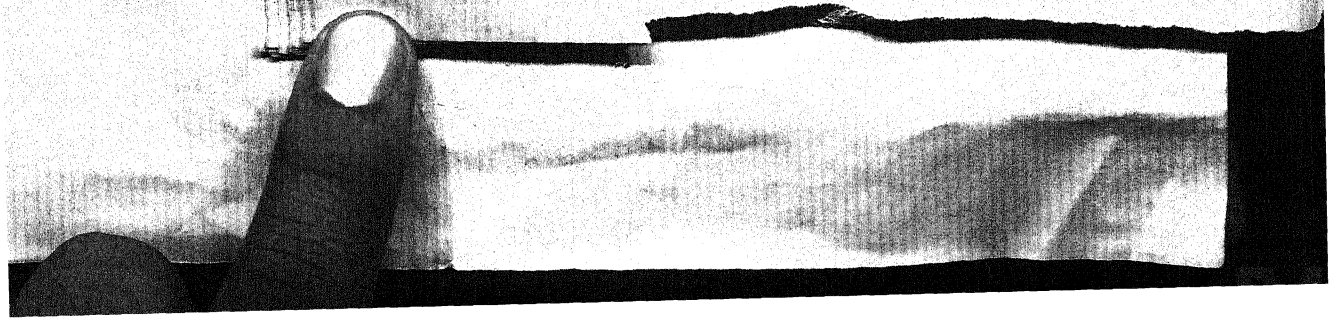
BEAUREGARD, PETER GUSTAVE TOUSSAINT, a gen. of the army of the confederate states of America during the war of secession, was born of a family of Canadian French descent, on his father's plantation, near New Orleans, La., about 1817. He graduated at the military college of West Point in 1838; was appointed to the artillery, and transferred to the engineers; won his brevet of capt. at the battles of Contreras and Churubusco, in Mexico, and of major at Chepultapec, where he was twice wounded. After the Mexican war, he was engaged upon the fortifications on the coast of the gulf of Mexico, and was, for a few days in Feb., 1861, superintendent of the military academy at West Point. At the secession of Louisiana, he resigned, Feb. 20, 1861, and was appointed by the confederate government to the command at Charleston, S. C., where, April 11, he commenced the war by the bombardment of Fort Sumter (q.v.). July 21, he won the battle of Bull Run. March 5, 1862, he took command of the army of the Mississippi, under gen. A. S. Johnston, and on April 6, fought the battle of Shiloh—on the first day a victory, and on the second, when the federals had been reinforced, a partial defeat to the confederates, with the loss of gen. Johnston. After holding gen. Halleck in check for two months, he was obliged, by his failing health, to retire for a time from active service; but in 1863 defended Charleston; and in 1864, commanding at Petersburg, aided gen. Lee in the long and gallant defense of Richmond, the capture of which closed the war. He has since been president of the New Orleans and Mississippi railway; and in 1866, in the interests of the company, he visited New York, London, and Paris, being everywhere received with the highest distinction. He has also been in the service of the khedive of Egypt.

BEAUSOBRE, ISAAC DE, 1659-1738: a Protestant writer of French origin, ordained at the age of 22. Having broken the royal seal put upon a church door to prevent the reformers from exercising their religious rites therein, he was ordered to make the



amende honorable, but declined, and fled to Holland. He was afterwards chaplain to the king of Prussia. Among his works are a defense of the doctrines of the reformation; essays on providence, predestination, grace, and the eucharist; a translation of the New Testament with notes; a curious book on the Adamites of Bohemia; a criticism on Manicheism, and several dissertations on the *Bibliothèque Britannique*.

BEAUTEMPS-BEAUPRÉ, CHARLES FRANÇOIS, 1766–1854; b. France; hydrographer to the expedition sent in search of La Perouse. He made valuable charts of many of the places visited. In 1796, he completed his *Atlas of the Baltic*, and for several years afterwards he labored in connection with marine surveys, making many valuable charts. He became fellow of many scientific societies, and was in active duty in his profession nearly all his life. In England he has been styled "the father of hydrography."

BEAUTY. See ÆSTHETICS, ART.

BEAUVAIS, an important manufacturing French t., capital of the department Oise. It is situated in the valley of the Thérain (a tributary to the Oise), about 41 m. n.n.w. of Paris, and surrounded by rising woodlands. Formerly, B. was included in the old province, Ile de France. It is now the seat of government for the department, and the residence of a bishop, and contains a literary and economical society, a public library, a museum, etc. Among its several fine buildings, the most noteworthy is its uncompleted cathedral, the choir of which is the loftiest as well as one of the finest specimens of Gothic in France. The manufactures of B. include woolen cloths, shawls, carpets, Gobelin tapestry, etc. Pop. '76, 16,591. B. is an ancient town. It was included in the country of the powerful *Bellovaci*, in *Gallia Belgica*, and was known by the Romans as *Cæsaromagus*, afterwards as *Bellovacum*. In the middle ages, it was styled *Belvacum*. In 850, and at other times, B. was desolated by the Normans. The *Jacquerie*, or peasants' war, broke out in the neighborhood of B., Mar. 21, 1358. In 1443, B. was besieged by the English, who were repulsed by the heroic self-sacrifice of Jean Lignière. Again, in 1472, it was besieged by Charles the bold of Burgundy, with an army of 80,000 men, when the women of B., under the leadership of the heroine Jeanne Lainé, surnamed La Hachette for her daring, displayed remarkable valor. The standard which the Burgundians had planted on the wall was torn down by Jeanne Lainé, and borne off by her in triumph. The banner is preserved in the town hall, and a procession, in which it is carried by young girls, annually commemorates the heroic deed. B. is the birthplace of the learned Dominican Vincent de Beauvais (Vincentius Bellovacensis).

BEAVER, *Castor fiber*, a quadruped of the order *glires*, or *rodentia* (q.v.), valued for its fur, and for the peculiar substance called *castoreum* (q.v.), which it yields, and also much noted for its instincts. Some naturalists regard the American B. as distinct from that of Europe and Asia; but the differences observable either in external or anatomical characters are very inconsiderable; and the opinion that a great difference exists in instincts and habits, appears to have been too hastily adopted. If there is only one species of B., it is very widely distributed in the northern regions of the world, reaching in America almost as far s. as the gulf of Mexico. It once existed in the British islands, where, however, it has long been extinct; and it has become rare in Europe, in many parts of which it was once common. It has become rare also in the United States, disappearing before man; but is nowhere so abundant as in that wide region of lakes and rivers which lies to the n. and w. of the settled parts of North America. Considerable numbers of beavers are found on the banks of the Obi and other rivers of Siberia, and in Kamtchatka.

The incisors or cutting teeth of the B. are remarkably strong, and exhibit in the highest degree the distinctive character of the order to which it belongs—the front of hard enamel, which in the B. is of a bright orange color; the back of the tooth formed of a softer substance, more easily worn down, so that a sharp, chisel-like edge is always preserved; the bulbs being also persistent, so that the teeth are continually growing, as by their employment in gnawing wood they are continually being worn away. There are four flat molar teeth (or grinders) on each side in each jaw. Each foot has five toes: those of the fore-feet are short, and not connected by a web; those of the hind-feet are long, spreading out like the toes of a goose, and webbed to the nails. In accordance with this remarkable peculiarity, the B., in swimming, makes use of the hind-feet alone, the fore-feet remaining motionless and close to the body. Another character, to which nothing similar appears in any other rodent, is the large, horizontally flattened tail, which, except at the root, is not covered with hair, like the rest of the body, but with scales. The caudal vertebræ, however, do not exhibit a flattened form.

The B. is usually at least 2 ft. in length, from the nose to the root of the tail; the tail is of an oval form, about 10 in. in length, fully 3 in. in greatest breadth, and scarcely an inch in thickness. These dimensions are sometimes exceeded. The general form of the animal is thick and clumsy, thickest at the hips, and then narrowing abruptly, so that it seems to taper into the tail. The head is thick and broad, the nose obtuse, the eyes small, the ears short and rounded. The fur consists of two kinds of hair; the longer hair comparatively coarse, smooth, and glossy; the under coat dense, soft, and silky. The color is generally chestnut, rarely black, spotted, or nearly white.

The B. is very aquatic in its mode of life, and it seldom wanders far from some lake or river. In consequence of its habits, it is also limited to wooded districts, and the northern range of the species is everywhere terminated by the limits of the wood upon the river-banks.

The food of the B. consists of the bark of trees and shrubs (birch, poplar, willow, etc.), and of the roots of water-lilies (*nuphar luteum*) and other aquatic plants. In summer, it eats also berries, leaves, and various kinds of herbage. There is reason to think that it never, as has been supposed, kills or eats fish. Like some other rodents, it lays up stores of provisions for winter; but these, in the case of the B., consist chiefly of bark, or of branches, and even trunks of trees. Its extraordinary powers of gnawing are exerted to cut down trees of several inches in diameter, both for food, and for the construction of those houses and dams which have rendered it so much an object of admiration to mankind. A tree of 18 in. in diameter has been found thus cut down by beavers, although smaller ones are usually preferred; and when a tree of this size is cut, the branches only, and not the trunk, are employed in the architectural operations of the animals. These operations are very wonderful, although the statement, at one time commonly made, that beavers drive stakes into the ground, has no foundation in fact; and some of the other particulars which passed current along with it, were equally fabulous. The houses or lodges of beavers are grouped together near the edge of the water, the mud being scraped away from the front, so that there may be a sufficient depth of water there to allow free egress, even during the most severe frost. The winter stores of the animals, consisting of piles or heaps of wood, are also always under water, at such a depth that they cannot be locked up in ice. When the depth of water is not sufficient, the beavers construct a dam across the stream, by the side of which the lodge is placed; the dam is sometimes as much as 300 yards in length, convex towards the current, and most convex in the strongest currents, sometimes extending on both sides beyond the natural channel of the stream. The materials of which it is composed are sticks, roots, and branches, with stones, moss, grasses, and mud, strangely commingled, but in such a manner that the structure becomes absolutely water-tight. Branches of which the bark has been used for food, or taken off for winter provender, are very generally employed for building purposes. In their building, beavers interlace small branches with each other and with the larger; and a B. kept in confinement has been known to manifest this instinct, by interlacing branches with the bars of its cage, whilst it also filled the interstices with carrots, and other vegetables, given it for food, nicely bitten to the proper size, and packed in snow, to protect itself from the cold. B. dams are built with the sides inclining towards one another, so that although 10 or 12 ft. wide at bottom, they have a narrow top. The dams and houses are annually repaired, before winter comes on, the work being performed by night. "In places," says Hearne, "which have been long frequented by beavers undisturbed, their dams, by frequent repairing, become a solid bank, capable of resisting a great force, both of water and ice; and as the willow, poplar, and birch generally take root and shoot up, they by degrees form a kind of regular planted hedge, which I have seen in some places so tall that birds have built their nests among the branches." A broad ditch is often dug all around the lodge, so deep that it cannot freeze to the bottom, and into it the beavers make the holes by which they go out and bring their food. The larger lodges are in the interior, about 7 ft. in diameter, and between 2 and 3 ft. high. The top is formed of branches of trees, matted with mud, grass, moss, etc. The walls are very thick, and the whole structure not only secures much warmth, but is a sufficient protection from wolves, wolverines, and other beasts of prey. Different apartments have often one common roof, but they have usually no internal communication. The sleeping-places of the animals are around the wall of their lodge, the center being left free; they are formed merely of a little grass or tender bark of trees. A single house seldom contains more than ten or twelve beavers, but many such families are often congregated in one place. Beavers, both in a wild state and in confinement, are scrupulously cleanly in their habits.

Beavers often sit on the hind-feet and tail, and eat in this posture, holding up the food in their fore-paws. They also walk on the hind-feet, with support of the tail, when they carry materials to their buildings, except branches, which are dragged. They have considerable power in the tail, and not unfrequently flap it, which has given rise to an opinion, perhaps not altogether erroneous, that they use their tails for plastering their buildings, or beating and adjusting the mud which is employed in them.

Beavers do not usually eat in their lodges, but in holes or burrows in the bank of the river, the entrance to which is from beneath the water, and which thence proceed obliquely upwards, often to a distance of many feet. To these holes the beavers also flee when their lodge is broken up; and it is therefore a common practice of the B. hunters to break up the B. lodges, that they may take the animals in their holes or vaults. Beavers are also taken by nets and traps.

It is chiefly in winter that beavers congregate together. During summer, they wander about a little. The young are generally produced in April or May, from two to seven at a birth. Their eyes are open when they are born.

Single beavers are frequently met with, which live apart from all others of their

species. All of these are males, which, it is supposed, have been conquered and driven away by others of their sex.

In the parts of North America where beavers have now become rare, they live mostly in burrows in the river-banks, like those which are still found in Europe. Circumstances prevent them from following out their gregarious tendencies. That the beavers of Europe and Asia construct lodges and dams, when they have opportunity of congregating in sufficient numbers, appears to be no less certain than that those of America do so.

Large glandular pouches, two in number, closely connected with the organs of reproduction, contain the substance called *castoreum* (q.v.). Its uses in the animal economy are by no means well known; they are probably analogous to those of musk, civet, etc.; but its peculiar pungent odor is so attractive to beavers, that use is made of it as a bait for B. traps.

The B. is very easily tamed; but no wooden cage will keep one confined. Except in the extraordinary building instincts already noticed, the animal exhibits no remarkable sagacity.—The use of the B.'s fur for making hats is well known. See HAT. An act of the English parliament, in 1638, prohibiting the use of any other material for hat-making, contributed to the rapid diminution of the number of beavers in the parts of North America from which their skins were then obtained. During great part of the 18th and the earlier part of the 19th c., the number of B. skins annually exported from America appears to have been not less than 200,000. It is now greatly diminished, but is still large. The flesh of the B. is much esteemed as an article of food by trappers and others who frequent the fur-countries, but it is very oily.

Fossil remains of beavers, apparently of the same species with that now existing, are found in the deposits referred by geologists to the pliocene and pleistocene periods. Other remains are also found of a much larger animal of the B. kind, which must have existed in Europe and Asia along with the present species, but which seems to have become extinct before the historic period. They were different, however, not merely in size, but in other particulars so important, that Owen has constituted for the "great B." a distinct genus *trogontherium* (Gr., a chewing or gnawing beast).

Of existing animals, the most closely allied to the B. is the *coypu* (q.v.), sometimes called the Chilian B. (*myopotamus coypus*), which yields the fur called *racoonda* (q.v.).

BEAVER. See HELMET.

BEAVER, a co. in w. Pennsylvania, intersected by the Cleveland and Pittsburg, and the Pittsburg, Fort Wayne and Chicago railroads, 650 m. square. Pop. '80, 55,603. The soil is fertile; products, hay, grain, butter, cheese, etc.; and there are mines of coal and limestone. Co. seat, Beaver.

BEAVER, a co. in s. Utah on the Nevada border, drained by Beaver river; pop. '80, 3,918 A large portion is an arid plain with little water or timber; yet there is considerable agriculture. Iron ore is found. Co. seat, Beaver.

BEAVER DAM, a city in Dodge co., Wis., 61 m. n.w. of Milwaukee, on the Chicago, Milwaukee, and St. Paul railroad, at the outlet of Beaver lake; pop. '80, 3441. It is the market center of a fertile district, with factories, flour-mills, etc.

BEAVER FALLS, a village in Beaver co., Penn., on the Beaver river near its junction with the Ohio, 34 m. n.w. of Pittsburg; on the Pittsburg, Fort Wayne and Chicago, and the Erie and Pittsburg railroads; pop. 5000. There are many manufactories, nearly all of which are controlled by the "Harmony" society of economy.

BEAVER HEAD, a co. in s.w. Montana, on Jefferson river, about 4393 sq.m.; pop. '80, 2,712. The surface is rough. Stock-raising and mining are the main occupations. Co. seat, Bannack city.

BEAVER INDIANS, a tribe on Peace river, in British America, allied to the Chippewas.

BEAVER ISLANDS, in lake Michigan, w. of the straits of Mackinac, forming the co. of Manitou. A band of Mormons settled on the principal island in 1846, but did not long remain there. Chief town and co. seat, St. James.

BEAVERTAIL, in Narragansett bay, the s. extremity of Canonicut island. It has a light-house with fixed white light, 96 ft. above tide, and a fog-horn.

BEAVER WOOD. See MAGNOLIA.

BEBEERINE is one of the alkaloids, and is obtained from the greenheart bark or *bebeeru* of Demerara. It is used in medicine in place of quinine, which it resembles in properties, though it is not so powerful in its action as a tonic and febrifuge. The condition in which it is generally sent into market is as the sulphate of B., occurring in shining scales of a pretty brown color, and soluble in water.

BEBEERU, BEEBEE'RU, or BIBI'RI. See GREENHEART.

BECCAFI'CO, *Sylvia hortensis*, or *Curruca hortensis*, a little bird of the family of the *sylviadæ*, or warblers (q.v.), sometimes called the pettychaps, and sometimes the garden warbler, rather rare in Britain, but abundant in some of the more southern parts of Europe, and in great demand for the table in Italy, its flesh being regarded as of pecu-

liar delicacy. It is a mere summer bird of passage, however, not only in Britain, but even in the s. of Europe. The upper parts are mostly of a brown color, the lower parts whitish. It is a bird of very pleasing song. B. is an Italian name, and is sometimes extended to other birds of the same family used for the table.

BECCAFUMI, or MECHERINO, DOMENICO, b. about 1488, d. 1551; an Italian painter, the son of a peasant. Lorenzo Beccafumi, a rich nobleman, took the boy into his service, and fostered his natural taste for art, by sending him to study in Rome. B. painted many religious pieces for churches, and mythological works for private patrons. He also continued the wonderful pavement in the cathedral of Siena, his native place. For 150 years the best artists worked upon this pavement, which was of white marble, the subject being engraved in black outline, and the border inlaid with rich patterns of many colors. Beccafumi was occupied in this work 27 years. He also made a triumphal arch and an immense mechanical horse for the procession at the entry of Charles V. into Siena.

BECCAMOSCHINO, *Sylvia cisticola*, a little bird of the family of the warblers, found in Italy, and remarkable for its nest, which resembles that of the tailor-birds, being usually placed in a bush of lengthened herbage, the leaves and stalks drawn together over it, and a flooring formed for it by leaves curved across below, and sewed together generally with some kind of vegetable fibers.

BECCARIA, CESARE BONESANA, a political and philanthropic writer, was b. at Milan, 1735 or 1738. The opinions of the French encyclopædists, especially those of Montesquieu, had the greatest influence in the formation of his principles and sentiments. The work which most favorably exhibits the character and genius of Beccaria is his *Trattato dei Delitti e delle Pene* (Treatise on Crimes and Punishments), first published in 1764, in which he argues against the severities and abuses of criminal law, especially capital punishment and torture. The work was extremely popular, and was translated into several European languages. It is marked by eloquence, sensibility, and lively power of imagination. Kant unfairly accuses the author of an affected humanity, though it must be admitted that the German philosopher has exposed the invalidity of some of the arguments brought forward. On the whole, however, the work of Beccaria is acknowledged to have done great good, and the subsequent reforms in the penal code of European nations have generally taken the direction he has pointed out. He was among the first to advocate the beneficial influence of education in lessening crime. This naturally brought upon him the hatred of the priesthood, who, according to their usual formula of persecution, accused him of impiety; but their malice was frustrated by the efforts of count Firmian, the Austrian governor of Lombardy, a man of liberal and enlightened sentiments. In 1768, Beccaria was appointed professor of political philosophy at Milan, and achieved great success as a lecturer. He died of apoplexy in Nov., 1793. In the course of his life he published several works.

BECCARI'A, GIAMBATTISTA, or GIOVANNI BATTISTA, 1716–81; an Italian astronomer and electrician. He was professor of experimental physics at Palermo, Rome, and Turin. In 1775, he was elected a fellow of the royal society of London. In 1759, he was commissioned to measure an arc of the meridian in the neighborhood of Turin. His principal work was *Electricity, Artificial and Natural*.

BEC-FIN, the common French name for different species of birds of the family of *sylviadæ*, or warblers (q.v.). It is sometimes to be met with in English books.

BÊCHE-DE-MER, or TREPANG, an article of luxury among the Chinese, consisting of the dried bodies of several species of *holothuria* (q.v.), or sea-cucumber, which are found in great abundance in the shallow waters of lagoons, and on reefs, from the s.e. coasts of Asia to New Holland. The traffic in bêche-de-mer is very extensive, and the Malays catch the animals, and prepare them in large quantities for the Chinese market. They are usually about 8 or 9 in. long, but some are 2 ft. in length, and 7 or 8 in. in girth. They are often found nearly buried in the coral sand, their feathered tentacula alone floating above it. The larger ones are sometimes speared in shallow water; but most of them are taken by divers in depths of from 3 to 5 fathoms. An expert diver will bring up 8 or 10 at a time. They are split down one side, boiled, pressed flat with stones, dried in the sun, and afterwards in smoke, and packed in bags, in which state they are bought by the Chinese, and conveyed in junks to China. Fleets of Malay proas are employed in the search for this curious production of the sea. Macassar is the great staple-place of the trade, and from it above 8000 cwt. of bêche-de-mer are annually sent to China, the price varying according to the kind and quality, from 30s. to £10 per cwt. There is also a considerable export of bêche-de-mer from Manilla. Bêche-de-mer is extremely gelatinous, and is very much used by the Chinese as an ingredient in rich soups.

BECHER, JOHANN JOACHIM, author of the first theory of chemistry, was b. at Speier in 1625. In his youth he had many difficulties to contend with, but his zeal and perseverance overcame them all. He acquired an extensive knowledge of medicine, physics, chemistry, and even politics, and in 1660, was made a member of the imperial council at Vienna. While residing in this city, he assisted in establishing several manufactures, and drew up the plan of an East Indian commercial society, but unfortunately he fell into disgrace, and had to leave the city. He next went to Mainz, and subsequently

lived in Munich, Würzburg, Haarlem, and finally London, where he died in 1682. He had many enemies, and was accused—not altogether unjustly—of charlatanry. Nevertheless, he rendered important services to chemistry. His *Physica Subterranea* was the first attempt made to bring physics and chemistry into close relation; in these two he sought the causes of all the inorganic phenomena in the world. He at the same time began to construct a theory of chemistry, and also investigated the process of combustion. Becher taught that every metal was composed of an earthy substance common to all metals; of a combustible principle also identical in all; and was differentiated from other metals only by the possession of a peculiar mercurial element; when a metal was heated, until it had changed its form, the mercurial substance was discharged, and nothing remained except metallic calx. Herein lies the first germ of Stahl's phlogistic theory, which obtained universal currency until the time of Lavoisier.

BECHUANS. See BETJUANS.

BECK, JOHN BRODHEAD, 1794–1851; b. N. Y.; a graduate of Columbia college, and professor of materia medica in the New York college of physicians and surgeons. Among his works is *Infant Therapeutics.*

BECK, LEWIS C., 1798–1853; b. N. Y.; brother of John Brodhead; a graduate of Union college; professor of chemistry in Albany medical college; author of works on botany and chemistry, and of an elaborate report on the mineralogy of the state of New York.

BECK, THEODORIC ROMEYN, LL.D., 1791–1855; b. N. Y.; brother of John Brodhead; an American physician; he graduated at Union college, practiced in Albany, and in 1841 was professor of materia medica in the medical college of that city. He was author of *Elements of Medical Jurisprudence.*

BECK, or BEEK, DAVID, 1621–56; a Dutch painter, trained by Van Dyck; and acquiring many of that master's excellences. He was portrait painter and chamberlain to queen Christina of Sweden, with whom he was in high favor. For her gallery he made portraits of nearly all of the sovereigns of Europe.

BECKER, a co. in n.w. Minnesota, at the head of the Red river of the n.; intersected by the Northern Pacific railroad; 1400 sq.m.; pop. '75, 2256. The surface is about 1700 ft. above tide and dotted with lakes. The soil is generally good. Co. seat, Detroit city.

BECKER, GOTTFRIED WILHELM, a German author, b. at Leipsic in 1778, entered the university of that city with the view of studying medicine, and having taken his doctor's degree in 1801, settled there as a practicing physician and a writer of medical works, several of which reached many editions. The wars of the period led him, however, to turn his attention to history and modern languages, and he became well known by his contributions to periodicals, his series of popular histories, and his translations from the English, French, and Italian. In 1833, Becker entirely relinquished practicing medicine, and devoting himself to literature, became a fertile and admired contributor to many of its more popular branches. He died at Leipsic, 17th Jan., 1854. He published several attractive volumes of travels in his own country, peculiarly adapted to the young, among which we may instance his *Tour to the Harz, Sketches of Southern Germany,* etc. His historical writings, which are not less numerous, chiefly narrate the events of his own time. Amongst them we may particularize *Andreas Hofer, Egypt as it Now Is, The Fate of Spain in Modern Times,* etc. In light literature, also, he was very successful as a translator. All his works have been published at Leipsic.

BECKER, HERMAN HEINRICH, b. 1820; a German radical politician, whose extreme views led to his imprisonment for several years after 1848. He has since been a member of the Prussian house of deputies and of the North German parliament, and a leader on the liberal side.

BECKER, JOHN PHILIP, one of the most active radical politicians of late years, was b. Mar., 1809, at Frankenthal, in the Palatinate on the Rhine, and brought up as a brushmaker. The French revolution of July, 1830, gave a political bias to his tendencies, and he took part in the political agitations of the day, in consequence of which he was imprisoned; but in 1833 he was released, and exerted himself warmly on behalf of his brothers in opinion. In 1837, he settled in Switzerland, taking a part in several radical publications, and organizing in 1838 and 1845 volunteer corps. In the autumn of 1847, he was summoned to the military bureau at Berne, and being chosen adjutant of Ochsenbein's division, fought against the Sonderbund with acknowledged bravery. Upon the failure of Hecker's attempt to revolutionize Baden in 1848, Becker, who had organized troops for his support, returned to Switzerland, to plan an expedition of German and Swiss auxiliaries, to support the cause of freedom in Rome and Sicily. Their movements being frustrated, he led his troops in the summer of 1849 into the Palatinate and the duchy of Baden, where a rising had taken place, and acted a prominent part in many engagements. Subsequently, he settled in Geneva, and engaged successfully in commerce. A history of the revolution of 1849, in s. Germany, has been published by him and Esselen. Becker has lately been known as a leader of the socialist party, and is an active agitator on behalf of the association known as the "International."

BECKER, KARL FERDINAND, b. at Leipsic in 1804, may be named with Kiesewetter and Winterfeld, as one of the best German writers on the history of music, and also as an excellent composer for the organ, as is proved by his trios and other compositions well adapted to the genius of the instrument. Among his works may be mentioned: a *Choral-book*, or collection of psalm and hymn tunes (Leipsic, 1844); *Choral Melodies* for Spitta's Psalter and Harp, 1841; a *Catalogue* of his musical library, one of the most extensive in Germany; *On the Choral Collections of Various Christian Churches*, 1841; *The Choral Compositions of the 16th and 17th Centuries*, 1847; and *The Composers of the 19th Century*, 1849. He died Oct., 1877.

BECKER, KARL FERDINAND, one of the most distinguished German philologists, was b. at Liser, in the old electorate of Treves, in 1775. At first a teacher, he afterwards studied medicine, and ultimately settled as a practitioner at Offenbach. Here he educated his own children with such success that several families induced him to take charge of theirs, and thus his house was converted into an academy (1823), which he conducted till his death in 1849. This gave scope to his early predilection for linguistic studies, to which his scientific training led him to give a quite new direction. Becker contemplates language as an *organism*, pervaded by strict logical laws. From this point of view he wrote his *Deutsche Grammatik* (2d ed., 1870). He neglects too much the historical development of language, and thus, as might be expected, comes at times into conflict with the results of comparative philology; yet his work is valuable for its logical consequence, and for its leading idea of organism in language. Besides a *Schulgrammatik* (10th ed. 1872), which is an outline of his larger work, he published several other treatises on the German language.

BECKER, WILHELM ADOLF, a distinguished German author, was b. at Dresden in 1796. Originally intended for commercial life, he soon abandoned a pursuit which he found uncongenial to his tastes, and devoted his time to the acquisition of learning. In 1816, he came to Leipsic, where he studied theology, and more particularly philology. In 1840, he traveled through Italy; and in 1842, was appointed professor of archæology at the university of Leipsic, where his prelections on the Latin authors were numerously attended. He died at Meissen, 30th Sept., 1846. His lively fancy, aided by a thorough knowledge of the classic languages, enabled him to make quite a novel use of antiquity. In his *Charicles* (Leip. 1840), he ventured to reproduce the social life of old Greece; and in his *Gallus* (Leip. 1838), to give sketches of the Augustan age at Rome. The learning which he has contrived to stuff into his picturesque sentences is marvelous, not to speak of the quantity buried in his *excursus*, or disquisitions, which in the English translation of the works by Metcalfe, are transferred from the text to the end of the volumes. Lockhart's *Valerius* is the only thing in English literature which corresponds to these compositions of the German author. Becker's treatise, *De Comicis Romanorum Fabulis* (Leip. 1837), is a valuable contribution to the history of Roman dramatic poetry. His most important work, in a scholastic point of view, is his *Hand-book of Roman Antiquities* (1843–46), which, after his death, was continued by Marquardt.

BECKERATH, HERMANN VON, one of the most remarkable public characters of Germany, was born at Krefeld (in Prussia,) Dec., 1801. He sprang from a commercial family, and made a considerable fortune as a banker. But he gave himself also to pursuits of a more intellectual character, and especially to the studies of jurisprudence and politics. The accession of Frederick-William IV. to the throne roused B. to a sense of the political condition of his country, and he devoted himself to work out its constitutional freedom. In 1843, he was elected representative of his native town in the provincial diet, and continued for several years to take a prominent part in Prussian politics. He was a deputy in the national assembly which sprang up in the eventful year 1848, and held its sittings at Frankfort. His eloquence exercised considerable influence on this assembly. He was appointed minister of finance, and shortly after called to Berlin, to construct a cabinet; but in this he failed. His strictly constitutional advice was not apparently agreeable to the court, and he returned to Frankfort. An advocate for German unity, it was he who made use of the expression: "This waiting for Austria is death to the union of Germany." But he refused his assent to any revolutionary measure. When the retrograde movement set in, he resigned the posts he held under government, but continued, as a member of the second Prussian chamber, a vigorous opposition to the Manteuffel ministry, which had deserted the cause of German unity. He withdrew from the arena of political strife in 1852. After the return of Manteuffel to power, in 1858, B. was again elected a member of the Prussian second chamber: but he was obliged to decline the honor, on account of failing health. He devoted his later years to the affairs of Krefeld, his native town, where he died in May, 1870.

BECKET, THOMAS À., archbishop of Canterbury, was the son of a merchant, and was born in London in 1119. The story which makes his mother a Saracen is charmingly romantic, but there are doubts if it has any historical basis. He studied theology at Oxford and Paris, and afterwards law at Bologna, and at Auxerre, in Burgundy. Having been recommended to Henry II. by Theobald, archbishop of Canterbury, who had had experience of his abilities, B. was promoted to the office of high chancellor, and thus (according to Thierry) resuscitated the hopes of the English as the first native Englishman, since the Conquest, who had filled any high office. His duties as high chancellor

were numerous and burdensome, but he discharged them vigorously. He was magnificently liberal in his hospitality. Henry himself did not live in a more sumptuous manner. As yet, B. seems to have regarded himself as a mere layman, though, in point of fact, he was a deacon; but in 1162, when he was created archbishop of Canterbury (an office which, as it then involved the abbacy of the cathedral monastery, had never but twice before been held by any but a monk or canon-regular), a remarkable change became manifest in his whole deportment. He resigned the chancellorship, threw aside suddenly his luxurious and courtly habits, assumed an austere religious character, exhibited his liberality only in his "charities," and soon appeared as a zealous champion of the church against all aggressions by the king and the nobility. Several noblemen and laymen were excommunicated for their alienation of church property. Henry II., who, like all the Norman kings, endeavored to keep the clergy in subordination to the state, convoked the nobility with the clergy to a council in 1164 at Clarendon (near Salisbury), where the so-called "constitutions" (or laws relative to the respective powers of church and state) were adopted. To these, the primate, at first, declared he would never consent; but afterwards, through the efforts of the nobles, some of the bishops, and, finally, of the pope himself, he was induced to give his unwilling approbation. Henry now began to perceive that B.'s notions and his were utterly antagonistic, and clearly exhibited his hostility to the prelate, whereupon B. tried to leave the country. For this offense the king charged B. with breach of allegiance, in a parliament summoned at Northampton in 1164, confiscated his goods, and sequestered the revenues of his see. A claim was also made on him for not less than 44,000 marks, as the balance due by him to the crown when he ceased to be chancellor. B. appealed to the pope, and next day leaving Northampton in disguise, fled to France, where he spent two years in retirement at Pontigny, in Burgundy. The French monarch and the pope, however, now took up his cause. B. went to Rome, pleaded personally before his holiness, who reinstated him in the see of Canterbury. B. now returned to France, whence he wrote angry letters to the English bishops, threatening them with excommunication. Several efforts were made to reconcile Henry and B., which, however, proved futile; but at length, in 1170, a formal agreement was come to at Fretville, on the borders of Touraine. The result was, that B. returned to England, entering Canterbury amid the rejoicings of the people, who were unquestionably proud of B., and regarded him—whether wisely or not is another question—as a shield from the oppressions of the nobility; but he soon manifested all his former boldness of opposition to royal authority. At last, it is said, the king, while in Normandy, expressed impatience that none of his followers would rid him of an insolent priest. The fatal suggestion was immediately understood, and carried into effect by four barons, who departed by separate ways for England. On the evening of the 29th Dec., 1170, they entered the cathedral, and having failed in an attempt to drag him out of the church, there slew B. before the altar of St. Benedict, in the n. transept. Henry was compelled to make heavy concessions to avoid the ban of excommunication. The murderers, having repaired to Rome as penitents, were sent on a pilgrimage to Palestine; and, two years after his death, B. was canonized by pope Alexander III., and the anniversary of his death was set apart as the yearly festival of St. Thomas of Canterbury. In 1220, his bones were raised from the grave in the crypt where they had been hastily buried two days after his murder, and were by order of king Henry III. deposited in a splendid shrine, which for three centuries continued to be the object of one of the great pilgrimages of Christendom, and still lives in English literature in connection with Chaucer's *Canterbury Tales*. At the reformation, Henry VIII. despoiled the shrine, erased B.'s name from the calendar, and caused his bones to be burnt and scattered to the winds. It is extremely difficult to estimate properly the character of Becket. We do not know what his ultimate aims were, whether, as some suppose, they were patriotic, i.e., *Saxon*, as opposed to *Norman*, or, as others believe, purely sacerdotal. At all events, the means he used for the attainment of them was a despotic and irresponsible ecclesiasticism. He admitted nothing done by churchmen to be secular, or within the jurisdiction of civil courts, not even murder or larceny. Fortunately, the Plantagenets were as dogged believers in their own powers and privileges as B. in those of the church; and by their obstinate good sense, England was kept wholesomely jealous of the pretensions of Rome. See Dr. Giles' *Vita et Epistolæ S. Thomæ Cantuariensis*; canon Morris' *Life of St. Thomas Becket;* canon Robertson's *Life of Becket;* canon Stanley's *Historical Memorials of Canterbury;* Freeman's *Historical Essays*; Hook's *Lives of the Archbishops of Canterbury*; Froude's articles on B. in the *Nineteenth Century*.

BECKETS, on shipboard, a general name for any large hooks, short pieces of rope, or wooden brackets, used for confining ropes, tackles, oars, or spars in a convenient place.

BECKFORD, WILLIAM, the only legitimate son of alderman Beckford, was b. in 1760. When he was about 9 years of age, his father died, and he inherited the larger portion of an enormous property, consisting for the main part of estates in Jamaica, and of the estate of Fonthill, in Wiltshire. His annual revenue is said to have exceeded £100,000. Young Beckford evinced unusual intellectual precocity; for in 1780 he printed a satirical essay, entitled *Biographical Memoirs of Extraordinary Painters*, in which he does not spare living artists, and assails the cant of criticism with the polished

weapon of his wit. In 1778, he visited the continent, and met Voltaire at Paris. Two years thereafter, he started on his first great continental tour, and spent twelve months in rambling through Flanders, Germany, and Italy. In 1782, he made a second visit to Italy, and in 1787 he wandered through Portugal and Spain. In 1783, he married the lady Margaret Gordon, daughter of Charles, fourth earl of Aboyne, and in the following year he entered parliament as one of the members for Wells. In the same year, he published *Vathek* in French. Beckford informs us that he wrote this tale, as it now stands, at 22 years of age, and that it was composed at one sitting. "It took me," he says, "three days and two nights of hard labor. I never took off my clothes the whole time. This severe application made me very ill." Immediately on its publication, *Vathek* was translated into English; Beckford professes never to have known the translator, but thought his work well done. In 1790, he sat for Hindon; in 1794, he accepted the Chiltern Hundreds, and again left England. He fixed his residence in Portugal, purchased an estate near Cintra, and occupied for a time that "paradise" which Byron commemorated in *Childe Harold*. Tormented by unrest, he returned to England; and in 1801, the splendid furniture of Fonthill was sold by auction, and the next year his valuable collection of pictures was disposed of in London. These dispersions were no sooner made than he began a new collection of books, pictures, furniture, curiosities, and proceeded to erect a new building at Fonthill, the most prominent feature of which was a tower above 260 ft. high. Beckford resided at Fonthill till 1822, when in one of those strange vagaries of feeling, of which his life was so full, he sold the estate and house, with all its rare and far-gathered contents, to col. Farquhar for £350,000. Soon after, the great tower, which had been raised on an insecure foundation, came to the ground. On the sale of Fonthill, Beckford removed to Bath, and immediately proceeded to erect another lofty building, the plan of which also included a tower, but this time not more than 100 ft. high. While residing there, he did not mingle in Bath society, and the most improbable stories concerning the rich and morose genius in their neighborhood were circulated among the citizens, and were believed by them. During all his life, Beckford was a hard-working student, and was devoured by a passion for books. Some of his purchases were perfectly imperial in their way. He bought Gibbon's library at Lausanne, to amuse himself when he happened to be in that neighborhood. He went there; read in the fierce way that he wrote, three days and two nights at a sitting; grew weary of his purchase; and handed it over to his physician, Dr. Scholl. Up till 1834, he had published nothing since *Vathek*; but in that year the literary silence of half a century was broken by the appearance of a series of letters, entitled *Italy, with Sketches of Spain and Portugal*, in two volumes. In the same year he republished his *Memoirs of Extraordinary Painters;* and in 1835, he issued another volume, entitled *Recollections of an Excursion to the Monasteries of Alcobaca and Batalha*, made in June, 1794. From the period of this last publication till his death, which took place on the 2d of May, 1844, he lived in the deepest retirement.

Beckford, since the publication of his Arabian tale, has been a power in English literature. His wit, his sarcasm, his power of graphic description, may be seen in his journal and letters; and his higher faculties of imaginative conception and delineation reign in the unmatched passages that shadow forth in gloom and glory the "Hall of Eblis."

BECKMANN, JOHANN, a German author, known by his works on natural history and agriculture, was b. at Hoya, in Hanover, June 4, 1739. After holding, for about two years, a professorship of physics and natural history in St. Petersburg, he made a tour through Sweden, where he gained an acquaintance with the working of mines, and received for some time instructions from Linnæus. In 1766, he was appointed professor of philosophy, and in 1770 ordinary professor of political economy at Göttingen, where he died, Feb. 4, 1811. He was the first German author who wrote on agriculture in a scientific style. Among his works may be mentioned: *Principles of German Agriculture* (6th ed. 1806), *Introduction to Technology* (5th ed. 1809), *Introduction to the Science of Commerce* (1789), and *Contributions to the History of Inventions* (1780–1805).

BECKX, PIERRE JEAN, b. Belgium, 1795; a general of the order of Jesuits. He became a member of the society of Jesus in 1819, and was the head of the order in 1853. Soon after receiving orders, his superiors recognized his rare abilities, and sent him on several delicate missions. When the duke Ferdinand of Anhalt-Köthen became a convert to the Roman Catholic religion, young Beckx was appointed his confessor, and he officiated for some years as priest of the new church which was built at Köthen. After the death of the duke, B. continued at the court with the widow, the countess Julia, whom, at a later period, he accompanied to Vienna. In 1847, he became procurator for the province of Austria, and in this capacity he went to the college of procurators at Rome. In the following year the Jesuits were temporarily driven from Austria, and consequently father B. went to Belgium, where he was nominated rector of the Jesuit college at Louvain. When the Jesuits were re-established in Austria, he zealously supported the projects of the government, which were highly favorable to the interests of the church. He lent his powerful aid to the primate of Hungary, cardinal Szeitowsky, who succeeded in obtaining the reinstatement of the Jesuits in that portion of the empire, and in founding the noviciate at Tyrnau. Being sent to the assembly at Rome

in 1853, to choose a successor to father Roothan, he was elected superior of the order. The success of the Jesuits since that time, especially in non-Catholic countries, is due, in no slight degree, to the ability and foresight of father B. Besides some minor writings and occasional discourses, he has published a *Month of Mary*, which has passed through numerous editions, and been translated into many languages.

BECQUEREL, ANTOINE CÉSAR, a distinguished French physicist, was b. 7th Mar., 1788, at Chatillon-sur-Loing, in the department of Loiret. In 1808, he entered the French army as an officer of engineers, and served with distinction in Spain under marshal Suchet. He took part in the sieges of Tortosa, Tarragona, Valencia, and other places. On his return to France, he was appointed inspector of the *Ecole Polytechnique;* in 1814, he went through the campaign of France; and at the peace of 1815, retired from the service, that he might pursue his scientific studies with greater advantage. In 1819, he published a volume of geological and mineralogical researches, after which, his attention was principally devoted to electricity and magnetism. While studying the physical properties of yellow amber, B. had occasion to make experiments on the liberation of electricity by pressure. This led him to investigate the laws by which the phenomena of liberation are governed in chemical action. The result of his inquiries was the overthrow of Volta's theory of contact, and the construction, by him, of the first constant pile. He next discovered a method of determining the internal temperature of human and animal bodies, and by physiological applications demonstrated that, when a muscle contracts, there is a development of heat. B. is besides one of the creators of electro-chemistry. His labors in this branch of science opened for him, in 1829, the door of the *Académie de Sciences*. Since 1828, he had begun to apply electro-chemistry in the reproduction of mineral substances, and in the treatment by the humid way of silver, lead, and copper ores. In 1837, he was elected a member of the royal society of London. Among his works were the *Traité de l'Electricité et du Magnetisme; Traité d'Electro-chémie; Traité de Physique; Éléments de Physique terrestre et de Météorologie.* He died on the 19th Jan., 1878.—BECQUEREL, ALEXANDRE EDMOND, son of Antoine César B., an eminent physicist, was b. at Paris, 24th Mar., 1820. He was decorated with the legion of honor in 1851, and was appointed professor of physics in the *Conservatoire des Arts et Métiers*, 1853. He is a member of the *Académie des Sciences*. To his conjoint labors with his father are due interesting researches concerning the solar spectrum, and the elements of electric light (*Comptes Rendues de l'Académie*, 1839–40); *Eléments de Physique Terrestre et de Météorologie* (1847); *Memoires sur les Lois qui président à la Decomposition électro-chimique des Corps* (1849); and a *Note sur le tracé des Lignes Isothermes en France; des Recherches sur les Effets Electriques* (1852 and 1855); and *La Lumière, ses Causes et ses Effets* (1868).

BECSE, NEW, a market t. of Austria, about 4 m. e. from Old Becse. Pop. 6472.

BECSE, OLD, a market t. of the Austrian empire, in the Servian Woiwodschaft, 24 m. n.n.e. from Neusatz. Pop. 11,222.

BECSKEREK' NA'GY, or GREAT BECSKEREK, a t. of Hungary, in the co. of Torontal, situated on the left bank of the Bega, about 45 m. s.w. of Temesvar, with which place it is connected by canal. B. N. is an important market t., and has a pop. (1869) of 19,666.

BED (with some variations in spelling, the word is common to all Germanic languages), an article of household furniture on which to sleep. Beds have been and are of various forms, almost every country having its own kind of bed. In ancient times in Palestine, the B. seems to have been a simple kind of couch for reclining on during the day, and sleeping on at night, and readily removable from place to place, as is referred to in different parts of Scripture. About the heat of the day, Ishbosheth lay on his B. at noon (2 Sam. iv. 5). In receiving visitors, the king bowed himself upon the bed (1 Kings i. 47). Jesus saith, "Take up thy B., and go unto thine house" (Matt. ix. 6). Yet in these early times, beds or couches must, in some instances, have been highly ornamented: thus, "I have decked my B. with coverings of tapestry, with carved works, with fine linen of Egypt" (Prov. vii. 16). The ancient Greeks had an elegant kind of beds in the form of open couches; they rested on a frame-work with posts; their mattresses were stuffed with wool or feathers; and they had coverings of a costly nature. The Romans had latterly beds of great richness and magnificence. They were of two kinds—the *lectus triclinìaris*, or couch for reclining upon at meals; and the *lectus cubiculàris*, or B. placed in bed-chambers for sleeping in during the night. In eastern countries, at the present day, beds are for the most part simple couches or mattresses, which can be easily rolled up and carried away. In India, these couches are called *charpoys*. It will be understood that, in hot climates, few bedclothes are used—in general, there being only a single sheet employed; care is taken, however, to use mosquito-curtains, without which rest would be impracticable. See MOSQUITO.

Throughout the continent of Europe, beds are of the open couch form, suitable in width for one person. They consist of a frame or bedstead, less or more ornamental, bearing one or two hair or wool mattresses; they are often provided with curtains, which depend from the ceiling of the room. In French hotels, such beds, neatly done up, are seen in sitting-rooms. In Germany, there is a common practice of placing large

flat bags of down above the other coverings of beds, for the sake of warmth; and sometimes a bed of down altogether supplies the place of blankets. Throughout America, the beds are usually of the French, or open couch, form. The simplest kind of B. yet invented—except, indeed, the oriental rug spread on the floor—is one frequently to be seen in America. The bedstead consists of a folding trestle, constructed with canvas on the principle of a camp-stool, with a movable head-board at one end to retain the pillow. With a hair-mattress, a pillow, and the necessary coverings laid on it, this makes one of the most comfortable beds imaginable. Its great advantage consists in its being easily folded up and put away in small space. In some of the hotels in the United States, when the arrival of guests exceeds the ordinary accommodation, a number of trestle-beds can be improvised in a few minutes in one of the large halls.

To prevent the falling of dust on the face, the Romans, in same instances, used canopies (*aulæa*) over their beds; in no country but England, however, has the canopied bedstead been thoroughly perfected and naturalized. The English four-posted B., or B. proper, is a gigantic piece of furniture, to which all persons aspire; and when tastefully fitted up, it offers that degree of comfort and seclusion which is characteristic of the domestic habits of the people. Like most English beds, it is made of sufficient size to accommodate two persons—the husband and wife—and is hence known as the family-bed. The dimensions of a good family B. are as follows: lying part, 6 ft. 6 in. in length, by 5 ft. 2 in. in breadth; height from the floor, 2 ft. 9 in.; height of the posts from the floor to the top of the cornice, 9 feet. The roof or canopy is supported by the four posts, which are of mahogany, finely turned and carved. On rods along the cornice, hang curtains, which can be drawn around the sides and foot. The top stands towards the wall, so that the B. can be approached on the two sides. The curtains are composed of silk or worsted damask; in old times, they were of tapestry. With a spring-mattress below, and a wool-mattress above, the B. is complete, all but the blankets, sheets, bolster, and pillows. Ticks with feathers, laid on a hair-mattress, are also common. Fully equipped, a B., as just described, costs from £50 to £80. The great B. at Ware, in Hertfordshire, is one of the curiosities of England, and is referred to in the *Twelfth Night* of Shakespeare: "Although this sheet were big enough for the bed of Ware in England." The famous B., which is still seen in one of the inns at Ware, measures 12 ft. square, and is said to be capable of holding a dozen persons.

Latterly, a species of B. has been introduced into England, called the Elizabethan bed. In point of size, it resembles the four-poster, but it has only two tall posts, with a canopy and curtains at the head, leaving more than half of the B. exposed. The tent B. is an inferior kind of four-poster; it has a semicircular light frame roof, and light calico curtains. A more novel variety of bedsteads are those made of iron or brass, formed like open couches, which have come into very general employment. The cold and humid climate of the British islands, independently of the habits of the people, has greatly influenced the form of the B.; for although it may be more wholesome to sleep without than with curtains, it has been difficult to make the practice of doing so general, particularly during the winter and spring months. In the humbler class of rural cottages in Scotland, there still lingers the old custom of sleeping in wooden bedsteads with sliding doors. This box variety of B. is considered as unfavorable to ventilation, but it is the only kind of sleeping-place which is endurable where there are damp earthen floors and imperfect ceilings. Its use is disappearing in the progress of cottage improvement.

In old times in England, beds were formed with straw instead of wool, hair, or feathers, as at present; hence the phrase of a "lady in the straw," signifying that she is being confined. By the humbler classes in the rural districts, straw is still used for beds, and also ticks stuffed with chaff. According to an old superstition, no person could die calmly on a B. of feathers of game birds.

For invalids, there have been invented air-beds and water-beds, which are now in use, and justly appreciated. See AIR-BEDS, also WATER-BED.

BED, or STRATUM, is a layer of sedimentary rock of similar materials, and of some thickness, cohering together so as to be quarried and lifted in single blocks. Beds are often composed of many fine laminæ or plates. The laminæ are the results of intermissions in the supply of materials, produced by such causes as the ebb and flow of the tide, river-floods, or the more or less turbid state of the water under which they were deposited. When the intervals between the supply of materials were short, the numerous laminæ closely adhere, and form a bed cut off from the superior deposit, by the occurrence of a longer interval, during which the bed became consolidated more or less before the next was deposited. When the lamination is obscure, or not distinct from the stratification, it would seem to indicate that the materials had been supplied without any intermission.

BEDA, or BEDE (surnamed, on account of his learning, piety and talents, VENERABLE), the greatest name in the ancient literature of Britain, and probably the most distinguished scholar in the world of his age, was b. about the year 673 A.D. The exact spot of his birth is a point in dispute among antiquaries, but is commonly believed to have been in what is now the parish of Monkton, near Wearmouth, in Durham. In his seventh year he entered the neighboring monastery of St. Peter, at Wearmouth, where

he remained for 13 years, and was educated under the care of the abbot Benedict Biscop, and his successor, Ceolfrid. His religious instructor was the monk Trumberct; his music-master, John, chief-singer (*archicantor*) in St. Peter's Church, Rome, who had been called to England by the abbot Benedict. After these studies at Wearmouth, B. removed to the twin-monastery of St. Paul at Gyruum (now written Jarrow), founded in 682; here he took deacon's orders in his nineteenth year, and was ordained priest in his thirtieth, by John of Beverley, then bishop of Hexham. In the shelter of his quiet and sacred retreat, while the tempest of barbaric strife raged without, and the hearts of all men in England were torn by sanguinary passions, B. now began earnestly to consecrate his life to such literature as was possible in those days, including Latin and Greek, and at least some acquaintance with Hebrew, medicine, astronomy, and prosody. He wrote homilies, lives of saints, hymns, epigrams, works on chronology and grammar, and comments on the books of the Old and New Testament. His calm and gentle spirit, the humanizing character of his pursuits, and the holiness of his life, present a striking contrast to the violence and slaughter which prevailed in the whole island. To none is the beautiful language of Scripture more applicable—"a light shining in a dark place." When laboring under disease, and near the close of his life, he engaged in a translation of St. John's gospel into Anglo-Saxon, and dictated his version to his pupils. He d. May 26, 735, and was buried in the monastery of Jarrow: long afterwards (in the middle of the 11th c.), his bones were removed to Durham. His most valuable work is the *Historia Ecclesiastica Gentis Anglorum*, an ecclesiastical history of England, in five books, to which we are indebted for almost all our information on the ancient history of England down to 731 A.D. B. gained the materials for this work partly from Roman writers, but chiefly from native chronicles and biographies, records, and public documents, and oral and written communications from his contemporaries. King Alfred translated it into Anglo-Saxon. In chronology, the labors of B. were important, as he first introduced the Dionysian reckoning of dates in his work, *De Sex Ætatibus Mundi*, which served as a basis for most of the mediæval chroniclers of leading events in the world's history. Among the editions of B.'s history may be noticed: the first, published at Strasburg about 1500; a much better edition, by Smith (Cambridge, 1722); one not less valuable, by Stevenson (Lond., 1838); another, by the late Dr. Hussey (Oxf., 1846); a fourth in the *Monumenta Historica Britannica* (Lond., 1848); and that included by Dr. Giles in his edition of the whole works of B., with an English translation of the historical parts (6 vols., Lond., 1843–44). Entire editions of B.'s writings have been published in Paris (1544–54), Basel (1563), and Cologne (1612 and 1688). English versions of his *Ecclesiastical History* were published by Stapleton, in 1565; by Stevens, in 1723; by Hurst, in 1814; by Wilcock, in 1818; and by Giles, in 1840. See Gehle's *De Bedæ Venerabilis Vita et Scriptis* (Leyden, 1838); Wright's *Biographia Britannica Litteraria*, vol. i. (Lond., 1843); Surtees's *History of Durham*, vol. ii., pp. 2 to 6, 66 to 69.

BEDARIEUX, a t. of France, department of Herault, situated on the river Orb, well built, and second to none of its size in industry. Pop. '76, 7372, who are engaged in the manufacture of fine and coarse cloths, stuffs, cotton and woolen stockings, hats, paper, oil, soap, leather, etc.

BEDCHAMBER, LORDS OF THE, officers in the British royal household, twelve in number, who, in the reign of a king, wait in turn upon the sovereign's person. They are under the groom of the stole, who attends his majesty only on state occasions. There are also thirteen grooms of the B., who take their turns of attendance. The salary of the groom of the stole is £2000; of the lords of the B., £1000; and of the grooms, £500 a year. These offices in the reign of a queen are performed by ladies. Corresponding to the groom of the stole is the mistress of the robes, and to the grooms of the B. are B. women. Her majesty, queen Victoria, has usually had from ten to twelve ladies and extra ladies of the B., and eight B. women. These offices are objects of high ambition, from the access they give to the person of the sovereign, and are for the most part filled by "the prime nobility of England." They are not usually vacated on a change of ministry, and sir Robert Peel's departure from the usual etiquette on this point, in 1839, excited no small commotion.

BEDDOES, LOVELL THOMAS, eldest son of Dr. Thomas B., and of Anna, third daughter of Richard Lovell Edgeworth, of Edgeworthstown, Ireland, sister of Maria Edgeworth, the distinguished novelist, was b. at Rodney place, Clifton, on the 20th July, 1803. In 1809, Dr. Beddoes died, leaving his son to the guardianship of Mr. Davies Giddy, who, under his after-name of sir Davies Gilbert, became the president of the royal society. By this gentleman, young B. was placed at the Bath grammar school; from thence, in 1817, he removed to the Charter house; and in May, 1820, he entered as a commoner at Pembroke college, Oxford. In 1821 he published the *Improvisatore*. On this, his earliest poetic offspring, he looked with no favor at a later period, and was wont to hunt after stray copies in the libraries of his friends, and to disembowel them mercilessly when he effected a capture. In 1822, he published *The Bride's Tragedy*, which achieved for its author a great reputation. In 1824, he went to Göttingen to study medicine, and from this time forth continued to live in Germany and Switzerland, with occasional visits to England. While engaged at Frankfort (1847) in dissecting, he received a slight wound, which was the means of infusing a noxious virus into his sys-

tem. His health now began to fail. In 1848, he went to Basel, where he fell from his horse, and injured his leg. An amputation following, he died on the 26th Jan., 1849, and was buried in the cemetery of the hospital.

During his wanderings in Germany, B. was engaged at intervals in the composition of a drama entitled *Death's Jest-book*. This work, together with his other manuscripts, consisting chiefly of poetry, he, on his death-bed, confided to the care of a friend in England, desiring him to use his discretion as to their publication. In consequence, in 1851, his poetical works, with a memoir attached, appeared in two volumes. The merits of these dramatic fragments are quite peculiar. The author exhibits no power of characterization, no ability in the conduct of a story; and, on the other hand, the crush of thought and image, the tone of music, and the depth of color, are quite wonderful. Mr. B. never could have become a dramatist, and of this, during his later years, he seems to have become aware. His works pall with splendor, and are monotonous by very richness. They are like a wilderness where nature has been allowed to pour herself forth in all her waste and tropical excess, unrestrained by a pruning hand, and unpierced by any path.

BEDDOES, THOMAS, a physician of remarkable talents, and a popular writer on chemistry, physics, physiology, disease, etc., was b. at Shiffnall, in Shropshire, 1760. In his studies at Oxford and Edinburgh, he distinguished himself by his knowledge of ancient and modern languages—the modern he acquired without the aid of a teacher—and by his varied attainments in botany, mineralogy, geology, chemistry, etc. In Edinburgh he attracted the notice of Dr. Cullen, who employed him to add notes to Bergman's *Physical and Chemical Essays*. In 1785, he published a translation of Bergman's *Essays on Elective Attractions*, with valuable original notes. In 1787, he was appointed to the chemical lectureship in the university of Oxford. Here his lectures became exceedingly popular; but his unconcealed sympathies with the French revolutionary party in England, appear to have rendered his post so uncomfortable that he resigned it in 1792, and retired into the country. While in retirement, he wrote his work *On the Nature of Demonstrative Evidence, with an Explanation of Certain Difficulties Occurring in the Elements of Geometry*, which was intended to show that mathematical reasoning proceeds entirely on the evidence afforded by the senses, and that geometry is based on experiment. Several patriotic pamphlets followed, and the *History of Isaac Jenkins*, in which he laid down, in a popular style, rules of sobriety, health, etc., for the benefit of the working classes. Of this work, 40,000 copies were sold in a short time. In 1798, after having spent considerable time in studying the use of artificial or medicated gases in the cure of diseases, especially consumption, aided by his father-in-law, Mr. Edgeworth, and pecuniarily assisted by his friend, Thomas Wedgwood, he opened a pneumatic hospital at Bristol. This institution did not succeed in its main object, which was to show that all diseases being, as B. maintained, referrable to an undue proportion or deficiency of some elementary principle in the human organism, could be cured by breathing a medicated atmosphere; and B., whose zeal had abated, retired from it about a year before his death, in 1808. The only results of the enterprise were several works by B. on the application of medicated air to diseases, and the introduction to the world of Davy (afterwards sir Humphry), who was the superintendent of the institution. Sir Humphry Davy says of B.: "He had talents which would have exalted him to the pinnacle of philosophical eminence, if they had been applied with discretion." A life of B. was published in 1811 by Dr. Stock.

BEDEAU, MARIE ALPHONSE, a distinguished French gen., was b. at Vertou, near Nantes, Aug., 1804. In 1817, he entered the military school of La Flèche; in 1820, St. Cyr; and in 1825 received a commission in the army. In the Belgian campaign of 1831–32, he was aid-de-camp to gen. Gérard, and attracted notice at the siege of Antwerp. In 1836 he was sent to Algeria, as commandant of a battalion of the foreign legion. Here he acquired his great military reputation. He took part in most of the military operations by which the dominion of France was established over the natives, and rose to the rank of gen. of brigade. In 1847, he was for a short time governor of Algeria, but was superseded by the duc d'Aumale.

When the revolution of Feb. broke out, B., who was in Paris on leave of absence, was commissioned by marshal Bugeaud to suppress the insurrection. This he found it impossible to do, but his conduct on the occasion has been severely blamed. By the provisional government he was appointed minister of war, an office, however, which he immediately changed for the command of the city of Paris. On the formation of the constituent assembly, he was named vice-president, and always voted with the republican party. Along with Cavaignac, Lamoricière, and others, he was arrested on the 2d Dec., 1851, and went into exile. B. was a Roman Catholic, and the fervor of his convictions gave rise to the groundless rumor that he had entered into holy orders. He died in 1863.

BEDEGUAR, a remarkable gall (q.v.) often found on the branches of various species of rose, particularly of the sweet-brier, upon which account it is sometimes called sweet-brier sponge. It is produced sometimes by *cynips rosæ*, sometimes by other species of gall insect. It is usually of a roundish shape, often an inch or more in diameter; its nucleus is spongy and fibrous, containing numerous cells, in each of which is a small

larva; externally it is shaggy, being covered with moss-like branching fibers, which are at first green, afterwards purple or red. It was formerly in some repute as a diuretic and as a remedy for stone; it has more recently been recommended as a vermifuge, and as a cure for toothache.

BEDELL, Gregory Thurston, D.D., b. N. Y., 1817; son of Gregory Townsend; educated in Bristol college, Penn.; was rector of the Protestant Episcopal church of the Ascension in New York city from 1843 to 1859, when he was chosen bishop of Ohio. Among his works are *The Divinity of Christ, The Profit of Godliness, Principles of Pastorship, Sacredness of the Grave, The Age of Independence*, etc.

BEDELL, Gregory Townsend, D.D., 1793–1834; b. N. Y.; a clergyman of the Protestant Episcopal church; graduated at Columbia college, and won high position as a preacher. He published *Onward, or Christian Progression, Renunciation, Haymarkets, Ezekiel's Vision, Bible Studies*, sermons, etc.

BEDELL, William, one of the best prelates that have adorned the English church, was b. at Black Notley, Essex, in 1570. He was educated at Emmanuel college, Cambridge, and after his ordination, officiated as a clergyman for several years at Bury St. Edmunds. In 1604, he accompanied Sir Henry Wotton as his chaplain to Venice. There he resided 8 years, deeply engaged in study, and honored by the friendship of many distinguished men, in particular of father Paul Sarpi, then engaged in the composition of his celebrated *History of the Council of Trent*. While residing here, he translated the English *Common Prayer Book* into Italian, which was highly appreciated by many of the Venetian clergy. On his return home, he resumed his pastoral duties at Bury, where he lived for some time in such retirement, that when his friend Diodati came to England, he inquired in vain for the admirable B., whose merits were so well known at Venice. He had given up hopes of finding him, when one day he encountered him in the streets of London. In 1615 B. was presented to the living of Horingsheath, in Suffolk, where he remained 12 years. His retired life and his Calvinistic theology long hindered the recognition of his merits. At length, in 1627, he was unanimously elected provost of Trinity college, Dublin, to which the fame of his learning and piety had extended. He refused to undertake the charge till positively commanded by the king. At the end of two years, he was promoted to the united bishoprics of Kilmore and Ardagh, the latter of which he resigned in the following year, 1630. He immediately set himself to reform the crying abuses that prevailed in his diocese, and with so happy a combination of wisdom, firmness, and charity, that even his enemies were constrained to do homage to his virtues. Among his other remarkable acts, he removed his lay-chancellor, and took upon himself the ancient episcopal jurisdiction of hearing and deciding causes. The chancellor obtained a decree against him in chancery, with costs, but was so impressed with the superiority of the bishop's services to his own, that he dropped his claim, and even appointed a surrogate, with orders to pay implicit obedience to the authority of the bishop. The translation of the Old Testament into Irish was accomplished under B.'s direction (the New had been already translated), as well as some of the homilies of Chrysostom and Leo on the reading of the Scriptures. On the breaking out of the rebellion in 1641, his popularity for some time saved his family from violence, his being the only English house in the county of Cavan that was spared. At length, on his refusal to dismiss his flock, he was seized, and imprisoned in the castle of Cloughboughter. Thence he was removed to the house of a Protestant clergyman, where he continued to minister officially till his death, at the end of a few weeks, Feb. 7, 1642, in the 71st year of his age. The rebels followed his body to the grave in the churchyard of Kilmore. Besides some other works, B. translated the last two books of father Paul's history. His life was written by Burnet.

BEDESMAN, one who solicits or prays for something. The Anglo-Saxons called a prayer "bead," and in manuscripts of the 15th c. are the expressions before the name, "Your humble bedesman," or "bedeswoman."

BEDFORD, a co. in Pennsylvania on the Maryland border, drained by the Juniata, and reached by the Bedford division of the Pennsylvania railroad; 1000 sq.m.; pop. '80, 58,534. It has a mountainous surface, but is good for cattle raising. Coal mining is also carried on. Co. seat, Bedford.

BEDFORD, a co. in central Tennessee, on Dutch river, intersected by the Nashville and Chattanooga railroad; 550 sq.m.; pop. '70, 24,333—6484 colored. It has an undulating and fertile surface; produces corn, wheat, tobacco, cattle, etc. Co. seat, Shelbyville.

BEDFORD, a co. on the James river in s. Virginia, intersected by the Ohio, Mississippi and Atlantic railroad; 504 sq.m.; pop. '70, 25,327—10,770 colored; in '80, 31,226. The chief crops are cereals, tobacco, and wool. The peaks of Otter in this co. present magnificent scenery, and the Bedford alum springs are valuable. Co. seat, Liberty.

BEDFORD, a village and capital of B. co. in Penna., on the Huntington and Broad Top railroad, 94 m. w.s.w. of Harrisburg; pop. '70, 1247. The B. springs are a fashionable summer resort. There are iron and other manufactories in the village.

BEDFORD (Saxon, *Bedcanford*, town of the ford), the chief t. of Bedfordshire, is situated on the Ouse (which is navigable thence to the sea, a distance of 74 m.), about

63 m. n.n.w. of London by rail, and in the midst of a broad expanse of rich pasture, wheat, and barley lands. The town is clean and well paved, and the drainage has been recently greatly improved by the board of health. The charitable and educational institutions of B. are mostly due to sir W. Harpur, alderman of London, in 1561, who founded a free school, and endowed it with 13 acres of land. The enormous increase in the value of the property (from £150 to £14,000 or upwards a year) enables the trustees to maintain grammar, modern, and preparatory schools for boys, the same class of schools for girls, and 45 almshouses. Formerly, much of the charity was under the control of popularly elected trustees, but under the endowed schools act, the constitution has been changed. Now, the governing body consists of 27, instead of 52, members—6 *ex officio* (the mayor of B., the lord-lieutenant of the county, and the members of parliament for the town and county), 9 nominated, and 12 representative. The eleemosynary element—shown in the maintenance of almshouses, the giving of marriage-portions and apprentice-fees, etc.—used to be predominant in the distribution of the charity, but now the educational prevails, the funds being annually divided thus: One eleventh to the maintenance of the almshouses; two elevenths to elementary education; four elevenths to the grammar-school, and high-school for girls; and four elevenths to the modern schools. The only important manufacture of B. is that of iron goods, especially agricultural implements. Lace-making and straw-plaiting employ many poor women and children. A considerable traffic in malt, timber, coals, and iron is maintained with Lynn Regis, by means of the Ouse. B. is of great antiquity, and is mentioned in the Saxon chronicle under the name of Bedcanford, as the scene of a battle between the Britons and Saxons in 571. The Danes burnt it in 1010. Afterwards its old castle, said to be built by Edward the elder, is frequently mentioned in history. B. has returned two members to parliament since 1295. Pop. '71, 16,850. John Bunyan was born near Bedford. He dreamed his immortal dream in B. jail, and ministered to the Baptist congregation in Mill lane from 1671 to his death in 1688. The inhabitants still hold his memory in deep veneration, and some relics of him are preserved. A handsome new building, Italian in style, for the Bunyan schools, was completed in 1867. A bronze statue of Bunyan was erected by the duke of Bedford in 1874.

BEDFORD, DUKE OF. There have been two distinct dukedoms of B. That to be noticed here existed in the person of John Plantagenet, regent of France, and third son of Henry IV. of England, who was born about 1389. During his father's lifetime, he was governor of Berwick-upon-Tweed, and warden of the Scottish marches. In 1414, the second year of his brother's reign, he was created duke of B.; and he was made commander-in-chief of the forces in England while Henry V. was carrying on the war in France. After the death of Henry V. (1422), B., in accordance with the dying wish of the king, left the affairs of England in the hands of his brother Gloucester, and went to France to look after the interests of the infant prince, his nephew. The regency of France, in compliance with a request of his deceased brother, he offered to the duke of Burgundy, who refused it; he then assumed it himself, but not without consulting Burgundy as to the best method of carrying out the treaty of Troyes, by which Charles VI. declared Henry V. next heir to the French crown. On the death of Charles VI., a few months after Henry V., B. had his nephew proclaimed king of France and England, as Henry VI. In the wars with the dauphin which followed, B. displayed great generalship, and defeated the French in several battles—most disastrously at Verneuil, in 1424. But, in consequence of the rather parsimonious way in which men and money were doled out to him from England, and the withdrawal of the forces of the duke of Burgundy, he was unable to take full advantage of his victories. The appearance of Joan of Arc, notwithstanding the utmost energy of B., was followed by disaster to the English arms; and in 1435, B. was mortified by the treaty of peace negotiated at Rouen between Charles VII. and the duke of Burgundy, which effectually ruined English interests in France. The death of the regent, which took place Sept. 19, 1435, 14 days before the ratification of the treaty, was mainly, if not altogether, occasioned by his anxiety and vexation on account of the union thus formed. B., who was a patron of letters, purchased and removed to London the royal library of Paris, consisting of 900 volumes. For the present family of B., see RUSSELL, HOUSE OF.

BEDFORD, GUNNING S., 1806–70; b. Baltimore; a graduate at St. Mary's college, Md.; was professor in Charleston, S. C., in Albany medical college, and of midwifery in the New York university. Among his works are treatises on obstetrics, *Lectures on Diseases of Women*, etc.

BEDFORD LEVEL, an extensive tract of flat land on the e. coast of England, embracing nearly all the marshy district called the Fens. It extends inland around the Wash into the 6 counties of Northampton, Huntingdon, Cambridge, Lincoln, Norfolk, and Suffolk, and has an area of about 450,000 acres. Its inland boundary forms a horseshoe of high lands, and reaches the towns of Brandon, Milton—3 m. n.n.e. of Cambridge—Earith, Peterborough, and Bolingbroke. It is divided into three parts—the n. level, between the rivers Welland and Nene; the middle, between the Nene and the old Bedford river; and the s., extending to Stoke, Feltwell, and Mildenhall. It is intersected by many artificial channels, as well as by the lower parts of the rivers Nene, Cam, Ouse (Great and Little), Welland, Glen, Lark, and Stoke. It receives the waters of the whole

or parts of 9 counties. This district seems to have been a great forest at the time of the Romans, who cut the forest down; formed great embankments, to exclude the tide; and rendered the tract for a time a fertile inhabited region. The emperor Severus, in the 3d c., made roads through it, one of which is now covered with 2 to 5 ft. of water. In the 13th c., violent incursions of the sea stopped the outflow of the rivers; and it became a morass. The practicability of draining this extensive region seems to have been thought of as early as 1436, and many partial attempts were made after this. The first effectual effort was in 1634, when Francis, earl of Bedford, after whom the district was thenceforth called, obtained, along with 13 others, a charter to drain the level, on condition of receiving 95,000 acres of the reclaimed land. The work was partially accomplished in 3 years, at the expense of £100,000; but was pronounced by the government to be inadequate. Charles I. tried to get the work, with a greatly increased premium, into his own hands; but the civil war stopped further progress. In 1649, parliament confirmed William, earl of Bedford, in the rights granted to his father; and after a fresh outlay of £300,000, the contract was fulfilled. In 1688, a corporation was formed for the management of the level. The middle level has always been the most difficult to manage. St. Germain's sluice, at the confluence of the great drain in this district with the Ouse, was considered perfectly secure. But in May, 1862, this sluice gave way under the pressure of a strong tide, and the western bank of the middle level drain burst, speedily flooding about 6000 acres of fertile land. This led to the construction of a permanent coffer-dam of pile work, to shut off the tidal waters; and for the drainage of the middle level, Slater's-Lode sluice, the old outlet to the Ouse, was taken advantage of; and siphon pipes were laid over the coffer-dam, the flood-waters let off by them and by drains; the siphons acting as a permanent sluice.

BEDFORDSHIRE, a midland co. of England, bounded n.e. by Huntingdon; e. by Cambridge; s.e. and s. by Hertford; s.w. and w. by Buckingham; and n.w. by Northampton. It stands 37th of the 40 English counties in size, and 37th also in population. Extreme length, 31 m.; breadth, 25. Area, 463 sq.m., five sixths being arable, meadow, and pasture lands. The general surface is level, with gentle undulations. In the s., a range of chalk-hills, branching from the Chilterns, crosses B. in a n.e. direction from Dunstable, and another parallel range runs from Ampthill to near the junction of the Ivel with the Ouse. Between the latter ridge and the n.w. part of the county, where the land is also somewhat hilly, lies the corn vale of Bedford. No hill in B. much exceeds 900 ft. in height. The chief rivers are the Ouse (running through the center of the county, 17 m. in a direct line, but 45 by its windings), navigable to Bedford; and its tributary, the Ivel, navigable to Shefford. By these rivers, B. communicates with the counties of Cambridge, Huntingdon, and Norfolk. The s. and s.e. parts of the county consist of chalk, and the n. and n.w. of oolitic strata. Freestone is quarried, as well as chalk or clunch, to be burnt for lime. The soil varies greatly. In the s. of the county, it is chalk thinly covered with earth, and fit only for sheep-walks; but three fourths of the county is clay, which is very stiff between the Ivel and Ouse. A rich gravelly loam exists along the rivers. In the vale of Bedford, the soil is chiefly rich clay and deep loam; and to the n. the clay is stiff, poor, and wet. There are extensive market-gardens, especially on the rich deep loams. The chief crops are wheat, beans, and barley. The total acreage of B. under all kinds of crops, bare fallow, and grass, for the year 1876, was 256,567; of wheat, 46,767; barley or bere, 34,164; oats, 11,611; rye, 466; beans, 16,036; peas, 6376; total under corn crops, 115,426. B. is the most exclusively agricultural county in England. The principal proprietors are the duke of Bedford, the marquises of Tavistock and Bute, earl de Grey, lords Holland, Carteret, and St. John. Lace-making and straw-plaiting—for which Dunstable is celebrated—are the only branches of industry practiced to any extent, and they are carried on almost entirely by women. B. is divided into 9 hundreds, and contains 10 market-towns, 124 parishes, and 6 poor-law unions. Pop. '71, 146,257. Two members of parliament are returned for the county of B., and two for the town of Bedford. Many British and Roman antiquities exist in B., as well as the ruins of several monasteries, and some fine relics of Anglo-Saxon, early English, and Norman architecture among the parish churches. Three Roman ways once crossed the county, and several earthwork camps still remain.

BEDLAM, a popular corruption of Bethlehem, the name of a hospital for lunatics, in St. George's Fields, London. It was originally founded in Bishopsgate street Without, in 1246, by Simon Fitz-Mary, one of the sheriffs of London, as "a privy of canons with brethren and sisters." When the religious houses were suppressed by Henry VIII., the one in Bishopsgate street fell into the possession of the corporation of London, who converted it into an asylum for 50 or 60 insane persons. In the year 1675, the hospital was taken down, and a new one, affording accommodation for about 150 patients, was erected in Moorfields, at a cost of about £17,000. In 1814, the hospital was again pulled down, and the patients transferred to a new hospital in St. George's fields, erected for 198 patients; but in 1838 extended so as to accommodate 166 more. The building, with its grounds, now covers an area of 14 acres, and is lacking in nothing likely to insure the comfort or promote the recovery of patients. In former times, the management of B. was deplorable. The patients were exhibited to the public, like wild

beasts in cages, at so much per head, and were treated and made sport of by visitors, as if they had been animals in a menagerie. The funds of the hospital not being sufficient to meet the expenditure, partially convalescent patients, with badges affixed to their arms, and known as Tom-o'-Bedlams, or "Bedlam beggars," were turned out to wander and beg in the streets. Edgar, in Shakespeare's *Lear*, assumes the character of one of these. This practice, however, appears to have been stopped before 1675; an advertisement in the *London Gazette* of that date, from the governors of B., cautions the public against giving alms to vagrants representing themselves as from the hospital, no permission to beg being at that time given to patients. Now, the moral and physical management of the patients is so excellent, that annually more than one half of their number are returned as cured.

BEDLINGTON TERRIER, a dog so called from a village and parish of that name in Northumberland, one of the districts in which the race has been extensively bred. The chief points of a model B. T. are the following: Muzzle, rather long and fine, but powerful; head, high and rather narrow, the hair on the top being more silky and of a lighter color than on the rest of the body; eyes, small, round, and rather sunk; ears, filbert-shaped, hanging close to the head, slightly feathered at the tips; neck, long, slender, but muscular; body, well proportioned, slender, and deep chested; toes, well arched; legs, straight and rather long; tail, tapering to a point, with no feather; coat, somewhat fine but not silky, short and rather thin; color, liver or sandy, with dark flesh-colored nose, or blue-black, with black nose; height, 13 to 15 inches. The B. T. is greatly valued on account of its unsurpassed courage, its speed, and its sagacity. It is determinedly hostile to all kinds of vermin, and will face even the otter, fox, or badger without flinching. It is also a capital water-dog. The n. of England is the district *par excellence* of the true B. T., the dogs reared by breeders at or in the neighborhood of Newcastle usually receiving the awards of merit at dog-shows. The origin of the B. T. is not very certainly known, but it seems proved that the breed existed in Rothbury (also in Northumberland, to the n. of Bedlington) before it was known in the district whence it takes its name.

BEDLOE'S ISLAND, in the bay of New York (named after an early owner); ceded to the federal government for the purpose of harbor defense, and now occupied by fort Wood. It is a mile and a half w. of the Battery, or s. point of the city.

BEDMAR, Alfonso de Cueva, Marquis de, was b. in 1572. He has won an enduring notoriety on account of his daring and unscrupulous plot for the destruction of Venice, to which city he had been appointed ambassador from the court of Spain in 1607. It was a difficult office to fill, for Venice and Spain cherished most unfriendly feelings towards each other. Bedmar probably conceived that he was acting a patriotic and justifiable part, in taking advantage of his position to play the spy and conspirator; but whether or not, his scheme was contrived with admirable ingenuity. He first leagued himself secretly with the duke of Ossuna, viceroy of Naples, and Don Pedro of Toledo, governor of Milan, whom he made his confidants and coadjutors. He then purchased the services of a large number of foreign mercenaries, and scattered them through the city, to prevent suspicion. Ossuna furnished him with a band of semi-pirates, who were to enter the Venetian fleet, corrupt the sailors, and hinder operations in any way they could. The conspirators were to set fire to the arsenal of the republic, and seize all the important posts. At this precise moment, the Milanese troops were to appear at the extremity of the mainland, and those sailors who had been seduced from their allegiance were to convey them rapidly over to Venice. A Spanish fleet was to creep up the Adriatic, in order to assist if necessary. The city was then to be plundered and destroyed. The day chosen was that on which the doge wedded the Adriatic, when all Venice was intent on beholding the august ceremony. Fortunately, the night before the crime was to have been perpetrated, one of the conspirators betrayed the whole. Several persons were executed; but curiously enough, Bedmar, the arch-delinquent, was only dismissed. This has excited the skepticism of many writers as to the truth of the accusation; but the evidence in favor of the historic reality of the plot is generally held to be incontestable. The event forms the subject of Otway's popular and pathetic play, *Venice Preserved*. Bedmar now went to Flanders, where he became president of the council, and, in 1622, was made a cardinal by the pope. He then went to Rome, and finally returned to Spain as bishop of Oviedo, where he died in 1655. He is said to have been the author of a pamphlet published in 1612, directed against the liberties of Venice. It is entitled *Squittino della Liberta Veneta*.

BEDNORE', or Nuggur, a decayed city of Mysore, India, situated in the midst of a basin in a rugged tableland of the western Ghauts, at an elevation of more than 4000 ft. above the sea, in n. lat. 13° 50', e. long. 75° 6', 150 m. n.w. from Seringapatam. It was at one time the seat of government of a rajah, and its pop. exceeded 100,000. In 1763, it was taken by Hyder Ali, who pillaged it of property to the estimated value of £12,000,000, and subsequently made it the seat of his own government, calling it Hydernuggur (Hyder's town), of which the name Nuggur is an abridgment. It was taken by the British under gen. Matthews in 1783, but soon retaken by Tippoo, at the head of a vastly superior force, when gen. Matthews and all the principal British officers were put to death. The neighboring country is mostly covered with dense and luxuriant forests.

BED OF JUSTICE (Fr. *lit de justice*), literally, the seat or throne occupied by the French monarch when he was present at the deliberations of parliament. Historically, a B. of J. signified a solemn session, in which the king was present, to overrule the decisions of parliament, and to enforce the acceptance of edicts or ordinances which it had previously rejected. The theory of the old French constitution was, that the authority of parliament was derived solely from the crown: consequently, when the king, the source of authority, was present, that which was delegated ceased. Acknowledging such a principle, the parliament was logically incapable of resisting any demand that the king in a B. of J. might make, and decrees promulgated during a sitting of this kind were held to be of more authority than ordinary decisions of parliament. Monarchs were not slow to take advantage of this power to overawe any parliament that exhibited signs of independence. The last B. of J. was held by Louis XVI. at Versailles in Sept., 1787.

BEDOS DE CELLES, Don JEAN FRANÇOIS, a Benedictine monk of the congregation of St. Maur, and the most learned and practical master of the art of organ building in the 18th c., whose work on the art is to the present day of the greatest importance. He was born about 1714 at Chaux, and entered his order in 1726 at Toulouse, where he built several large and superior church-organs. He was elected a member of the academy of sciences in 1758; in 1770, he completed for the academy his great work, *L'Art du Facteur d'Orgues*, in 4 vols., large folio, with 137 copper plates, beautifully executed. This work has never been translated into English, but the greater part of it has been translated into German, B. de C. died in 1797.

BEDOUINS (Ar. *Bedawi*, plur. *Beduân*, "dwellers in the desert") are Arabs who lead a nomadic life, and are generally regarded, according to tradition, as the descendants of Ishmael, and the aborigines of Arabia. The most ancient notices found in Scripture agree, in their descriptions of the manners and customs of the B., with the facts of the present time. As nomads, the Bedouin Arabs have no united history, but only a collection of genealogies. They have but seldom appeared as a united people, taking a prominent part in the world's politics, and have never been entirely held in subjection by any foreign power. The desert of Arabia, especially the plateau of Nedjid, is their central place of abode; but, even in ancient times, they had spread themselves over the deserts of Egypt and Syria; and, in later times, after the decay of ancient civilization, they entered Syria, Mesopotamia, and Chaldea. The conquest of northern Africa, in the 7th c., opened up to them still vaster tracts, and they soon extended themselves over the Great Desert to the shores of the Atlantic ocean. At present, they are to be found scattered over an immense breadth of territory—viz., from the western boundary of Persia to the Atlantic, and from the mountains of Kurdistan to the negro countries of Sudan. In the cultivated lands of Mesopotamia, Chaldea, the Syrian confines, Barbary, Nubia, and the n. of Sudan, the Arabs are found intermingled with other nations; but in the deserts they have maintained their distinct character and independence. The characteristics of the B., as herdsmen and robbers in the desert, are intimately connected with the nature of their habitation. Their abstinent, precarious, and often solitary mode of life, makes them disposed to exercise mutual hospitality; but their independence, love of liberty, and other good qualities, are associated with violent passions and an infamous love of plunder, which is utterly reckless of the rights of property. They are generally well-made men, lean, sinewy, and active; but, on account of frequent hardships and privations, are commonly below middle stature. Their senses, especially sight, are keen, and their carriage is free and independent. The nose is commonly aquiline, the face rather lengthened, and the eyes are well shaped and expressive of both daring and cunning. In complexion, they have various shades of brown. With the exception of certain tribes in Syria, all the B. are professedly Mohammedans, but by no means strict in the observance of their religious rites and duties. Their *marabouts* (q.v.) —a class of ascetics—take the place of priests, and exercise considerable influence in all social and public affairs. As the Arabs have no settled government or policy, religious traditions and customs form the only bond of order and union among them. Though their intellectual powers are naturally good, they are miserably destitute of solid knowledge. Their endless tales and poetical effusions show a wonderful activity of imagination and an oriental love of hyperbole. The relation of the sexes to each other is less constrained than among the settled peoples of the east, and a substitute for polygamy is found in a frequent interchange of wives. Their favorite pastimes are the chase, ball-play, dancing, songs, stories, and the *dolce far niente* (pleasant laziness) of drinking coffee and smoking narghiles. Their diet is principally derived from their herds, but includes a few vegetables and even locusts and lizards. Honey is also a principal luxury with all classes, and, moreover, one which has a religious sanction, for is was indulged in by Mohammed himself, who makes copious mention of it in the Koran. They manufacture their own woolen clothing, which consists of the *haikh*—a long, wide garment fastened on the head and descending to the feet—and the *burnoose*, a large mantle. Only superior men wear breeches and linen or cotton shirts. The hair of the head is shaven, but the beard is a favorite object of cultivation. The political condition of the B. may be styled patriarchal. One or more families, the males of which bear the title of *sheik*, form the core of a tribe, and, along with the marabouts, or priests, constitute a kind of aristocracy. Out of their number, the superior *sheik*, or

kaid, is elected, who rules in patriarchal style over the whole tribe. This general sketch of the B. applies chiefly to the true nomads, or "dwellers in the desert," and is subject to several modifications with regard to tribes located in Barbary, Syria, and Mesopotamia, who practice agriculture, and dwell in houses.

BED-SORES are often a very troublesome complication of disease, to which a patient is liable when for a long time confined to bed, and is either unable or is not allowed to change his position. Thus they are liable to occur in cases of continued fever, or any other prolonged debilitating disorder, in paralysis from injury of the spinal cord, and in cases of fracture of the thigh. The skin, at certain projecting bony parts, chiefly about the region of the buttocks, or on the heel, is apt to inflame, ulcerate, and slough, especially if the patient is not kept perfectly clean—as, for example, when the evacuations and urine escape involuntarily. The patient sometimes complains of a sense of discomfort at the parts, as if he were lying on dry crumbs of bread; at other times, he seems to feel nothing. Hence, in all cases of prolonged supine position, the parts naturally pressed upon by the weight of the body should be carefully examined every day or two, as prevention is far easier than cure. When a long confinement to bed is expected, attempts should be made to thicken the cuticle, and enable it to bear pressure better, by rubbing the skin with a stimulant such as spirits or eau-de-Cologne. If the part, when first seen, looks red and rough, further damage is often prevented by covering it with a piece of calico, on which soap-plaster has been spread; the local pressure may be removed by air-cushions specially constructed for cases of this kind, and in many instances, Arnott's water-bed (q.v.) affords great comfort. If the case is one in which it is admissible, the patient should be made to alter his position frequently. When there are excoriations, and a threatening of sloughing, a poultice composed of equal parts of bread-crumbs and of finely-grated mutton suet, mixed over the fire in a saucepan, with a little boiling water, is often a comforting and useful application. After sloughing has fairly begun, stimulating applications, such as resin ointment, must be applied. It is worthy of notice that bed-sores come on earlier in cases of fractured spine than in any other: they generally appear by the fourth day, and have been seen two days after the accident. They commonly form one of the most powerful agents in destroying life in cases of this accident, diseases of the urinary organs being the other.

BEDSTRAW, *Galium*, a genus of plants belonging to the natural order *rubiaceæ* (q.v.), and distinguished by a small wheel-shaped calyx, and a dry two-lobed fruit, each lobe containing a single seed. The leaves, as in the rest of the order, are whorled, and the flowers minute; but in many of the species the panicles are so large and many-flowered that they are amongst the ornaments of the banks and other situations in which they grow. The species are very numerous, natives chiefly of the colder parts of the northern hemisphere, or of mountainous regions within or near the tropics. About 16 species are found in Britain, some of them very common weeds. Amongst these is the YELLOW B. (*G. verum*)—sometimes called CHEESE RENNET, because it has the property of curdling milk, and is used for that purpose—a small plant with linear deflexed leaves and dense panicles of bright yellow flowers, very abundant on dry banks. The flowering tops, boiled in alum, afford a dye of a bright yellow color, much used in Iceland; and the Highlanders of Scotland have long been accustomed to employ the roots, and especially the bark of them, for dying yarn red. They are said to yield a red color fully equal to that of madder, and the cultivation of the plant has been attempted in England. The roots of other species of the same genus possess similar properties, as those of *G. tinctorium*, a species abundant in low marshy grounds in Canada; and those of *G. septentrionale*, another North American species, used by some of the Indian tribes. Like madder, they possess the property of imparting a red color to the bones and milk of animals which feed upon them. Medicinal virtues have been ascribed to some of the species, as *G. rigidum* and *G. Mollugo*, which have been extolled as useful in epilepsy.—The roasted seeds of some, as *G. aparine*, the troublesome *goosegrass*, or *cleavers*, of our hedges —remarkable for the hooked prickles of its stem, leaves, and fruit—have been recommended as a substitute for coffee; but it does not appear that they contain any principle analogous to caffeine. This plant is a native of the northern parts equally of Europe, Asia, and America. Its expressed juice is in some countries a popular remedy for cutaneous disorders.—The roots of *G. tuberosum* are farinaceous, and it is cultivated in China for food.—The name B. is supposed to be derived from the ancient employment of some of the species, the herbage of which is soft and fine, for strewing beds.

BEDWIN, GREAT, a t. of Wiltshire, on the Kennet and Avon canal and the Great Western railway, 69 m. w. by s. of London. Pop. '71, 2068. A fierce, indecisive battle occurred here in 674, between the kings of Mercia and Wessex. St. Mary's church was built in the beginning of the 14th c., and is constructed of flint, except the piers, arches, and dressings, which are of freestone. Jane Seymour, one of the queens of Henry VIII., and Dr. Willis, an eminent physician of the 17th c., were born here. In the end of last century, the remains of a Roman villa were discovered, including tesseræ, bricks, a tesselated pavement, a huge leaden cistern, and the foundations of baths.

BEDWORTH, a t. in Warwickshire, 5 m. n. of Coventry, and 96 m. n.w. of London. Ribbons and trimmings are made in the town to some extent, and silk-mills, malt-kilns, lime-kilns, brick-fields, and collieries in the neighborhood furnish employment to

large number of the inhabitants. B. is a station on the Coventry and Nuneaton railway. The pop. in 1871 was 3405, a decrease from that of 1861, which amounted to 3968.

BEE, the common name of a very large family of insects, of the order *hymenoptera* (q.v.), belonging to the section of that order called *aculeata*, in which the females are furnished not with an ovipositor, but (usually) with a sting. Bees were all included by Linnæus in the genus *apis* (Lat. for B.), but are now divided into many genera; and the name *anthophila* (Gr. flower-loving) or *mellifera* (Lat. honey-bearing) is given to the family which they constitute. All bees in a perfect state feed exclusively or chiefly on saccharine juices, particularly the nectar or honey of flowers; and the ordinary food of their young, in the larva state, is the pollen of flowers, or a paste, often called bee-bread, composed of pollen and honey. They evidently perform a very important part in the economy of nature, in the fertilization of flowers, which depends upon the contact of particles of the pollen with the stigma; and, as if to secure this object more perfectly, in their search for honey and pollen, they usually—some have perhaps too hastily said always—pass from flower to flower of the same kind, and not to flowers of different kinds indiscriminately. They abound in almost all parts of the world, but particularly in the warmer parts of it. Not fewer than 250 species are known as natives of Britain.

To enable them to reach their liquid food at the bottom of the tubes of flowers, and in the little receptacles in which it is produced, bees have certain parts of the mouth—the *maxillæ* and *labium* (see INSECTS), or lower jaws and lower lip, with their feelers (*palpi*)—elongated into a sort of proboscis; and the *ligula* is elongated, sometimes, as in the common hive B., assuming the form of a filament, is capable of extension and retraction, and is folded up when not in use. This is the organ sometimes called the tongue of bees, although the name cannot be regarded as very appropriate, it being a part of the labium or lower lip. The other elongated parts of the mouth serve as a sort of sheath for this organ, when it is folded up. It is not tubular, and employed in the manner of suction, as was at one time supposed, but is generally more or less hairy, so that the honey adheres to it as it is rolled and moved about, and is conveyed up through the mouth into the honey-bag, sometimes called the first stomach, an appropriate receptacle, in which it apparently undergoes some change—without, however, being subjected to any process analogous to digestion, and is ready to be given forth again by the mouth, according to the habits of those species of bees which are social, as food for the members of the community that remain at home in the nest, or to be stored up in cells for future provision. See HONEY. But the mouth of bees is also adapted for cutting and tearing, and to this purpose their mandibles or upper jaws are especially appropriated. Of these, some of them, as the common humble B. (q.v.), make use to open their way into the tubes of flowers which are so deep and narrow that they cannot otherwise reach the nectar at the bottom. Others make use of their mandibles to cut out portions of leaves, or of the petals of flowers, to form or line their nests; the common hive B. uses them in working with wax, in feeding larvæ with pollen, in cleaning out cells, in tearing to pieces old combs, in combats, and in all the great variety of purposes for which organs of prehension are required. But it is not by means of any of the organs connected with the mouth that bees collect and carry to their nests the supplies of pollen needful for their young. The feathered hairs with which their bodies are partially clothed, and particularly those with which their legs are furnished, serve for the purpose of collecting the pollen, which adheres to them, and it is brushed into a hollow on the outer surface of the first joint of the tarsus of each of the hinder pair of legs, this joint being therefore very large, compressed, and of a square or triangular form—a conformation to which nothing similar is found in any other family of insects. It is also worthy of observation, that in the social species of bees, the males and the queens, which are never to be employed in collecting pollen, do not exhibit this conformation adapted to it, but only the sexually imperfect females, commonly called neuters or workers.

Bees, like other hymenopterous insects, are extremely well provided with organs of sight, and evidently possess that sense in very great perfection. In the front of the head, they have two large eyes, the surface of each consisting of many hexagonal plates, which perhaps may not unaptly be likened to the object-glasses of so many telescopes; and the faculty which these insects certainly possess, of returning in a direct line to their hive or nest, from the utmost distance of their wanderings, has been with greatest probability ascribed to their power of sight. But besides these large eyes, they have, like the rest of the hymenopterous order, three small eyes on the very top of the head, which are supposed to be intended to give a defensive vision upwards from the cups of flowers.—They are evidently, however, possessed of organs which enable them to guide their movements in the dark as accurately as in the full light of day, at least within the nest or hive; and this power is generally ascribed to the *antennæ* (q.v.), which are sometimes supposed to be not merely delicate organs of touch, but also organs of hearing, or of some special sense unknown to us. It is certain that the social bees have some means of communicating with each other by means of their antennæ; and that they avail themselves of these organs both for their ordinary operations, for recognition of each other, and for what may be called the conduct of the affairs of the hive. There can be no doubt that bees possess in a very high degree the sense of smell; and their possession

of the senses of taste and hearing is almost equally unquestionable, whatever difficulty there may be in determining the particular organs of the latter sense.—The wings of bees, like those of other hymenepterous insects, are four in number; thin and membranaceous; the hinder pair always smaller than the others; and in flight, attached to them by a number of small hooks, so that the four wings move as if they were two.

The sting of bees is a very remarkable organ. It consists of two long darts, with a protecting sheath. A venom bag is connected with it, and powerful muscles for its propulsion. The wound appears to be first made by the sheath, along which the poison passes by a groove; and the darts thrust out afterwards in succession, deepen the wound. The darts are each furnished with a number of barbs, which render it so difficult to withdraw them quickly, that bees often lose their lives by the injury which they sustain in the effort.—The males are destitute of sting.

The great family of bees is divided into two principal sections called *anārenetæ* and *apiariæ*, or *andrenidæ* and *apidæ;* the latter names, however, being sometimes employed in senses more restricted. In the first of these sections, the *ligula* is comparatively short and broad; in the second, it is lengthened, and has the form of a filament. All the *andrenetæ* live solitarily, as well as several subdivisions of the *apiariæ*. These solitary bees do not lay up stores for their own winter subsistence; but they display very wonderful and various instincts in the habitations which they construct and the provision which they make for their young. There are among them males and perfect females only, and no neuters. The work of preparing nests and providing food for the young seems, in all of the species, to be performed exclusively by the females. *Colletes succincta*, a common British species of the *andrenetæ*, affords an example of a mode of nest-making, which, with various modifications, is common to many species of that section. The parent B. excavates a cylindrical hole in the earth, usually horizontal, to the depth of about two inches, in a dry bank or a wall of stones and earth. The sides of this hole are compacted by means of a sort of gelatinous liquid, secreted by the insect, and it is occupied with cells, formed of a transparent and delicate membrane, the substance of which is the same secretion in a dried state. The cells are thimble-shaped, fitting into each other, a little space being left at the furthest end of each for the reception of an egg and a little paste of pollen and honey. The last cell being completed, and its proper contents deposited in it, the mouth of the whole is carefully stopped up with earth.—Some of the solitary bees, possessing great strength of mandibles, excavate their nests in old wood. *Xylocopa violacea*, one of the *apiariæ*, not uncommon in some parts of Europe, makes a tunnel not less than 12 or 15 in. long, and half an inch wide, which is divided into 10 or 12 cells; an egg with store of pollen and honey is deposited in each compartment, and as the lowest egg is hatched first, a second orifice is provided at that part of the tunnel, through which each of the young ones in succession comes forth to the light of day, each larva, as it is about to change into the pupa state, placing itself with its head downwards in the cell.—Numerous species of solitary bees excavate their tunnel-shaped nests in the soft pith of decayed briers or brambles, of the particles of which they also form their cells.—Some species of *megachile osmia*, etc., line them and divide them into cells with portions of leaves or of the petals of flowers. See LEAF-CUTTER BEE. Some of the solitary bees make their nests, not in the earth, but in cavities of decaying trees, or other such situations, where they construct their cells without the same necessity of excavation; but some of them, by a very admirable instinct, surround their nest with down collected from the leaves of plants, an excellent non-conductor of heat, so that a nearly uniform temperature is maintained in situations in which the changes would otherwise be great and rapid. Some bees make their little nests in old oak-galls, and there are species which appropriate empty snail shells to that use.—Some species of the genus *megachile* build their nests of a sort of mason-work of grains of sand glued together with their viscid saliva. The nest of *M. muraria*, thus constructed, is so hard as not to be easily penetrated by a knife, and very much resembles a splash of mud upon a wall.

The social bees live in communities like those of ants, which also, like theirs, consist of males, females, and neuters—these last being females with ovaries imperfectly developed, and characterized by peculiarities of form and structure, as well as of instinct and employments, remarkably different from those of the perfect females. The social bees are conveniently divided into humble bees (q.v.) and honey bees, of the latter of which the common hive B. (see the next section of this article) may be regarded as the type. Before proceeding to a more particular account of the hive B., it may be proper to remark that the species of honey B. (the restricted genus *apis*) are not few, and that they are natives of the warm parts of the old world: the hive bees (*apis mellifica*) which now abound in some parts of America, and which have become naturalized in the forests to a considerable distance beyond the abodes of civilized men, being the progeny of those which were conveyed from Europe. The hive B. is said not to have been found to the w. of the Mississippi before 1797, but in fourteen years it had advanced 600 m. further in that direction. The different species of honey B. in a wild state generally make their nests in hollow trees, or among the branches of trees, sometimes under ledges or in clefts of rocks; and their stores of honey are not only sought after by man, but afford food to numerous animals, some of which equally delight to prey upon their larvæ. The B. was amongst the ancient Egyptians the hieroglyphical emblem of royalty.

The B. domesticated or cultivated in Egypt, is not, however, our common hive B., but another species called *apis fasciata;* and in Italy and Greece a species called *A. ligustica* is employed, which has been recently introduced into England, and is now domesticated at the B. house of the apiarian society, Muswell hill, near London. These species differ little from the common hive B., and their honey is very similar; but that of some species is considerably different. *A. unicolor*, of Madagascar and the Isle of France, yields an esteemed honey of a green color. It is domesticated, or is the object of human care and attention there, as are also *A. Indica* in some parts of India, and *A. adansonii* in Senegal. We regret that our limits do not permit us to give a particular account of any of these species.—The genus *melipona* is nearly allied to *apis*. The species are natives of South America, and their honey is extremely sweet and agreeable, but very liquid, and apt to ferment. They make their nests in the cavities or on the tops of trees.

The Hive Bee.—Natural History.—The instincts and social economy of the HIVE B. (*apis mellifica*) have been studied with great attention both in ancient and modern times, and discoveries—than which, perhaps, nature presents nothing more interesting and wonderful—have rewarded the patient observations of Huber and others who have devoted themselves to this subject. *Apiarian societies* have been formed for the purpose of prosecuting this single branch of natural history, and of promoting successful apiculture, or the economical keeping of bees.

The hive B. is probably not a native of Britain, and may even have been brought to Europe from the east. Its communities seem ordinarily to number from 10,000 to 60,000 individuals, and there appears no reason to think that the care bestowed upon the insect by man, or the *hives* which he has provided for it, have made any important difference in this respect. One member of each community is a perfect female—the queen or mother B.; from 600 to 2000 at certain seasons are males; and the remainder are *neuters* or workers, the real nature of which has been explained in the previous part of this article.

The workers have a body about half an inch in length, and about one sixth of an inch in greatest breadth, at the upper part of the abdomen. The antennæ are twelve-jointed, and terminate in a knob. The abdomen consists of six joints or rings, and under the scaly coverings of the four middle ones are situated the *wax-pockets* or organs for the secretion of wax. The extremity of the abdomen is provided with a string, which is straight. The basal joint of the hind tarsi is dilated to form a pollen-basket, and the legs are well provided with hairs for collecting the pollen and brushing it into this receptacle.—The males or *drones*, so called from the peculiar noise which they make in their flight, are much larger than the neuters, and thicker in proportion. The antennæ have an additional joint. The eyes are remarkably large, and meet upon the crown.—The perfect females are considerably longer than either the workers or males; they are also distinguished by the yellow tint of the under part of the body, and very remarkably differ from all the other inmates of the hive in the shortness of their wings, which, instead of reaching to the extremity of the abdomen, leave some of its rings uncovered. —Neither males nor queens have wax-pockets, nor have they pollen-baskets. Their legs also are less hairy. The sting of the queen B. is curved. The mandibles both of the males and perfect females are notched or toothed beneath the tip, which those of the workers are not.—It will be seen from this brief description that the sexes differ so widely as to appear, if the contrary were not well known, insects of different species; but still more remarkable is the difference between the females and the workers when we consider that it is all to be ascribed to the different forms of the cells in which the eggs are hatched and the young bees reared, and to the different kinds of food with which they are supplied. All doubt upon this point is removed by the interesting discovery of Schirach, that when a hive is deprived of its queen, the bees provide themselves with another, if there are eggs or very young larvæ in the cells appropriated to the breeding of workers; proceeding immediately to transform, for this purpose, one of these cells, and sacrificing, without scruple, the eggs or larvæ in the cells adjoining that selected for transformation and enlargement. These are facts well ascertained, but of which science has yet been unable to give any explanation.

The greater part of the life of the queen or mother B. is spent in laying eggs for the increase of the population of the hive; and this increase goes on at a rapid rate, as the queen not unfrequently lays 300 eggs in a day. The number, however, varies greatly. In cold weather it is very small, but the invariable presence of brood in different stages, in a well-stocked hive, proves that some eggs are laid even in winter. During the later spring months the number is very great; many practical apiarians considering that as many as 1000, or even 2000, are deposited daily. The community, however, is not destined to an indefinite increase; but in certain circumstances, *swarming* takes place, and new colonies are founded.

The impregnation of the queen takes place in the air, and usually within a few days after she herself has emerged from the cell. It is the only occasion of her ever leaving the hive, except that of swarming, and there is no repetition of it during her whole life. The question has therefore been asked, why there are so many males in a B. community; but no very satisfactory answer has been given to it. The males are not known to fulfill any other purpose than that of the propagation of their species; and after the swarming season is over, the greater part of them are ruthlessly massacred by the workers, as if in

dread of their consuming too much of the common store. The greater part of the workers themselves are supposed scarcely to live for a year; the duration of the life of queen bees is often more than three years.

The queen B., when about to begin to lay eggs, is the object of great attention on the part of the workers, and so continues. She moves about in the hive, attended by a sort of retinue of about 10 or 15 workers, by some of which she is frequently supplied with honey. But the name of queen B. appears to have originated in a mistaken notion that something analogous to a monarchy subsists in the bee-hive; and imagination being permitted very free scope, many things have been invested with a false coloring derived from this analogy. The queen or mother B. appears to be the object of particular regard, as indispensable to the objects for which the B. community subsists, and to which the instincts of all its members are variously directed. She moves about, depositing her eggs in the cells which the workers have prepared, and they are ready to take charge of each egg from the moment that it is deposited. Her employment requires that she should be fed with food collected by others, and many of the workers are in like manner supplied with food whilst busy within the hive, as well as the larvæ in the cells; but there is no evidence whatever of anything like authority exercised by the queen, or, indeed, of any superiority of one over another in the whole multitude.

The queen B. at first lays eggs which give birth to workers, and afterwards there takes place a laying of eggs which become drones. With unerring instinct, she places each egg in the kind of cell appropriate to it; whilst also, at the proper time, cells of the proper kind are prepared beforehand by the workers, the drones' cells being larger than the workers' cells. The cells in which future queens are to be reared are very unlike all the others, but the eggs differ in no respect from those deposited in workers' cells. It is a curious circumstance, that queens, of which the fecundation has been prevented till they are considerably older than usual, lay only drone eggs. It occasionally also happens that some of the worker bees lay eggs, and these invariably produce drones.

The eggs of bees are of a long shape and bluish-white color, about one twelfth of an inch in length. They are hatched in about three days. The larvæ are little worm-like creatures, having no feet, and lying coiled up like a ring: they are diligently fed by the working bees, until, in about five days, when large enough nearly to fill the cell, they refuse food, upon which the attendant bees seal up the cell with wax, and the larva, spinning itself a fine silken envelope or cocoon, is transformed into a pupa; and about the 18th day—or, in the case of drones, the 24th day—from the deposition of the egg, the young B., in its perfect state, breaks the covering, and issues from the cell. It is caressed and supplied with food by the attendant bees, and is believed not to try its wings until the following day. The cell from which a young B. has issued is speedily cleaned out, and prepared for the reception of another egg or of honey. The fine silken envelope of the pupa, however, remains attached to the cell, of which the capacity thus becomes gradually smaller, until the cells of old combs are too small to receive eggs, and can be used for honey alone, a fact of which the importance in relation to the economical management of bees is obvious.—The spinneret, by means of which the larva spins the cocoon, is a small organ connected with the mouth.—The food with which the larvæ are supplied is a mixture of pollen, honey, and water, with the addition, possibly, of some secretion from the stomachs of the working bees, in which it is prepared. It varies a little, according to the age and kind of the larva, and the peculiarities of that given to young queens appear to be indispensable to their fitness for their future functions. Pollen is constantly found stored up in the cells of the hive, and is often called bee-bread. Most people have met with such cells in honey-comb, and have observed the bitter and peculiar taste of the contents.

The combs of a bee-hive are parallel to each other, forming vertical strata of about an inch in thickness, and distant about half an inch from each other. The cells are therefore nearly horizontal, having a slight and somewhat variable dip towards the center of each comb. The central comb is generally first begun, and next after it those next to it on each side. Circumstances frequently cause some departure from this uniform and symmetrical plan, which, however, still remains obvious. Each comb consists of two sets of cells, one on each side; and it may be mentioned as an illustration of the wonderful industry of bees, and the results of their combined labors, that a piece of comb, 14 in. long by 7 in. wide, and containing about 4000 cells, has been frequently constructed in 24 hours. The greater part of the comb usually consists of the kind of cells fitted for breeding workers, a smaller part of it of the larger or drone cells. After the principal breeding-season is over, the cells of some parts of the comb are often elongated for the reception of honey; and sometimes comb of greater thickness, or with unusually long cells, is constructed for that purpose alone, in which case the mouths of the cells are inclined upwards, more than is usual with the ordinary brood-cells. When a cell has been completely filled with honey, its mouth is *sealed* or covered with wax.

It is impossible to look at a piece of comb taken from a bee-hive, without admiring, not only its beauty, but the perfect regularity of the size, form, and arrangement of the cells; and the more carefully that it is examined, the more must it be admired. For in it are practically solved, by an instinct which can only be referred to the infinite wisdom of the Creator, some problems difficult to human science, particularly in the combination of the greatest economy of materials and of space, with the most perfect convenience

and the greatest strength. It appears even at a glance, that the cells are hexagonal or six-sided, the hexagons perfectly regular, and in this way there are no interstices between the cells. Now, the mathematician knows that there are only three regular figures, that is, figures of which all the sides and angles are equal, bounded by straight lines, with which a space can be perfectly filled up in this way—the equilateral triangle, the square, and the hexagon; and of these the hexagon is at once the most suitable for the larva of the B. in its form, and the strongest in its nearest approach to the circle. The circular form itself would have left large interstices. But this is not all: the same wisdom which has given the solitary bees, already noticed, their instinct to surround their nest with a cottony substance, which serves as a non-conductor of heat, has directed the hive B. to the constant adoption of a mode of constructing its combs, which adds greatly to the strength they would have possessed with the same amount of materials, if the cells had been merely regular hexagonal prisms, and the partition in the middle of the comb, between the cells of the one side of it, and those of the other, therefore a simple plane. It is so far from being so, that when carefully examined, it appears, if the expression may be used, the most ingenious part of the whole structure. It is composed of a multitude of little rhombs, or four-sided figures, with equal and parallel sides, and two obtuse and two acute angles, the obtuse angles being invariably angles of 109° 28′, and the acute angles of 70° 32′, agreeing precisely with the results of mathematical analysis, applied to the difficult question of the form of the facets of a three-sided pyramid, which should terminate a six-sided prism, so as to combine the greatest economy of materials with the greatest strength. On looking at a piece of empty honey-comb, placed between the eye and the light, we readily perceive that the cells are not opposite to each other, cell to cell; but that the point of meeting of three sides of three cells, on one side, is opposite to the center of a cell on the other side—a circumstance which of itself we cannot but regard as calculated greatly to increase the strength of the whole fabric. It follows also from this, that the terminating pyramids of the cells on the one side do not interfere with the form of the cells on the other side, but the three rhombic facets, which terminate each cell, belong likewise to three distinct cells on the opposite side of the comb.

The only departure from perfect regularity in the form of the cells, is in the transition from the smaller or workers' cells to the larger or drones' cells, which, when it takes place, is managed with great simplicity and beauty of contrivance. Our limits, however, do not permit us to enter further into this subject.

The material of which the cells are built is chiefly wax (q.v., and see Bees-Wax), which is at first of a white color, but becomes brownish-yellow with age, and in very old combs, almost black. Although wax exists as a vegetable product, yet bees-wax is now known to be produced by a chemistry which is carried on in the bodies of bees; and it has been found that they produce wax and build combs when supplied only with honey or saccharine substances. The *wax-pockets* in the abdomen of working-bees have been already referred to. The bees which are about to proceed to wax-making, suspend themselves in clusters in the hive, attaching themselves to each other by means of hooks with which their feet are provided; and whilst they remain motionless in this position, the wax appears to be formed, in small scales, which they afterwards take in their mouths and curiously work up with a secretion from the mouth itself, passing the wax, in the form of a minute riband, through the mouth, first in one direction and then in the opposite one, and finally depositing it in its proper place for the foundation of the comb. One B. always begins the comb alone, the rest, in gradually increasing numbers, proceed in accordance with what has been already done. The bees which elaborate and deposit the wax, do not, however, construct the cells, which is done by others, partly at least by a process of excavation in the wax deposited. It is supposed by many naturalists, that some of the working-bees are exclusively wax-workers, some nurses, etc.; but others think that there is only one class of working-bees, all ready for any kind of work according to circumstances.

But wax, although the chief, is not the only material of the combs. *Propolis* (q.v.) is also employed in small bands to give greater strength to the cells, the mouths of which are surrounded with it, and made thicker than their walls. This substance, which is obtained by bees from the viscid buds of trees, is also employed for more firmly attaching the combs to the hive, for closing up apertures in the hive, for covering up obnoxious substances, intruding slugs, etc., which are too large to be removed, and for a variety of similar purposes.

It has been already stated that queen-bees are hatched and reared in cells different from the rest. They are, indeed, very different, being vertical and not horizontal in their position—not hexagonal, but rather oval in form—and much larger than the other cells, even in proportion to the size of the animal that is to inhabit them: they are generally placed on the edge of a comb, and when they have served their purpose, are partially removed, so that during winter they resemble acorn-cups in appearance.

Two queens cannot exist in the community together. There is implanted in them the most deadly rivalry; and the mother-bee, if permitted, would even tear open every queen cell of which the inmate has nearly approached maturity, and inflict death by her sting. One of those wonderful instincts, however, with which bees are endowed, counteracts this at those times when, upon account of the increased numbers of the

community, and in order to the formation of new colonies, it is requisite that it should be counteracted. The workers throng around the queen, hem her in, and prevent the execution of her purpose. The cell of the young queen is also carefully guarded, and she is not permitted to leave it. At such times peculiar sounds, produced probably by the action of the wings, are emitted both by the actual queen under restraint in her movements, and by the young one in the cell, which may be heard by an ear applied to the outside of the hive, and are familiar to B. cultivators as one of the surest signs of swarming. The queen now becomes restless; her agitation communicates itself to those around her, and extends through the hive; the ordinary work of the community is in great part neglected; fewer bees than usual are seen to leave or return to the hive; and at last the queen-bee rushes forth, preceded and followed by crowds which press and throng upon each other, form a buzzing cloud in the air, and very generally settle upon a bush in the neighborhood, where they soon congregate closely together, hanging by their claws in a dense cluster. Sometimes they rise up in the air, and fly off at once to a considerable distance, apparently to some previously selected place in the thick top of a tree—in the chimney or roof of a house, where they happen to find an aperture—or in some such situation. More frequently, they settle not far from the hive which they have left, often on some very humble plant, or even on the grass, and soon rise again. It is the care of the cultivator to prevent this by providing them immediately with a suitable habitation in a new hive, invitingly placed above them, or into which he puts the swarm after they have congregated closely together as above described. It sometimes happens that bees hurry out of their hive without their queen, in which case they do not in general congregate so closely together where they settle, and soon return to the hive again. Swarming generally takes place on a fine day; and when the bees seem on the very point of *coming off*, a cloud passing over the sun is enough to retard it. Bad weather occasionally not only retards but prevents it, the young queens being at last killed in their cells.—When the first swarm of the season has left the hive with the old queen, as is usually, if not always the case, the imprisoned young queen is set at liberty; and if the B. community is a large and prosperous one, other young queens also come forth from their cells, and leave the hive with successive swarms, the number of which depends upon the climate, the season, etc. In Britain, it is not uncommon for a bee-hive to send off three swarms in a summer, the first being almost always the largest, and not unfrequently itself sending off a swarm before the season is over.

Bees left without a queen, and with no means of supplying the want, appear to feel themselves cut off from the very purpose of their existence; the labors of the community are relinquished, and its members are dispersed and die. It has already, however, been stated, that bees left without a queen can provide themselves with one, by transforming and enlarging a worker's cell which contains an egg or very young larva. This process is sometimes carried on as if by several distinct parties, in different parts of the hive at once; and as if aware that time will be gained, the bees generally prefer cells containing larvæ of two or three days old to those containing eggs.

Bees become partially torpid during cold weather, consuming much less food than they would otherwise require. They are readily aroused from this state, however, as may at any time be proved by tapping on a bee-hive, when it will be found that the temperature of the interior of the hive rises rapidly. Respiration is considerably lessened in the state of partial torpidity, and the temperature rises when it is resumed. The respiration of bees takes place by air-tubes or *tracheæ* (see INSECTS), and is very active when the insect is in a state of activity. The respiratory movements are easily seen in looking at a bee. The consumption of oxygen by this process might be expected soon to reduce the atmosphere within a hive to a state in which it could no longer support animal life; but in summer, when respiration is active and the hive populous, a constant circulation of air is maintained by the insects themselves, some of which are employed in a rapid vibration of their wings for this purpose. A greater or smaller number of them, according to circumstances, may frequently be seen thus engaged in fanning the air at the mouth of a bee-hive.

It may well be deemed an extraordinary fact, that among the enemies of bees are to be reckoned certain species of moth, which, notwithstanding the danger of the stings of the bees, enter the hives and deposit their eggs. After the eggs are hatched, the larvæ feed upon the combs. Mice sometimes eat their way into the hives in winter, and destroy and plunder unmolested.

Bees are sometimes very destructive to each other in their combats, as when one B. community is assailed by others for the purpose of plunder. To this the weaker communities are liable, particularly when flowers are few, and bees are awakened to full activity in the warm days of early spring. The narrower that the entrances of bee-hives are at this season, at least of the less populous hives, the less likely is the B. owner to suffer loss from this cause, as the narrow entrance is more easily defended even against very numerous invaders.

Management of Bees.—We do not think it necessary to enter largely into the subject of *apiculture*—the cultivation or management of bees.

It is, of course, necessary that the *apiary* or stock of bee-hives should be situated in a neighborhood where flowers sufficiently abound for the supply of honey. It is, however, by no means certain to what distance bees roam. Some authors mention

one mile as the probable distance; but the opinion has apparently been hazarded on mere conjecture, and there seem to be good reasons for supposing that a much greater distance might more correctly be named. But whatever distance bees may be capable of traveling in quest of honey, it is undoubtedly of great importance that they should have good feeding-ground in the immediate neighborhood of the apiary; and in many parts of the world, the practice prevails of removing them from place to place, according to the season, in order that advantage may be taken of the greatest abundance of flowers. Thus in the s. of Scotland, bee-hives are very frequently removed to heath-covered tracts in the beginning of August, and remain there till the heath is out of flower; and this affords in many parts of the country the most plentiful honey-harvest, although in other parts, especially where white clover abounds, the greatest quantity of honey is obtained earlier in summer. The difference between *heather honey* and *flower honey* is well known in Edinburgh. No small number of bee-hives from that city and its immediate vicinity are annually conveyed for a few weeks to the Pentland hills. The conveyance of bees "to the heather" is generally accomplished either by a handbarrow or a spring-cart of easy motion, so that the combs may not be displaced by shaking; and the mouth of the hive is carefully closed with a plate of perforated zinc, or other contrivance for keeping in the bees and permitting circulation of air. Fifty or one hundred bee-hives may often be seen collected in one place, and under the care of one person, during the heather season.—In Egypt, far greater numbers of hives (of *apis fasciata*), are often kept in a single vessel on the Nile, and are conveyed from place to place on the river, according to the succession of flowers in the different districts. A somewhat similar practice prevails on the Rhone; and the transporting of bees (*apis ligustica*) from pasture to pasture has been usual in Greece, in Asia Minor, and in Persia, from remote antiquity.

As to the form of bee-hives, and the material of which they should be made, there are great differences both of opinion and practice. Glass hives, and hives with glass windows, which can be covered at pleasure with wooden slides, are employed by those who wish to observe the movements and habits of bees; but for profitable purposes, wood and straw are in Britain the only materials in common use. For the material of a hive, wood has the advantage over straw in its greater neatness and durability; but there is a disadvantage in the greater likelihood that, unless shaded from the sun, portions of the comb may be so much melted as to fall in hot weather. In some parts of Europe, cylindrical cork-hives are much used, made by removing the wood of a portion of the cork-tree, and leaving the bark uninjured; and hives of earthenware are common in Greece and Turkey. The form of hives is of little consequence; but it is important that the owner should have facilities for giving increased room both above and below the stock-hive: increased room above is required for the reception of pure honey-comb unmixed with brood, and the capability of adding to the hive below, by raising it up an additional story, is often requisite to prevent swarming, which is incompatible with the collection of a large store of surplus honey.

Bees require attention at the time of swarming, that they may not fly away and be lost. They require also to be fed during winter, when, on account of a bad season, the lateness of the swarm, or other cause, they have not enough of honey to support them. A common rule is, that the weight of the contents of the hive must be at least 20 lbs., that the bees may survive the winter without being fed; and even in this case a supply of food for a short time in spring promotes the activity of the bees, and their summer prosperity. The food ordinarily supplied to bees is either the coarser kind of honey, or sugar and water. Strong ale and sugar boiled are also frequently given as food. The practice has very largely prevailed in Britain and elsewhere, of killing bees by fumes of sulphur, in order to take from them their honey in the end of autumn, a portion only of the increase of the stock being kept through the winter. This practice still has its advocates; but many now take only what they can by top boxes or *supers*, or by cutting out combs, preserving all hives which are not so light that there is no good hope of their surviving the winter. It may be doubted if, in almost any part of the country, the number of bees kept is so great as nearly to exhaust the floral resources, and in all probability this may yet become a much greater source of wealth than it is in Britain.

When honey is to be taken from bees, the person doing it must be carefully protected from their stings by gloves, veil, etc. It is best done during the heat of a fine day, when the bees more readily leave the combs of the *super* that is taken away, and return to their hive. A little gentle tapping generally causes them to leave the combs, and a feather is used for brushing off those which are slow to do so. The smoke of the common puff-ball (q.v.) causes them to fall down in a stupefaction from which they speedily recover, and its use is very convenient. It is gathered and dried for the purpose. Chloroform is also sometimes used for the same purpose, but the effect is apt to be fatal, unless care is taken to choose the morning of a fine day, so that the stupefied bees may have time to recover in the air and sunshine.

Bees are much less apt to sting when swarming than at other times, and in general all the necessary operations are performed without gloves or veil, and with perfect safety. The sting of a B. is to many persons a thing of no great consequence, although, in some, it causes great local inflammation and swelling, and general derangement of

health. The application of a little ammonia usually relieves the pain; or an onion cut through the middle; or the common "blue-bag" of a washer-woman.

The apiary should, if possible, be in a sheltered place, and where it enjoys a good amount of sunshine. The hives are very generally placed at small distances in the open ground, but some bee-keepers protect them by a shed. In the former case, each hive is usually covered with a straw-hood in winter, to keep away the rain, as damp is particularly injurious to bees. For the avoidance of damp, and to prevent the bees from coming in contact with the ground when they hang in a great cluster at the door of the hive—as they often do before swarming, when the weather is hot, and the hive very populous—each hive is raised to a height of at least 15 or 18 in. from the ground.

BEES, LAW RELATING TO. Bees are stated by Blackstone to be wild by nature (*feræ naturæ*), but when hived and reclaimed, are regarded in the nature of *property* belonging to the person on whose ground or soil they have swarmed; and in support of this doctrine he refers to the charter of the forest, 9 Henry III. c. 113, which allows every freeman to be entitled to the honey found within his own woods. The qualified property which may be thus held in bees continues while the swarm remains on the soil; and in the event of flight, so long as the owner can pursue it. Indeed, so clearly are they considered in law to be of the nature of property, that it has been decided in England that bees may be the subject of larceny (q.v.)

The same appears to be the Scotch law. Mr. Erskine, who may be described as the Scottish Blackstone, founding on the Roman law, lays down that when bees have abandoned their hive, not being observed and followed, they are understood to have recovered their original liberty; and if they light on the grounds of another, and are inclosed by him in a new hive, they become his property. See OWNERSHIP.

BEE, HUMBLE. See HUMBLE-BEE.

BEE, a co. in s. Texas, on the Arkansas river; 900 sq.m.; pop. '70, 1082—69 colored; a level, sandy, cattle-breeding region. Co. seat, Beeville.

BEECH, *Fagus*, a genus of trees of the natural order *cupuliferæ* (q.v.). The male catkins are almost globose, stalked, their flowers consisting of a bell-shaped 5 to 6-cleft perianth and 8 to 15 stamens. The female flowers, which grow on the same trees, consist chiefly of a germen with three awl-shaped styles, and are situated two or rarely three together within a stalked involucre, which bears on its outer surface many fleshy threads. This involucre, after the flowering is over, closes and forms a husk resembling a sort of capsule, which when ripe opens in four valves, is externally covered with soft spines, and incloses one or two (rarely three) triangular nuts, which bear the name of *beechmast*. —The species are not numerous; all of them are forest trees of great beauty.—The COMMON B. (*F. sylvatica*) forms whole forests in many parts of Europe. It grows to a height of 100 to 120 ft., and a diameter of 4 ft.; and particularly when standing alone becomes a very ornamental tree with far-spreading branches, which often droop gracefully almost to the ground. It has thin, ovate, obscurely toothed leaves, finely ciliated on their margins. Its bark is smooth, often of a whitish color; and it is remarkable for the frequency with which hard wooden knobs—abortive branches—occur in its bark. Grass does not grow readily under the shade of the B., but in B. woods may sometimes be found rare plants almost peculiar to such situations. The B. thrives best in light soils; and does not send its roots deep into the ground, but rather horizontally under the surface. The wood is more or less of a reddish-brown color, as the tree has grown in a dense forest, or has been freely exposed to sun and air. It is very hard and solid, but brittle; and when exposed to the open air, very liable to rot and to be eaten by worms. It is therefore not adapted to the purposes of the house-carpenter; but when kept always under water, it is very durable, and is accordingly employed in the erection of mills, and for weirs, sluices, etc. It is also employed for many purposes by cabinet-makers and turners. It is very much used in France for making the *sabots* or wooden shoes of the peasantry, being preferred for this purpose to every other wood except walnut, on account of its property of not absorbing water. It is one of the best kinds of firewood in Europe. Its ashes yield much potash and of excellent quality. The raspings of the wood are used in the preparation of vinegar. See VINEGAR and PYROLIGNEOUS ACID. The bark is sometimes employed for tanning when oak-bark is scarce. The B. bears lopping well, and is often planted for hedges; and it is a curious fact that when it is prevented from attaining a tree-like size, and is kept closely pruned, the withered leaves remain on the branches all winter, which is not the case in other circumstances. In some countries, as Dauphiny and Switzerland, the leaves of the B. are collected in autumn before they have been much frost-bitten, and are used for making beds or mattresses.—Beechmast, when fresh, has a sweet taste, like that of a walnut. It contains in large quantity a bland fixed oil, along with a starchy farina, a little sugar, and an astringent substance. A volatile, narcotic, poisonous principle, called *fagine*, is also found in it; but more in the rind than in the kernel: and when not only the smooth leathery outer rind, but also the thin brown inner pellicle have been removed, it is wholesome food. It is, however, more generally used for feeding swine, poultry, etc., and is much employed in France and other parts of Europe for the manufacture of *beech oil*, which, when expressed without the application of heat, and well clarified, has an agreeable taste, is fit for use as food, and keeps long without becoming rancid. When less pure,

it is used for lamps and in the arts. The oil-cake which remains is good food for poultry, for swine, and even for oxen, but is injurious to horses. Many manufacturers of cocoa adulterate it with beechmast, first depriving the cocoa of its oil, which they sell separately as cocoa-butter, and trusting to the oil of the B. for supplying its place.—B. forests anciently abounded in England, and great herds of swine were fed in them. The B. is not, in general, found in Europe n. of lat. 59°, although it occurs 2° further n. in the Scandinavian peninsula. It is found in the temperate parts of Asia and in North America; the WHITE B. of that country being generally regarded as the same species, a very common tree in some parts of the United States. In gardens and pleasure grounds a variety is very frequently to be seen, of which the leaves have a blood-red color. The same color appears also in some degree in the leaves of the RED B. of North America (*F. ferruginea*), which is distinguished by elongate-ovate, coarsely serrated, and much acuminated leaves. It forms extensive forests in the n.e. states and the adjoining British possessions; and its wood, which is of a somewhat red or rusty color, is more valued than that of the white B.—Two species of B. are found on the mountains of Java; four are natives of the more elevated parts of the s. of New Zealand; several belong to the s. of South America. The genus is, in fact, more characteristic of the colder latitudes of the southern than of the northern hemisphere. *F. betuloides* (also known as *F. Forsteri*) is the "myrtle tree" of the mountains of Tasmania—a very large tree with evergreen leathery leaves, in form much resembling those of the birch, although the general habit of the tree agrees with that of other beeches. The same species is the evergreen B. of Terra del Fuego, where it forms forests of which the dark-green foliage contrasts strikingly in winter with the dazzling snow. There can be little doubt that it will soon become a favorite and common ornamental tree in Britain. The wood is too heavy and brittle for masts, but makes tolerable planks, and is carried to the treeless Falkland islands for roofing houses. *F. Antarctica* ascends higher on the mountains about the strait of Magellan. It has deciduous leaves, and much resembles the common B.—*F. procera* grows in the Andes of Chili, and attains a majestic size. It is a valuable timber tree.

BEECH-DROPS. See CANCER ROOT.

BEECHER, the name of a celebrated American family of preachers and litterateurs.

LYMAN B. was b. at New Haven, Conn., U. S., Oct., 1775. He devoted himself to theology; and after holding the pastorate of Congregationalist churches at Litchfield and at Boston, he was in 1832 appointed president of the newly founded Lane theological seminary near Cincinnati. He died at Brooklyn in Jan., 1863. He was a powerful preacher and platform orator.—His son EDWARD, b. in 1804, became distinguished as a theologian.—Another son, HENRY WARD B., was b. at Litchfield, Conn., in 1813, and after graduating at Amherst college, Massachusetts, studied theology under his father at Lane seminary. After ten years' pastorship of two churches in the state of Indiana, he removed to Plymouth church, Brooklyn, N. Y., "an organization of Orthodox Congregational believers," where he still remains. He is said to have the largest congregation in the United States, and his popularity as a pulpit speaker and as a lecturer speedily became prodigous—owing partly to his rich fund of illustration, his dramatic manner, and his keen sense of humor. For nearly 20 years B. was editor of the *New York Independent*, a religious newspaper; in 1870 he became editor of the *Christian Union*, a similar publication. Intense interest was shown when in 1875 B. was tried for adultery. The jury were unable to agree on a verdict, the majority inclining to acquit him. B.'s influence is said hardly to have suffered, and the fidelity of his congregation is unshaken. His sermons known as the *Plymouth Pulpit*, his *Lectures to Young Men*, *Life Thoughts*, *Life of Christ*, and *Yale Lectures in Preaching*, have been largely read here and at home. He has visited Europe twice, last in 1864.

CATHERINE B., eldest daughter of Lyman B., was b. at East Hampton, L. I., in 1800. From 1822 to 1832, she was principal of a female seminary at Hartford, Conn., and afterwards of a similar institution at Cincinnati. She is a fertile and popular writer, chiefly on subjects coming within the sphere of her own sex, but also on physiology, theology, mental and moral philosophy, etc.

HARRIET B. See STOWE, H. B.

BEECHER, CATHERINE ESTHER (*ante*), 1800-78; b. N. Y.; eldest child of Lyman. Her mother died when C. was about the age of 16, and for two years she had the care of her father's house at East Hampton. When she was about 19 years old she was engaged to prof. Fisher, of Yale college, but he was lost in shipwreck on a voyage to Europe, and she remained unmarried. In 1822, she began a school at Hartford, Conn., and kept it until 1832, when she went with her father to Ohio, and opened a seminary for young women in Cincinnati, but was compelled to give it up two years later on account of ill health. She made it the business of her life to improve and advance the intellectual, physical, and practical education of women. She organized societies and schools for training teachers and sending them to new states and territories. In pursuit of this object she published *Domestic Service*, *Duty of American Women to their Country*, *Domestic Receipt Book*, *True Remedy for the Wrongs of Women*, *Letters to the People on Health and Happiness*, *Physiology and Calisthenics*, *Religious Training of Children*, *The American Woman's Home*, etc. She also published *Common Sense applied to Religion*,

Truth Stranger than Fiction, a memoir of her brother George, and *Appeal to the People as the Authorized Interpreters of the Bible.*

BEECHER, CHARLES, b. Conn., 1815; fourth son of Lyman; ordained in 1844, and became Congregational pastor in Newark, N. J., and afterwards in Georgetown, Mass. He assisted Henry Ward B. in the compilation of *Plymouth Hymns and Tunes*, and has published *The Incarnation, Review of Spiritual Manifestations, Pen Pictures of the Bible*, and, jointly with Mrs. Stowe, *Sunny Memories of Foreign Lands.*

BEECHER, EDWARD, D.D. (*ante*), b. 1804; second son of Lyman; graduate at Yale, and in theology at Andover; Congregational pastor in Boston from 1826 to 1831; in the latter year president of Illinois college, where he remained 13 years, and in 1844 was again in Boston, pastor of Salem street church. In 1856, he became pastor of the Congregational church at Galesburg, Ill. About eight years ago he retired from the ministry and removed to Brooklyn, where he now resides. Dr. B. has written on the theme that man is in a progressive state, the present being the outcome of a former life, and a preparation for one to succeed after death; that the struggle between good and evil will not end with this life, but in some future era all conflicts will be ended, evil will disappear, and harmony become established. These views are set forth in *The Conflict of Ages*, and *The Concord of Ages*. He has also published a work on Baptism, and one entitled *The Papal Conspiracy.*

BEECHER, HENRY WARD (*ante*), b. Litchfield, Conn., June 24, 1813; third son of Lyman; a graduate of Amherst college and of Lane theological seminary. He began his pastoral work over a small Presbyterian church in Lawrenceburg, Ind., in 1837; and in 1839 was settled at Indianapolis. In 1847, he was called to take charge of "Plymouth church," a new Congregational organization in Brooklyn, N. Y., where he has continued until the present time, a third of a century. Mr. B. soon became one of the most popular, as he was one of the most effective, pulpit speakers, and the growth of his congregation was unprecedented in church history in this country. There are at present (1880) nearly 3000 members, and the congregation has a good proportion of the intellectual, social, and financial force of the city. H. W. Beecher was a writer before he came to the pulpit, and his pen as well as his voice has been constantly active. He was, in 1837, editor of a journal in Cincinnati, and while preaching in Indianapolis he took charge of an agricultural publication, his papers being afterwards issued in a volume called *Fruit, Flowers, and Farming*. As soon as he came to Brooklyn he began, and continued for nearly twenty years, to write for *The Independent*, and was for two years its editor, 1861–63. His well known signature (a star, *) suggested *The Star Papers*, made up of select contributions to *The Independent*. About ten years ago he became, and is now, the editor of *The Christian Union*, published weekly in New York. As a preacher he is known perhaps more generally among the people than any other occupant of a pulpit in this country, and not only citizens but strangers make it a point to attend his church, which, though one of the largest in America, is almost always full when he is to preach. As an orator he is original in manner and matter, avoiding most of the routine and conventionalism of the ordinary service, and addressing himself as a man to his fellow. He brings in all manner of topics and illustrations, and sometimes ventures so near to the comic that laughter is scarcely restrained. As a lecturer he has had a long and successful career. In the long conflict with slavery he was an early and an earnest soldier, and from the pulpit of Plymouth church came many of the severest denunciations of human chattel-hood. Nor have other questions been neglected; temperance has had his earliest support, and politics are not ignored, for it is his belief that all things which concern the welfare of the people and the country are fit subjects for the public teacher. In his fierce denunciations of injustice he is singularly free from uncharitableness toward persons. Though a man of peace, he is enough of a soldier to don the uniform and appear on parade as the chaplain of a regiment. Of his more personal tastes, it may be said that he is fond of domestic and rural life, a student of nature, a lover of animals, flowers, and gems, and a judge and patron of art. During the civil war he visited England, and took especial care to enlighten the people as to the real issues and purposes of our great struggle, thereby materially aiding in the similar work undertaken by archbishop Hughes, Thurlow Weed, and others. For twenty years his sermons have been taken down in shorthand and printed, comprising now more than a dozen volumes, known as *The Plymouth Pulpit*. Among other works of his are *Lectures to Young Men, Industry and Idleness, Life Thoughts, Sermons on Liberty and War, The Plymouth Hymns and Tunes, Norwood* (a novel), *Yale Lectures on Preaching, The Life of Christ, Sermons from Published and Unpublished Discourses*, etc. Mr. B. is of stout build, florid, and of strong physical constitution. Recently he has built a charming residence at Peekskill on the Hudson, which he occupies during a large part of the summer.

BEECHER, LYMAN, D.D. (*ante*), b. New Haven, Oct. 12, 1775; d. Brooklyn, Jan. 10, 1838; descended from one of the New Haven colony of 1638. He lost his father when an infant and was adopted as a son by Lot Benton; graduated from Yale in 1797, and next year became pastor of the Presbyterian church at East Hampton, Long Island, and there married Roxana Foote, who increased their slender means by teaching school. Mr. B.'s sermon on the death of Alexander Hamilton (killed in a duel with Aaron

Burr in 1804) gave him immediate fame that rapidly increased until he was recognized as one of the foremost preachers in the country. In 1810, he went to Litchfield, Conn., where he was pastor of the Congregational church sixteen years. In 1814, he delivered and printed a series of sermons in favor of temperance, which added greatly to his reputation for eloquence and power. He was also foremost in the Unitarian controversy which pervaded eastern New England. In 1826, he became pastor of the Hanover street Congregational church, Boston. In 1832, he became president of Lane theological seminary, a new institution near Cincinnati, O., and held the office for twenty years, during ten of which he was pastor of the second Presbyterian church in Cincinnati. In 1835, he was tried by his presbytery for teaching false doctrines, but was acquitted on appeal to the synod. When the Presbyterian church separated, he went with the new school branch. In 1852, he returned to Boston, intending to revise and publish his writings, but his mental powers faded, and not very long afterwards he retired from public work. He was married three times, and had thirteen children, of whom all but three are now living (1880). George, a clergyman, was killed in 1843 by the accidental discharge of his gun. Dr. B.'s works have been published in three volumes.

BEECHER, THOMAS KENNICUT, b. Conn., 1824; son of Lyman; a graduate of Illinois college. He spent some time in teaching; became pastor of a Congregational church in Williamsburg (now the eastern part of Brooklyn), and afterwards of a similar church in Elmira, N. Y. He is the author of *Our Seven Churches*. He is a vigorous and spiritual preacher, a strong opposer of sectarianism, and a studious deviser of practical methods for bringing the influences of Christianity to bear through the church upon all classes in the community.

BEECHER (STOWE), HARRIET ELIZABETH. See STOWE, HARRIET ELIZABETH BEECHER, *ante*.

BEECHEY, FREDERICK WILLIAM, son of sir William B., the portrait-painter, was b. in London, Feb. 17, 1796. He entered the navy when he was 10 years of age, and at the age of 15 was present in an engagement off the coast of Madagascar, in which three French frigates were captured. In 1818, he took part under Franklin in a scientific voyage of discovery to the north pole, of which the results were published by order of the admiralty (1843). For the services he rendered with his pencil during this voyage, B. received a grant of £200 from parliament. In 1819, he was engaged in another arctic expedition under sir Edward Parry; and in 1821, rendered other important services to science by his exploration of part of the n. coast of Africa, of which the results were published in 1828. After being appointed commander, capt. B., in 1825, received a commission to proceed by the Pacific ocean and Behring's strait to the Polar sea, in order to communicate, if possible, with Franklin, who was to make the journey overland from North America. The explorers did not meet, although at one time they were within 150 m. of each other. He returned in 1828, having been two years and a half away, and in 1831 published a narrative of his voyage, which was afterwards followed by an account of the botany and zoology of the Arctic regions. Port Clarence and port Grantley, to the s.e. of cape prince of Wales, were discovered by B. in 1827. He was afterwards engaged in surveying the coast of Ireland and of South America; and was made rear-admiral of the blue in 1854. He died in 1856.

BEECHEY, Sir WILLIAM, R.A., an English portrait-painter of high reputation, was b. at Burford, Oxfordshire, Dec. 12, 1753. He entered the royal academy as a pupil in 1772, and devoted himself chiefly to portrait-painting, in which he was so successful, that in 1793 he was chosen portrait-painter to queen Charlotte, of whom he painted a full length. In the same year he was elected an associate of the royal academy; and in 1798, he received the honor of knighthood, and was made a royal academician for his picture of the review of the 3d and 10th dragoons in Hyde park by George III. (accompanied by the prince of Wales and duke of York), which is reckoned B.'s greatest work. Beechey now received the patronage of the royal family—most of the members of which sat to him—as well as that of the court nobility. Among his portraits are those of lord Nelson (preserved in the Clothiers' hall, London), sir William Hamilton, lord St. Vincent (in Fishmongers' hall), lord Cornwallis, John Kemble, and Mrs. Siddons. Beechey is not a portrait-painter of first rank, but his portraits are generally characterized by easy attitude and naturalness of expression. He retired from his profession in 1836, and died at Hampstead in Jan., 1839.

BEE'DER, the capital of a district of the same name in the Nizam's territories. It is about 75 m. to the n.w. of Hyderabad, being in lat. 17° 53′ n., and long. 77° 36′ e. It stands near the right bank of the Manjera, a considerable tributary of the Godavery, and occupies a table-land about 2400 ft. above the sea, and about 100 ft. above the adjacent country. Though B. was formerly a place of grandeur and importance, yet it is at present remarkable chiefly for its manufactures in a compound metal made up of 24 parts of tin to one of copper.

BEE-EATER, *Merops*, a genus of birds of the order *insessores* and tribe *fissirostres;* the type of a family, *meropidæ*, nearly allied to that of the kingfishers. The birds of the B. family have rather long slightly arched beaks, and long pointed wings: they are mostly of a green color; resemble swallows in flight; and, like them, prey on insects, but chiefly

on bees, wasps, and other hymenopterous insects. Their skin is very thick. The species of the genus *merops* are numerous in Africa and Asia; none are known in America; two are European, one of which, the common B. (*M. apiaster*), is common in the s. of Europe as a summer bird of passage. It is a very rare bird in Britain. It is mentioned by Aristotle, under the name *merops*, as very destructive to bees. It seizes them on the wing, and also often watches near their hives, and at the mouths of wasps' nests. It breeds in holes, which it excavates in the banks of rivers. "When the young are partly fledged, but not yet fit to fly, they creep to the mouth of their holes, where they seem to enjoy the happy summer light and genial sunshine; but on the least alarm, they trundle stern foremost into their inner chambers, where they lie concealed until tranquillity again prevails." In the banks of the Don and Volga, the excavations made by the flocks of bee eaters are so numerous, that the bank in many places resembles a honey-comb. Livingstone describes the banks of the Leeba, in South Africa, as perforated in a similar manner. The Hottentots watch the flight of the bee-eaters, that they may be guided to the nests of bees.

BEEF. See FOOD AND DRINK, DIET.

BEEF-EATER, a term now applied jocularly to certain functionaries belonging to the yeomen of the guard (q.v.), who, ever since the time of Henry VII., have formed part of the train of royalty, attending the sovereign at royal banquets and other state occasions. They have maintained the same costume, with a slight alteration made in 1858, for nearly four centuries; and this costume has had much to do with their attractiveness to sight-seers. The origin of the term is a case of what Dr. Latham calls "words of foreign simulating a vernacular origin." It was originally *beaufetier* or *buffetier* (Fr.), one who attends the *buffet* or sideboard. Similar instances of false etymology, arising from resemblance in sound, are seen in *Shot-over* (a hill near Oxford), from *Chateau Vert*; *sparrow-grass*, from *asparagus; ancient*, for *ensign; dog-cheap*, from the old English *god-kepe*, i.e., *good-cheap*, meaning *a good bargain;* etc.

BEEF-EATER, *Buphaga*, a genus of birds, of the order *insessores*, tribe *conirostres*, to which the name ox-pecker is also and more correctly given. The beef-eaters have short bills, square at the base, and rather swollen towards the point. They are accustomed to sit upon the backs of buffaloes, camels, and other large animals, and to feed upon the larvæ of gadflies, which they find in their hides. They are exclusively African. One of the species is the buffalo bird of South Africa. Livingstone mentions that the sight of the bird being much more acute than that of the buffalo, it is much more easily alarmed by the approach of danger; but the buffaloes always begin to look about them when the birds rise from their backs.

BEEF-TEA is a light and pleasant article of diet, obtained from the flesh of the ox. It is generally prepared by placing the meat (as lean as possible) in cold water, which is gradually heated, and then allowed to *simmer* for two hours or so; but the best method appears to be to commence by chopping the meat small, adding the cold water, and rapidly heating so as to bring it to boil. A little salt is then added to suit the taste. Either process, by commencing with cold water, succeeds in dissolving out of the meat the savory natural juices which it contains to the extent of about one eighth of its weight. Occasionally, hard-toasted bread, in fragments, is added to the tea just before being partaken of, which imparts to it some of the nutritious qualities of the bread. In using the beef-tea, the bread may or may not be eaten. The popular notion is, that the beef-tea contains all the nourishing constituents of the entire amount of meat employed in its preparation; but this is erroneous, as much nutritious matter is resident in the seven eighths of the original meat, left as residuary fleshy fiber, though the latter will, no doubt, prove of difficult digestion. The chemical constituents of beef-tea are *gelatin; albuminous matter; kreatine*, a substance resembling *theine*, the essential principle of tea and coffee; *extractive matters* (*osmazome*), to which the tea owes most of its odor and flavor, besides a part of its nutritious qualities; *lactic acid; salts;* a *little fat; saccharine matter*, and *water*. Beef-tea is highly palatable, and from its very easy digestion, it is recommended to invalids and convalescents. Mutton, treated in a similar manner, yields a broth or tea which is not so easily digested, and is hurtful to persons of weak stomach, especially if the fat be not skimmed off from the liquid. A knuckle of veal affords a similar broth or tea; but it is not so light as beef-tea, and, moreover, gelatinizes on cooling. A broth or tea prepared from a young chicken is, of all decoctions of animal matter, the most readily digested, and is specially suitable for invalids, where great irritability of the stomach exists.

BEEF-WOOD. See CASUARINA.

BEEHIVE-HOUSE, a name generally given to certain dome-shaped buildings in Ireland, which are believed to be among the oldest architecture remains in that country. They are round edifices, of no great size or height, built without cement, of long thin stones arranged in horizontal layers, the one slightly overlapping the other, and so gradually converging until they meet at the top. The doorway, which is square-headed, is somewhat narrower at the top than at the bottom, as in Egyptian architecture. Beehive-houses are of two kinds—single or clustered. The former are generally found beside ancient oratories, and are supposed to have been the dwelling-places of the priests;

the latter, which are often underground, show two or more hive-shaped chambers, connected by a passage or gallery, or opening from a larger central apartment, which is also hive-shaped. Irish antiquaries refer the beehive-houses generally to the period before the Anglo-Norman invasion of the island, in the 12th c., and claim for some of them an antiquity as high as the 7th and 8th centuries. Ruins of single beehive-houses are found in the western isles of Scotland; and some of the "Picts' houses," or "earth-houses," of the e. coast, seem to resemble the subterranean aggregated beehive-houses of Ireland.

BEELZEBUB (i.e., "the god of flies"). Under this name the people of Ekron, in Philistia, worshiped their god Baal (*q.v.*) or Bel. The Greeks also had their "Zeus Apomyios" or "Myiagros"—"the disperser of flies." As the heathen deities were all regarded as demons by the Jews, the name Beelzebub became, in course of time, commonly applied to the chief of evil spirits, and in this sense it is employed in the gospels. The more correct reading of the word, as given by the evangelists, is Beelzebul—an opprobrious change of name, making it signify "god of dung," to mark the low and groveling character of the demon. See BAAL.

BEEMSTER, the largest of the tracts of reclaimed or drained lands in the Netherlands, about 8000 acres, 12 m. n. of Amsterdam. There is a village of 2000 people in the district.

BEER, derived from the German *bier* (see ALE), is the term applied to a fermented liquid which has not undergone the process of distillation. It may be prepared from many varieties of vegetable matter, but in Britain the raw material operated upon is generally barley, although pease, beans, wheat, etc., might be employed. In other countries, B. is often prepared from other sources, to which allusion is made at the close of this article. The process followed in the manufacture of B. is divided into two parts —viz., *malting* and *brewing;* and so distinct are these, that very often the malting proceeds in a building at some distance from that in which the brewing is conducted, and in many cases the malting is superintended and accomplished by a *maltster*, as his particular and only branch of trade, the malt thus prepared being afterwards purchased by the brewer.

The variety of barley preferred for the preparation of the finer kinds of B. is the chevalier; but other varieties are extensively used. See BARLEY.

The process of malting, or the conversion of barley into malt, is accomplished in four successive steps. 1st. *Steeping* of the barley, which consists in introducing the grain into a large wooden or stone cistern, and adding thereto as much water as will cover it. On being thus treated for 24 hours, the grains of barley absorb the water, and the contents of the cistern, near the top, even begin to feel dry. The barley swells up much, so as to increase considerably in bulk, and the excise officers, if they choose, can gauge or measure the grain at this stage, and charge by the bulk thus indicated. The amount of water which barley takes up in the steeping, affords good evidence of the excellence of the grain for brewing. Thus, the better kinds of barley, on the average, take up sufficient water to increase their weight by one half. Occasionally, however, the increase is not more than a tenth. The time during which the grain lies in the steeping-cistern is about 40 hours, when the excess of water is drained off; but a regulation exists that the cistern cannot have a second charge of barley till four days have elapsed after the introduction of the first charge. 2d. *Couching.*—The grain is thrown out of the steeping cistern in a heap on the floor. At this stage the barley is soft, and when pressed between the fingers it is readily bruised. It lies in the couch or heap for 26 hours or so, and during that time it rises in temperature about 10° F., and gives out some of its extra water. This *sweating*, as it is called, is the result of the partial germination or growth of the barley; and little rootlets or fibrils of the radicle, and a primitive stem (plumula or acrospire) begins to form and present themselves. As the temperature rises, the radicles lengthen rapidly; and means are then taken to check the germination. 3d. *Flooring.*—The heated barley is spread by the workmen with spades on the floor to the depth of about 15 in. at first. It is repeatedly turned and respread over a larger area, with a thickness of layer decreasing to 6 inches. At this stage the radicles have attained their greatest length. 4th. *Kiln-drying.*—The half germinated barley is now introduced into a kiln, on the perforated floor of which it is spread. The apartment beneath the kiln-room is fitted up with stoves or choffers, which evolve much heat; and this, rising and passing through the slits or perforations in the floor of the kiln, necessarily dries any moist barley laid thereon, and the steam escapes at the roof. The heat which the barley is subjected to in the kiln is, at the commencement, 90° F., but this gradually is raised to about 150° F. While drying, the radicles—called *cornings* or *cummings*—break off from the grain, and are afterwards removed by a wire-sieve. The color which the barley assumes as it becomes dry malt in the kiln is determined by the heat to which it is subjected, the higher temperature yielding the dark-colored malt. *Pale* and *amber colored malt* are used in the brewing of the lighter varieties of B., such as bitter-beer, table-beer, and small-beer; whilst a darker kind of malt is used in sweet ale, and a very dark malt in the preparation of porter. During the conversion of barley into malt a loss of material occurs. Thus, 100 parts of barley yield 80 parts of malt; but as the 100 parts of barley contain 12 of water, it follows that there are present only 88 parts of dry matter, and these yield 80 parts of dry malt, giving a loss of 8 per cent of the original weight of the

barley. While there is a decrease in weight, there is an increase in bulk, 100 measures of barley becoming 101 to 109 measures of malt. Certain chemical changes likewise occur as the barley is transformed into malt, which may be noticed from the following table:

	Composition of Barley.	Malt.
Hordein (q. v.)	55	12
Starch	32	56
Sugar	5	15
Gluten	3	1
Gum	4	15
Resin	1	1
Total	100	100

The principal chemical change is, therefore, the transformation of much hordein (a form of starch) into starch, gum, and sugar. The mechanical condition of the contents of the grain is also altered; the grain is now of a fine mealy nature, and is readily broken between the fingers, when the flour in the interior is found to be soft and distinctly sweet to taste.

The *brewing* of the malt comprehends no less than six stages. 1st. *Grinding the malt*, which may be accomplished in several ways: either by placing the malt between two revolving horizontal circular stones, such as are employed in flour-grinding; or passing the malt through a mill like a large coffee-mill; or bruising it between revolving steel rollers. The last plan is the best, as it is desirable that the grinding should not be too perfect, which would give a fine flour, readily becoming pasty on the addition of water. When coarsely bruised, however, the water can find its way into all parts of the grain, and thoroughly soak it. 2d. *Mashing the bruised malt.*—This operation is conducted in a large tun, built up of wooden staves, and surrounded by hoops—somewhat similar in construction to an ordinary domestic churn. Water, which has been previously heated in a copper, is allowed to run into the comparatively cold mash-tun, while the bruised malt at the same time descends by the hopper, the water thereby becoming reduced to 160° F., or slightly below that temperature. The whole is then thoroughly agitated by long poles, worked by the hand or by machinery, till every particle of the malt is brought into contact with the water. The result is that the malt absorbs the water in part, and a very active change begins to take place. In the malt, there is developed a substance called *diastase* (q.v.), which reacts on the starch of the malted barley, and changes it into the variety of sugar called grape-sugar. See SUGAR. So rapidly does this transformation of starch into sugar occur, that almost immediately on the mixing of the water with the bruised malt, the liquid assumes a sweet taste. In the space of half an hour the temperature of the mash-tun will be found to have decreased to about 140° F.; and then a second quantity of water, at a heat of 190° F., is run in, so as to raise the temperature to about 167° F., which degree of heat is found to be the best for enabling the diastase to act most powerfully in transforming the starch into sugar. After two or three hours' action upon the malt, the water, which is now very sweet to the taste, is drawn off into a large vessel called the *underback*, and fresh water, at a temperature of about 190° F., is admitted to the tun, and allowed to soak the malt still remaining there. This part of the process is styled the *second mash;* and as the water is at a higher temperature than in the *first mash*, much of the residuary matter in the malt is changed into sugar, and dissolved. After some hours, the liquid from the second mash is drawn off, and added to that of the first mash already in the underback; and a third quantity of water, at a still higher temperature, about 200° F., is run in upon the malt, which dissolves out all the remaining portions of any value, and leaves the husk skin of the grain and other insoluble matters. The liquid from the *third mash* is not strong enough to be in general mixed with the other solutions in the underback, and is either employed in brewing small beer, or is again heated and used in treating new bruised malt.

In order that the brewer may be enabled to prepare the same variety of B. day after day, it is requisite that the liquid in the underback, and which is now called the *sweet-worts*, should be of a definite strength; and to determine this, an instrument called a saccharometer, a form of *areometer* (q.v.), is used, which enables the brewer to determine the strength of the sweet-worts, and, if necessary, to add some of the liquid from the third mash, to reduce the strength of that in the underback.

In the drawing off of the several worts from the mash-tun, advantage is taken of a finely perforated false bottom of plate-iron, which lies about a foot above the true bottom of the tun, and the liquids being drained away through the perforations in the false bottom, the insoluble husk and other matters are left behind. The material left on the false bottom, called *grains* or *draff*, is used for feeding cattle.

3d. *Boiling of the worts with hops.*—When reduced to the proper strength, the worts are pumped up from the underback into a covered-in boiler or copper, and being mixed with hops, are raised to the boiling-point, and kept in a state of ebullition for some time. During the boiling, it is necessary to keep the hops and other sediment from settling at the lower part of the boiler near the fire, and for that purpose a sort of rake with

teeth, turned by a wheel above, is kept turning round, which tends to hold the sediment in mechanical suspension. To economize heat, it is customary to have a tank fitted to the upper part of the boiler in which water or the worts can be heated. The hops which are obtained from Kent and Sussex are the strongest, and are employed in the brewing of porter, while the Worcester hop is milder, and is preferred for ale. The hops are useful in the brewing of B. in imparting to the liquor a volatile fragrant aromatic oil, a bitter resin, and a little tannin. The quantity of hops required to be added depends much on the kind of B. which it is intended to brew. The stronger the B. is to be, and above all, the more bitterness is required, the more hops must be added to the boiler. In common ale or B., the quantity of hops does not exceed 2 lbs. to the quarter of malt; whilst in bitter-beer, and especially that intended for foreign countries, the amount of hops is 8 lbs. and upwards. Besides imparting to the worts the active constituents of the hop, the boiling operation serves other important ends. In the sweet-worts, there is a considerable quantity of nitrogenous matter, which is very liable to pass into decomposition, and which, were it to do so, would destroy the beer. During the boiling, the excess of this nitrogenous matter separates as a flaky and stringy solid, called by the brewer *mucilage*. The boiling is continued till the hops have yielded their aromatic and bitter principles, and till the liquid has been concentrated to the extent required by the brewer, and then the whole is run into the *hop-back*, a form of cistern which has a false bottom composed of perforated iron plates, admitting of the liquid worts percolating through, while all the mucilage and other solid matters are retained on the upper surface of this metallic sieve. 4th. *Cooling the worts.*—As the liquor drains through the false bottom of the hop-back, it is run on to the *cooler* or *refrigerator*, which, in size and appearance, resembles the ordinary wooden floor of a large room. The planks are so closely connected together that the liquid cannot run through, and a wooden ledge runs round the sides of the room, which is also tight. The hot worts, which are spread to the depth of a few inches over the floor, are very rapidly cooled down, by allowing a free current of cold air to pass over the top of the liquid, and often by having a series of fans revolving rapidly immediately above the liquid, so as to cause a more speedy removal of the heated air loaded with steam, and the substitution of cold air. Occasionally, the brewer is at the expense of having a coil of metal pipe, placed up and down the floor of the cooler, through which metal pipe cold water is allowed to run at the time the hot worts are being cooled down. By these means the worts are very soon reduced to a temperature of about 60° F. This step in the process of brewing is a very important one, as, if the cooling is not conducted with the greatest rapidity, the sugar in the worts will become partially converted into acetic acid, or, as it is termed, *foxing* occurs, which communicates bad properties to the worts, and ultimately produces a beer with an unpleasant taste and flavor. 5th. *Fermenting the worts.*—When the liquid has been cooled down to 55° to 60° F., it is conveyed to the fermenting tun, where it is mixed with the yeast (q.v.), and the process of fermentation proceeds. The tun or vat is formed of strong wooden staves, and is either circular or square. The latter form has recently been introduced, and appears to be preferred by some brewers. The yeast is added in varying quantity, according to the strength of the worts, but the more common amount is one gallon to every 100 gallons of the worts. Very soon after the yeast is mixed with the worts, the whole contents of the tun begin to pass into a state of commotion, much gas is evolved, and this, tending to escape, causes a *frothing* on the surface of the liquid termed the *rocks*, from the irregular mountainous appearance of the masses of froth piled on each other. The color of the froth at this period indicates the quality of the beer. Thus, if the froth appears of a yellowish-white or yellow tint, the operation is going on satisfactorily; but if the color darkens to a brownish yellow or a light brown, it is considered a bad sign, and the beer is spoiled as a first-class beverage. The chemical changes which occur during the process of fermentation (q.v) are due to the action of the particles of yeast on the sugar or saccharine matter. This action proceeds most satisfactorily at a temperature of 72° F., and care is taken in the brewing of the finer varieties of B., such as India pale ale and bitter-beer, that the temperature never exceeds 72° F. The grape sugar which is present in the worts as they are introduced into the fermenting tun, is composed of carbon, hydrogen, and oxygen in the proportion C_{12}, H_{14}, O_{14}; and when the yeast acts upon it, a greater or less proportion of it is converted into alcohol, carbonic acid, and water. Thus, one atom of sugar, $C_{12}H_{14}O_{14}$, is converted into 2 atoms of alcohol ($C_4H_6O_2$) = $C_8H_{12}O_4$; 4 atoms of carbonic acid (CO_2) = C_4O_8; and 2 atoms of water (HO) = H_2O_2; which, when added together, give the atom of sugar, $C_{12}H_{14}O_{14}$. The carbonic acid tending to escape, causes the frothing or rocks, and the alcohol and water are left in the fermenting tun. During the progress of the fermentation, a considerable amount of new yeast is formed, which gets entangled in the froth; and when the operation slackens, and the frothy head begins to fall, the upper yeast is skimmed off. This process of the conversion of the sugar of the worts into alcohol or spirit, is termed attenuation (Lat. *tenuis*, thin); and the degree to which the change is carried depends on the kind of B., and the market it is to be sent to. In sweet ale or B., the attenuation is not allowed to proceed far, and much sugar is left in the beer. Bitter-beer, however, is attenuated to a greater degree, and consequently there is less saccharine matter left in it; while in India pale ale, and other beers intended to be sent great distances, the attenuation must be carried on much further,

else the liquor would not be preserved during its transit to many parts of the globe. 6th. *Clearing* and *storing*.—The B., when properly fermented, is placed in casks like hogsheads, called *rounds*, where the remaining traces of fermentation proceed, and the B. ceases to appear thick or drumly, and becomes clear; when it is pumped up into store-casks of great size, or at once placed in the casks in which it is sent into market. During the storing of the B., an extra quantity of hops is often added, to increase the bitterness and pungency.

The principal constituents of the various kinds of B. are water, alcohol, sugar, gum, gluten, and the bitter extractive matter of the hop. The amount of alcohol varies: in small-beer, it is only about 1 per cent; in ale, the stronger kinds of B. and porter for home consumption, 5 to 7 per cent; in East India pale ale, 10 per cent. In B. intended to be forwarded to California from Britain, the attenuation is carried so far, that there is more than 10 per cent of alcohol, and the B. is then called *dry*.

B. is adulterated in many ways. Burned sugar (caramel) is added to give color; cocculus indicus, to supply an intoxicating agent which will give an appearance of strength to the B.; quassia, to impart bitterness in place of hops; grains of paradise and Cayenne pepper, to communicate pungency; coriander and caraway seeds, to yield flavor; liquorice, treacle, and honey, to supply color and consistence. To stale beer there is sometimes added green vitriol (sulphate of iron), or alum and common salt, which, when agitated with the B., communicate a fine cauliflower head. It is unnecessary to state that such admixtures are never made in any extensive brewing establishment with respectable connections.

For the home-brewing of B., many recipes have been published, and one of the best is that given by Mr. Donovan in the *Cabinet Cyclopedia*. The apparatus he suggests is of the roughest description, and comparatively inexpensive. A porter-barrel forms the mash-tun; the upper end being taken out, perforated with a gimlet, and lowered into the barrel to near the bottom, where it is supported about a couple of inches from the true bottom, and constitutes the false bottom through which the liquid drains from the bruised malt. A hole is made in the side of the barrel, near the bottom, and between the true and false bottoms, which can be plugged up with a spigot when not required to let the liquor run off. A second porter-barrel will be useful as an underback and fermenting tun. An ordinary household boiler, or a large common tin-plate one, will answer the purpose of boiling the worts. The mash-tun is first well scalded with hot water, and then is supplied with 15 galls. of boiling water and 5 galls. of cold water at 60° F., 2½ bush. of first-class bruised pale malt are shaken in, and well stirred through the water, the top of the barrel being in greater part closed with a thick cloth. In an hour or so, the liquid which is in the tun will be clear when allowed to run out at the spigot-hole; and immediately after it ceases to run, about 20 galls. of nearly boiling water are run over the half-exhausted malt, and this carries off all the soluble matters, yielding altogether about 23 galls. of sweet-worts. These are placed in the copper, 3½ lbs. of the best mild hops are added, and boiled for 20 minutes. The liquor is then strained through a fine sieve into the fermenting tun; and when it has cooled down to below a blood-heat (98° F.), a quart of yeast is added, and the fermentation allowed to proceed. When the frothy head begins to droop, the upper yeast is skimmed off, the liquor put in a cask, bunged up, and allowed to clear for a fortnight, when it will be ready for use.

The foregoing remarks on the manufacture of B. apply to all the varieties of B., ale, and porter (q.v.), brewed and used in Britain. The liquor may differ in strength, from difference in the quantity of water, or in color, from the malt being more or less charred in the kiln-drying. There are, however, many other varieties of beer. In South America, the Indians prepared and drank a B. obtained from Indian corn, and called *chica* or maize B., long before the Spanish conquest. The process followed in making chica is similar to that of beer-brewing in Britain. The maize is moistened with water, allowed partially to germinate, and dried in the sun. The maize malt so prepared is bruised, treated with warm water, and set aside till the fermentation is over. The chica or maize B. has a yellow color, and a pleasant acid taste. In the valleys of the Sierra, the maize malt is chewed between the teeth of the Indians and their households, and the chewed morsel incorporated with the saliva is put in jars with hot water, when the fermentation proceeds more rapidly than before, and a more highly-prized B. is obtained. The chica is also made from barley, rice, pease, manioc, pineapples, and grapes. The Crim Tartars prepare a B. from millet-seed, called *bouza* or millet-beer. The same seed is used in Sikkim, on the southern slopes of the lower Himalaya, and yields B. there called *murwa*. The Arabians, Abyssinians, and many African tribes employ *teff*, or the seeds of *poa Abyssinica*, and millet-seed, as sources of beer. The Russians prepare a B. from rye called *quass* or *rye-beer*. The Tartars ferment milk into *koumiss* or milk-beer. The Arabians use the milk to yield their *leban*, and the Turks to produce their *yaourt*. In the n. of Scotland, the Orkneys, and some parts of Ireland, buttermilk, or *sour-milk*, is allowed to stand till fermentation begins, and an intoxicating liquor results. The South-sea islanders prepare a B. from the root of *Macropiper methysticum*, or *the intoxicating long pepper*, which is called ava (q.v.).

The successful brewing of B. depends much on the kind of water employed. The water which is found most suitable contains much common salt, sulphate of lime, and

carbonate of lime, in a state of solution. The waters employed in the most extensive breweries contain at least 60 grains of earthy salts dissolved in each imperial gallon. Great care must be taken to select water which not only has the proper amount of saline ingredients, but at the same time is free from organic matter either of animal or vegetable origin. Water containing such is liable to the decomposition and putrefaction of its constituents, and by contamination, causes the B. prepared by means of it to be more liable to go wrong in the brewing, and to possess ultimately an unpleasant taste.

The employment of B., especially of that variety known as bitter-beer, has recently rapidly advanced in public estimation as a beverage and article of diet. Bitter-beer acts as a tonic and slight stimulant, and in many cases it is recommended by medical men to convalescents in place of wine. Some statistics regarding the consumption of the different kinds of B., and other kindred beverages, will be found under FERMENTED AND DISTILLED LIQUORS.

BEER, J. MEYER. See MEYERBEER.

BEER ACTS, the 11 Geo. IV. and 1 William IV. c. 64, the 4 and 5 William IV. c. 85, and the 3 and 4 Vict. c. 61, amended by the wine and beer-house acts, 32 and 33 Vict. c. 27, 33 and 34 Vict. c. 29, and the intoxicating liquor acts, 35 and 36 Vict. c. 94, 37 and 38 Vict. c. 49. By the earlier of these acts (all relating to England), every householder assessed to the poor-rates, in any parish or place (and not being a sheriff's officer, or officer employed to execute judicial process), could, without any license from the magistrates, apply for and obtain an excise license, to enable him to sell beer and cider, by retail, at some house situated within such parish or place, and specified in such license. But in order to obtain such license the applicant must produce an overseer's certificate that he was the real resident, holder, and occupier of such house, and rated to the poor-rate in a certain amount; and must enter into a bond with one sufficient surety, in the penal sum of £20, or two sufficient sureties in the penal sum of £10 each, for the payment of such penalties as he may incur under the acts; and if he is also desirous for permission that the liquor should be drunk *on the premises*, he must, moreover, annually deposit with the commissioners of excise (now the board of inland revenue), or other person authorized to grant the license, a certificate "of good character," signed by six rated inhabitants of the parish, of whom none shall be maltsters, common brewers, or licensed publicans, or owners of licensed public-houses. These requirements were easily evaded as regards the evidence of good character, and in 1869 the new practice was introduced by the wine and beer-house act, 32 and 33 Vict. c. 27, of not only requiring the house to be of a certain valuation, but the applicant to go first to the justices of his division or borough for a certificate, which thus enabled some inquiry to be made into the respectability of the persons keeping beer-houses. This certificate of justices, sometimes also called a justices' license, is indispensable before getting an excise license. It is, moreover, required that every person obtaining a license, shall paint conspicuously over the door of his premises, in such form and manner as the acts specify, his Christian name and surname at full length, and the words "licensed to sell beer (or cider) by retail," with the addition of "to be drunk on the premises," or "not to be drunk on the premises," as the case may be. Penalties are also imposed on every retailer of beer or cider who shall transgress, or allow to be transgressed, any of the numerous and stringent provisions of the licensing acts 1872–74. The license to sell beer is confined to that particular privilege; and persons, under cover of it, attempting to sell wines or spirits, are not only liable in a heavy penalty, but may be deprived of their beer license. On the other hand, a license to sell wines and spirits is quite distinct; but all excise licenses to retail liquors must be preceded by a justice's certificate.

The wine and beer-house acts of 1869 and 1870 still mainly govern the qualifications of those who sell beer by retail, and a similar law is applied to those who sell wine and liquors by retail in refreshment houses. The law was, however, deemed imperfect as regards the offenses which the keepers of licensed houses are prone to commit, and it required the intoxicating liquors licensing act of 1872, c. 94, and of 1874, c. 49, to create more uniformity as well as stringency in the requirements. During Sundays, all licensed houses require to be shut except between 12½ or 1 P.M. and 2½ or 3 P.M., and between 6 P.M. and 10 or 11 P.M., the justices having a slight power to vary these hours. A fixed time of opening and closing is also prescribed for week-days. When a keeper of the house is convicted of an offense, it is usually indorsed on his license, and after three indorsements he forfeits the license; and, in some cases, even the landlord's power to relet the house for the sale of liquors is suspended for some years, according to the nature of the offenses. Though the houses are closed for part of Sundays, yet travelers and lodgers are exempted in most cases, and can be supplied as usual with liquors. Some of the penalties have been admitted to be too severe, and require modification.

The place where beer is exclusively sold is called a *beer-house*, differing in this respect from an *ale-house*, which means a place where other liquors as well as beer are retailed. The term *public-house* applies to the second most frequently.

The sale of beers or ales in Scotland is regulated by the act 25 and 26 Vict. c. 35, amending the act 9 Geo. IV. c. 58, and the 16 and 17 Vict. c. 67, commonly called the "Forbes Mackenzie act." Justices and magistrates meet twice a year to grant certificates. By the form of license thereby prescribed, no liquors of any kind can be sold on

Sunday in any inn, hotel, shop, or any public-house, except to lodgers and travelers. In the English acts the words "*bonâ-fide* travelers" are used, which mean the same thing, and they are held to include persons traveling two or three miles for business or pleasure. Many of the penalties of the act 25 and 26 Vict. c. 35, exceeded those of the English acts, but the English act of 1872 far outstripped in stringency (except as regards Sunday) the Scotch acts.*

BEERBHOOM', or BIRBHOOM', a district in the lower provinces of Bengal, with an area of 1344 sq.m., and a pop. (1871) of 695,921. It extends between n. lat. 23° 32′ and 42° 40′, and between e. long. 86° 25′ and 88° 30′. The chief town is Suri, 100 m. n.n.w. of Calcutta, and after it the district is sometimes named. The inhabitants are generally a rude race, and there appear to be hardly any places worthy of the name of towns.

BEER-MONEY was a peculiar payment to non-commissioned officers and soldiers in the English army. It was established in the year 1800, at the suggestion of the duke of York, and consisted of one penny per day for troops when on home-service, as a substitute for an issue of beer and spirits. It continued as an addition to the daily pay until 1873, when, the stoppages for rations having been abolished, the opportunity was taken to consolidate beer-money and pay proper.

BEER SHEBA, or BIR-ES-SEBA ("well of the oath," or "well of the seven"), so called because here Abraham entered into an alliance with Abimelech, king of Gerar, which he ratified with an oath and a gift of seven ewe lambs. B. was situated on the southern border of Palestine, about 52 m. s.w. from Jerusalem, and formed the limit in that direction of the Israelitish dominion. It was one of the most ancient as well as one of the most interesting places in sacred record. While Abraham resided at this place, he received the command to sacrifice Isaac, whose residence it also was. Esau was robbed of his birthright and blessing here, and here Jacob sacrificed to God before departing into Egypt; the sons of Samuel were made judges here, and it was from hence that Elijah was forced to flee into the desert from Jezebel's wrath. After the captivity, B. was occupied for some time by the Jews, and in the 4th c. A.D., it was a Roman garrison. Afterwards, the crusaders are said to have fortified it, and to have regarded it as a place of importance. Two circular wells of fine pure water—the largest being 44 ft. deep to the surface of the water, and 12½ ft. in diameter—and a heap of ruins about half a mile long and a quarter broad, remain to mark the place where B. once was.

BEE'SHA, a genus of grasses with the habit and most of the characters of bamboos, but remarkable for the fleshy pericarp which incloses the seed, forming a sort of berry. The species are few, natives of the East Indies.

BEES-WAX is principally obtained from the ordinary bee-hive, where it is elaborated by the workers. See BEE. For some time, it was matter of dispute whether the bees really manufactured the wax from other ingredients in their food, or if they performed the simple task of carrying the wax ready made from the plant to the hive. It appears now to be definitely settled, that while, in ordinary circumstances, bees may derive part of the wax from plants, yet, when they are fed entirely upon pure sugar, they continue to elaborate wax, and to build up the walls and partitions of the honey-comb. The wax procured from British hives is considered the purest and best, but the smallness of the amount necessitates the importation of comparatively large quantities from North America, Brazil, Singapore, Ceylon, Gambia, and Mogadore. British bees-wax is naturally of a yellow color, whilst that procured from foreign countries is darker in tint; and in the case of the wax from Brazil, which is yielded by a species of black bee living under-ground, the color is a dark mahogany, and the material is soft and tenacious. In the separation of the honey from the wax, the honey-comb is subjected to pressure, which squeezes out most of the honey; the residual comb is then treated with water, and heated, with constant stirring, till the wax melts, when the whole is passed through hair-bags. The wax is received in a vessel of cold water, where it is at the same time washed, and cooled down till it solidifies, as a thick cake, on the surface of the water. For many purposes, it is necessary to bleach the wax, and the common method is to obtain it in thin sheets or ribbons, by melting it under water, and pouring it upon horizontal wooden cylinders, which are kept revolving half immersed in water in a perforated vessel. The sheets or ribbons of wax so obtained are laid out upon a field with a southern aspect, and being repeatedly watered, are subjected to the joint action of the sun's rays, the ozone of the air, and moisture. In a short time, the wax loses its yellow tint, and becomes white. Attempts have been made to perform the bleaching more expeditiously by employing chlorine, bleaching-powder, and other chemical agents. The only process which appears not to injure the wax is to melt it, and for every pound add 2 ozs. of pulverized nitrate of soda, and 1 oz. oil of vitriol, diluted previously with 8 ozs. of water. While the latter is gradually poured in, heat is applied, and the whole mixture swells up, necessitating the employment of a capacious vessel. On cooling, the

*A shebeen is the name given in Scotland to a house or place where liquors are sold without a justice's or excise certificate. Every person found in such a place, drunk or drinking, may be taken before a justice, or detained in a police-station till this can be done, and he may then be fined ten shillings, or, in default, imprisoned ten days.

wax gathers on the surface, and being repeatedly treated with hot water, to wash away impurities, is finally allowed to solidify in a cake.

Purified B. has a density of 960 to 966, and is therefore lighter than water, which is taken as 1000. In thin slices, it is translucent, and is tasteless, odorless, and colorless. At 32° F., it is hard, brittle, and solid. When heated to 85° or 90° F., it softens, and can then be kneaded between the fingers like moist dough or putty, and at 145° F. it fuses, and becomes a true liquid. It is insoluble in water, and is partly soluble in boiling alcohol, and partly not. The alcoholic solution, which takes up about 80 to 90 per cent of the wax, contains principally a substance called *cerine*, which separates in crystals as the solution cools, and *cerolein*e, which remains dissolved in the cold alcohol. The matter which resists the solvent action of the alcohol is a substance called *myricine*. B. is largely used in the manufacture of wax-candles and tapers; and though it has recently been very much excluded from the manufacture of ordinary candles, from the readiness with which first-class composite candles can be made indirectly from tallow, yet it is often used as one of the ingredients in composite candles to impart hardness to the manufactured article. The very large candles used in Roman Catholic countries for church-services, are always made of wax alone.

BEET, *Beta*, a genus of plants of the natural order *chenopodiaceæ* (q.v.), distinguished by a 5-cleft perianth, 5 stamens inserted on a fleshy ring surrounding the ovary, and the fruit adhering to the calyx, and collected in clusters of two or three. The species are not numerous; they are mostly biennials, with smooth, ovate, stalked root-leaves, and tall, leafy, flowering-stems. They are natives of the temperate parts of the old world. The COMMON B. (*B. vulgaris*) is a native of the shores of the Mediterranean, but is now in very general cultivation both in fields and gardens, chiefly for the sake of its large succulent and generally carrot-shaped roots, which are used as food both for man and for cattle, and from which also sugar is largely extracted on the continent of Europe. Beet-roots may be substituted for malt, when deprived of the greater part of their juice by pressure. The variety chiefly cultivated in gardens is known as RED B., from the color of the root, which also more or less appears in the leaves and leaf-stalks. The subvarieties are very numerous. In some, the root is rather turnip-shaped than carrot-shaped, and the size and color also vary much, some being of a deep blood-red, or even almost blackish color, both externally and internally; and others of a much lighter red, and internally even white. It forms a favorite pickle, and is also very agreeable as a boiled vegetable when properly dressed. The seed is sown so late in spring, that the plants may not produce flowering stems the first year, which, when it occurs, renders the root fibrous and useless.—MANGOLD-WURZEL (q.v.), so valuable as a field-crop for food of cattle, is, in general, regarded as merely a larger and coarser variety of the common B., in which the red color is comparatively little exhibited, although some botanists have, on very slender grounds, endeavored to erect it into a distinct species.—The WHITE B. of our gardens (*B. cicla* of some botanists) is now also generally supposed to be a mere variety of the common B., with little or no red in its roots or leaves, and a comparatively slender root. It is cultivated for the sake of its leaves, which are used in the same manner as spinach, and form an excellent substitute for it, especially in the beginning of spring. The leaf-stalks and midribs (*chards*) of the leaves, especially of a variety in which these parts are unusually developed, are also dressed for the table.—SEA-B. (*B. maritima*) grows wild upon the shores of Britain, and differs from the common B. in its perennial root, its partly prostrate stems, and other characters. The leaves are used for food in Ireland, as are those of *B. Bengalensis* in the East Indies.

BEET-FLY, *Anthomyia Betæ*, an insect which infests crops of mangold-wurzel, and other kinds of beet, depositing its eggs on the leaves, the soft parts of which the larvæ devour, causing them to assume a blistered appearance, and when numerous, injuring the health of the plants. It is a two-winged insect (see DIPTERA), of the great family *muscides*, of which the common house-fly may be regarded as the type, and belongs to a genus of which more than 100 British species are known, the larvæ of some of which are well known as feeding upon the roots of cabbages, turnips, etc. See CABBAGE-FLY, TURNIP-FLY, and POTATO-FLY. It is not so large as the common house-fly.

BEETHOVEN, LUDWIG VAN, the unrivaled composer, whose works have made a new epoch in the development of music, was born at Bonn, Dec. 17, 1770, and died in Vienna, Mar. 26, 1827. His father, a tenor-singer in the elector's chapel at Bonn, began to cultivate the genius of his son when only five years of age. He next placed him under the court-organist, Van Eden, and shortly after under the composer Neefe. In his eighth year he created astonishment by his performance on the violin; when only 11, he played the music in Bach's *Wohltemperirtes Klavier ;* and in his 13th year he published, at Manheim, a volume of variations on a march, songs, and sonatas. In 1792 he was sent to Vienna by his patron, the elector of Cologne, to enjoy the instructions of Hadyn, who first made him acquainted with the works of Händel. He also studied composition under Albrechtsberger. There he soon attracted notice by his extraordinary ability as an extempore player of fantasias, and also by some compositions, which, however, did not escape the censure of critics. He became so much attached to Vienna, that, after his patron's death in 1801, he determined to remain, and declined an invitation to

England. In 1809, when another offer tempted him to leave Vienna, several friends of music, with the archduke Rudolf at their head, raised a subscription to provide for the composer a pension sufficient to retain him. At Vienna, therefore, he stayed during the remainder of his life, secluded from the world, of which he knew as little as it knew of him; and in later years, still more isolated from society by a defect of hearing, which gradually became confirmed into entire deafness. In this sad inviolable solitude, he produced his new symphonies, his sublime overtures, his quintets and quartets, so full of profound conceptions and mysterious revelations of the highest harmonies, and his pianoforte sonatas, which express, sometimes, a peculiar train of feelings, at other times appear to represent his own recluse character. Shut out in a large measure from the ordinary pleasures of life, ignorant of the sweetness of married life, and able to enjoy only in a slender measure social intercourse, he retired for compensation into the world of his own imagination, and brought forth from its deep resources those treasures of harmony which, though at first received with a shy astonishment rather than a cordial admiration, are now ranked among the works of art which cannot die. These new forms and original creations, which display B.'s majestic powers in music, were only gradually developed; in his early productions, he submitted to established forms of composition.

The works of B. may be divided into three classes, or may be assigned to three distinct periods of his intellectual development. All the works of his first period, though important, show the influence of his teacher Hadyn, or of his more highly esteemed model, Mozart. This period of composition may be said to extend to his 16th orchestral work, including, besides several pianoforte sonatas, trios for pianoforte and for stringed instruments. All these early works display the highest cultivation of the forms and principles of art previously established in the Viennese school of music.—The second period of B.'s artistic life, in which his genius was completely self-reliant, extends from the 16th to the 80th work. This was certainly the most productive and brilliant part of his career. To it belong his greatest creations, his magnificent and powerful orchestral works—symphonies, overtures, etc.—all of which display the highest qualities of imaginative composition. Besides the great orchestral works, it includes many sonatas for pianoforte, and various compositions of chamber-music—septets, quintets, quartets, trios, serenades, etc. In dramatic composition, B. produced only one opera, but this was *Fidelio*, the first truly German musical work of a dramatic character. This was the result of great study, and, as it is now given, is the reconstruction of an earlier composition. Other dramatic pieces are—the overture, interludes, and melodramatic music in Goethe's *Egmont*, and the instrumental music and choruses in the *Ruins of Athens*.—In the third and last period of B.'s career we find those two gigantic works, the *Missa Solemnis in D Minor*, and the ninth symphony (D minor) with chorus. These works transcend all common laws and forms, and belong to the highest sphere of art. Their deep mysteries can be apprehended only by those who have deep emotions and profound technical knowledge of music. Other works of this last class approach those just mentioned, though they do not reach the same elevation. But all are alike in passing far beyond the ordinary traditional forms of art. All are pervaded by an impulse as of inspiration. Among these works may be mentioned, the great quartets for bow-instruments (mostly published after the death of B.), the grand overtures—works 115 and 124—and several sonatas for pianoforte, especially that in B♭ major.

The life of B. has been written by Schlosser, Schindler, Moscheles, Marx, Nohl, Thayer (1866–71). See also Nettobohm, *Skizzenbuch B.'s.*

BEETLE, a name popularly applied to many kinds of coleopterous insects. It is never extended to insects of any other order, and it is sometimes used in works on natural history as a common name for all coleopterous insects; but this makes it to include many kinds to which it is not popularly applied, as fire-flies, lady-birds, weevils, cantharides, etc. It is also employed by some authors, in a more restricted sense, as a designation of the insects forming the large tribe *scarabæides;* but the restriction, equally with the extension, is an interference with the popular use of the English word, of which, however, the limits are very uncertain. To frame an article, with strict regard to that popular use, and at the same time to science, would not be easy, nor would it be profitable, as the assemblage of kinds would be not only large, but very miscellaneous. We think it better to refer to the article COLEOPTERA, and to the articles SCARABÆIDÆ, BOMBARDIER BEETLE, STAG BEETLE, BURYING BEETLE, GOLIATH BEETLE, ROSE BEETLE, etc. The name BLACK BEETLE is often given to the Cockroach (q.v.). See also BLAPS.

BEETLE-STONES, the name given by the lapidaries of Edinburgh to hard nodules of clay ironstone, found abundantly in a low cliff, composed of shale, at Newhaven, or strewed upon the beach in that neighborhood. They take a beautiful polish, and have been employed to make letter-weights and other ornamental articles. The name was given in consequence of the supposed origin of the fossil which is of most frequent occurrence as the nucleus of the nodules, which, however, is not a fossil beetle, but a cropolite (q.v.). Some of the nodules contain a fossil fish, and some a fossil of vegetable origin.

BEETLING is a finishing mechanical process applied originally to linen shirting, and afterwards to cotton shirting, in imitation of linen, to give the cloth a hard and wiry

look, by flattening the yarn irregularly in an angled manner. This is done by the rising and falling of upright wooden stampers, placed close together in a row, with their square butts resting on a roller over which the cloth passes under them, doubled in a particular way so as to give the yarn an angled appearance when struck. The stampers are worked by the rotation of a horizontal shaft, acting with tapets, like the cylinder of a barrel-organ.

Linen weft is likewise beetled, but by hand-hammering, on a large flat stone, with a wooden mallet, to soften the yarn for easiness of working it, or "getting it on," in the language of the craft, in weaving. Beetling is likewise a process in flax-dressing, to separate the woody from the flexible fibers of the plant. See FLAX-DRESSING.

BEET-ROOT SUGAR. See SUGAR. The sugar obtained from the beet is similar to cane-sugar, but inferior in sweetening power. Beet-root contains on an average about 10 per cent of saccharine matter (sugar-cane, 18 per cent); of the varieties, the white Slesvig beet is the richest. To obtain the sugar, the roots, after being washed, are first rasped down by machines, so as to tear up the cells. The pulp is then put into bags, and the juice is squeezed out by presses. The juice is next treated with lime or sulphuric acid, to clarify it, and also filtered till no deposit is formed; after which it is boiled in large boilers to concentrate it. When it has attained a certain density (25° Beaumé), it is poured through flannel, and is now a dark-colored syrup, which, in order to yield pure sugar, must be deprived of its coloring-matter and mucilage. This is effected by filtering it through animal charcoal or bone-black. The filtered juice is now treated with lime-water beat up with a little white of egg to a lather, till it is slightly alkaline, and is then further concentrated by boiling in copper pans, care being taken to stir and scum it all the while. When sufficiently concentrated, it is put into vessels, and allowed to stand several days in a warm room to crystallize; the uncrystallized part, or molasses, is then drained off, and what remains is raw sugar. This is still further refined by again dissolving and treating it with albumen and blood. In separating the crystallized from the uncrystallized part, centrifugal machines are now much used. Another improvement is the vacuum-pan, which allows the juice to be boiled down without burning. The molasses drained off from beet-root sugar has a disagreeable taste, and cannot be used for sweetening, like cane molasses.

About the middle of the 18th c., Marggraf, an apothecary in Berlin, drew attention to the sugar contained in beet-root; but Achard, the Prussian chemist, was the first who was tolerably successful in extracting it. Still, as only 2 or 3 per cent of sugar was obtained, the product did not pay the cost, until Napoleon's continental system raised the price of sugar, and gave rise to improved methods of manufacturing it. Even after the fall of Napoleon, protective duties kept alive this manufacture in France; and when numerous improvements of method had raised the percentage of sugar realized to about 5 lbs. from 100 lbs. of beet, it took a fresh start (about 1825) in France and Belgium, was revived in Germany, and spread even to Russia. The falling off of the customs duties on the import of colonial sugar obliged the German governments to impose a small duty on beet sugar, which checked the manufacture for a time; but owing to the protective measures of the Zollverein, the trade soon recovered, and is still brisk. Large quantities are annually imported from the continent of Europe, and are used by our refiners mixed with cane sugar, without which it is not successful, for producing the best qualities of refined or loaf-sugar. The imports into Great Britain from the continent, in 1875, amounted to about 240,000 tons.

BEET-ROOT SUGAR. The production of beet-sugar is an industry entirely of modern growth, taking root first in France during the reign of Napoleon I., and subsequently establishing itself after many difficulties in Belgium, Germany, Austria, Russia, and Holland. The table shows the produce of beet-sugar in these countries in 1876.

France	420,000 tons.
Germany	320,000 "
Austria and Hungary	50,000 "
Russia	250,000 "
Belgium	80,000 "
Holland	30,000 "

The development of this industry in Russia has been very rapid since 1864; but, on the other hand, it has been for some years on the decline in Austria, the produce (chiefly Bohemian) of that country having been as high as 180,000 tons of sugar in 1870. All other countries are as yet of minor importance as beet-growers; but in Sweden, Denmark, England at Lavenham, and California, beet-sugar factories have been established with promising results. Several attempts have been made within the last thirty years to make beet-sugar a profitable manufacture in Ireland, but none have as yet been quite successful. The following figures show how rapidly the beet-sugar manufacture has on the whole prospered. Total produce of all countries:

1853	200,000 tons of sugar.
1863	452,000 "
1867	650,000 "
1876	1,154,200 "

This large annual yield of 1⅛ million tons has been maintained for some years, and forms about one fourth on the sugar now produced from all sources.

An acre of land planted with beet can be made without difficulty to yield at least a ton of sugar, worth from £20 to £24, and there are certain by-products besides. The average percentage composition of the root of the sugar-beet is as follows: Sugar, 10½; fiber, etc., 5; gluten, soluble organic compounds, and ash, 3; water, 81½; But the proportion of sugar varies much—it being greater in small than in large beets, in dry than in moist climates, in light than in heavy soils, in the part of the root under than in that above ground, and when manure has not been directly applied to the crop.

Crystallized sugar, although by far the most valuable, is not the only useful product of beet-root, as the following list of its products will show: (1) Crystallized sugar; (2) exhausted pulp useful for cattle food; (3) coarse spirit obtained by fermenting the uncrystallizable sugar; (4) potash salts. The fibrous portion of the root is sometimes used to mix with other material for making paper.

The distillation of spirits from beet is largely practiced on the continent, and many good judges maintain that it is really a more profitable business than the manufacture of beet-root sugar. In Belgium and Germany the two industries are frequently combined, an arrangement which possesses the advantage that, in a season when the proportion of sugar in the roots is too small to yield more than a bare profit, the manufacturer may ferment the sugar-containing juice. The spirit thus obtained yields a fair return even when the beets contain only from 5 to 6 per cent of sugar. This manufacture has been tried in England with but little success as yet; but there really seems no good reason why both sugar and spirits should not be profitably made from beet either in England, Scotland, or Ireland.

BEFFA'NA, a corruption of *Epiphania* (Epiphany), is the name given in Italy to a singular custom prevailing on Three Kings' Day (see BEAN-KING'S FESTIVAL), or Twelfth Night. According to tradition, the B. was an old woman who, being busy cleaning the house when the three wise men of the east passed by on their way to offer their treasures to the infant Savior, excused herself for not going out to see them on the ground that she would have an opportunity of doing so when they returned. They, however, went home by another way; and the B., not knowing this, has ever since been watching for their return. She is supposed to take a great interest in children, who on Twelfth Night are put earlier to bed, and a stocking of each is hung before the fire. Shortly, the cry "*Ecco la B.*" is raised; and the children, who have not gone to sleep, dart out of bed, and seize their stockings, in which each finds a present bearing some proportion in value to his conduct during the year. If any one has been conspicuously ill behaved, he finds his stocking full of ashes—the method the B. takes of expressing her disapprobation. It was also customary in Italy, on Twelfth Night, to carry an effigy called the B. in procession through the streets amid great rejoicings; but this, which was probably the relic of the celebration of a middle-age "mystery," has fallen greatly into disuse. The word is also used to awe naughty children.

BEF'FROI, or BELFRY, was the name of a tower used in the military sieges of ancient and mediæval times. When a town was to be besieged, a movable tower, as high as the walls, was brought near it; and this tower was the beffroi. Its use is more than once spoken of by Cæsar in his account of his campaigns in Gaul. Froissart describes, with his usual spirit, a B. employed at the siege of the castle of Breteuil in 1356. At the siege of Jerusalem by the crusaders, a B. was carried in pieces, put together just beyond bow-shot, and then pushed on wheels to a proper position. The object of such towers was to cover the approach of troops. Sometimes they were pushed on by pressure, sometimes by capstans and ropes. The highest were on six or eight wheels, and had as many as twelve or fifteen stories or stages; but it was usual to limit the height to three or four stages. They were often covered with raw hides, to protect them from the flames of boiling grease and oil directed against them by the besieged; and there was a hinged draw-bridge at the top, to let down upon the parapet of the wall, to aid in landing. The lower stage frequently had a ram (see BATTERING RAM); while the others were crowded with archers, arbalisters, and slingers; or there were bowmen on all the stages except the top, which had a storming or boarding party. During the wars under Charles I., the royalists made a B. to aid in the besieging of a town or castle in Herefordshire; it was higher than the defense-works, and was provided with loop-holes, a bridge, etc.; but the Roundheads captured it before it could be applied to use. Ducange thinks that the name of belfry (q.v.) given to a bell-tower, was derived from the warlike machine called the beffroi or belfry.

BEG, or BEY, a Turkish title, rather vague in its import, and commonly given to superior military officers, ship-captains, and distinguished foreigners. More strictly, it applies to the governor of a small district, who bears a horse-tail as a sign of his rank. The governor of Tunis has this title.—"Beglerbeg," or, more correctly, Beilerbegi ("lord of lords"), is the title given to the governor of a province who bears three horse-tails as his badge of honor, and has authority over several begs, agas, etc. This superior title belongs to the governors of Rumelia, Anatolia, and Syria.

BEGAS, KARL, court-painter to the king of Prussia, professor and member of the academy of art in Berlin, was b. there in 1794. He had been destined for the law, but

early manifested a love for art, and while at Bonn, received his first lessons in painting from Philippart. In 1811, he proceeded to Paris, and there spent eighteen months in the studio of the celebrated Gros. In 1815, Frederick William III., on the occasion of his visit to Paris, bought a large original painting by B. "Job surrounded by his Friends," and gave him two commissions for different churches in Berlin. This led to his moving thither in 1818, and to his subsequently residing in Italy at the king's expense. On his return to Berlin in 1825, he painted a great many biblical subjects for churches, as well as other pictures. He died 23d Nov., 1854. There are frescoes of colossal size by him in the new church of Sacrow, near Potsdam. He is especially distinguished for the animation and individuality of his portraits, and has painted for the king a gallery of celebrated authors and artists, including Humboldt, Schelling, etc. Several of his *genre* paintings have been rendered familiar by repeated engravings; and his works, in general, are eminent for expression, rich coloring, and a peculiarly clear chiaro oscuro.

BEGGAR, a person who solicits charitable aid from the public at large. The word is supposed to have some connection with the fraternity known as Beghards. See BEGUIN. The actual begging or solicitation of temporal aid became, however, so conspicuous a feature among these mendicant orders, that the term originally applied to their sacred duties seems at a very early period to have acquired its modern vulgar acceptation. There is no class of men who have had their lot and condition so varied by ethnical and social conditions as beggars. In a civilized industrious country, the B., to have any chance of relief, must manage to get it believed, whether it be true or false, that he is on the verge of want, and requires the solicited alms to keep him from starvation. Among oriental nations, on the other hand, beggars have often been a potent class, who may be rather considered as endowed with the privilege of taxing their fellow-creatures, than as objects of compassion. It has sometimes been supposed that a residue of this feeling of superiority characterizes the mental physiology even of the mendicant of civilization, and that, abject as he seems, he considers himself to some extent a privileged person, entitled to support from his fellows, without being amenable to the slavish drudgery by which the working-classes live. In Europe, during the middle ages, those doctrines of Christianity which are intended to teach us to abjure selfishness and worldly-mindedness, were exaggerated into a profession of total abstraction from worldly cares and pursuits. Hence arose the large body of religionists who, as hermits or members of the mendicant orders, lived on the contributions of others. In later times, the mendicant orders became the proudest and the richest of the clergy; but while the chiefs lived in affluence, the practices of the lower adherents fostered throughout Europe a system of mendicancy very inimical to civilization and industrial progress. In Great Britain its evil results have been long felt, in the inveterate establishment of practices naturally out of harmony with the independent, industrious character of the British people. Ever since the reformation, the British laws have had a death-struggle with the B.; but neither by the kindness of a liberal poor-law, nor by the severity of a merciless criminal code, have they been able to suppress him. When a country provides, as Britain does, that no one shall be permitted to starve, it would naturally be expected that the springs of miscellaneous charity would be dried. But it is not so, and it is indeed often plausibly urged, that entirely to supersede all acts of kindly generosity between man and man, through rigid legal provisions, must lower the standard of human character, by depriving it of all opportunity for the exercise of the generous emotions. It is clear that, in the light of political economy, promiscuous charity is the most costly and most corrupting way of administering relief to indigence. No one will maintain that the idle B. on the street deserves such a luxurious table as the industrious mechanic cannot afford to himself. But, at the same time, no one who drops a coin in a beggar's hat can say how many others may be deposited there during the day, and whether the B. is merely drawing a wretched pittance, or deriving a good income. Begging being a trade, it is not always those who are the poorest, but those who are the most expert, who will practice it to the best results. The great object is to seize on and appropriate any characteristic calculated, whether permanently or temporarily, to excite compassion. Hence periods of general distress are often the harvest of the B., and his trade rises and falls in an inverse ratio with that of the working community. Times of prosperity are not favorable to him, because he is then told that there is plenty of work for him. But when workmen are dismissed in thousands, and their families turned on the road to seek alms, the professional beggars, by their superior skill and experience, will be sure to draw the prizes in the distribution. Many surprising statements have been made of the large incomes made by skillful professional beggars, especially in London. The most remarkable anecdotes on the subject will be found in Grose's *Olio*, whence they have often been repeated. Attempts have been made, but with questionable success, to set forth an average statement of the earnings in different departments of the B. trade. A good deal of information of this kind will be found in the *Report of the Constabulary Force Commission of* 1839 (see p. 60, et seq.). It does not appear, however, that this trade is, like others, dependent on the law of supply and demand. The B. generally is so constitutionally, whether from hereditary or other physical causes. He has a loathing, even to horror, of steady systematic labor, and he will rather

submit to all the hardships and privations of the wanderer's lot, than endure this dreaded evil.

BEGGARS, THE LAW OF ENGLAND RELATING TO, is regulated by the 5 Geo. IV. c. 83 (amended in regard to other points by the 1 and 2 Vict. c. 38). By the third section of the 5 Geo. IV. it is enacted that every person wandering abroad, or placing him or herself in any public place, street, highway, court, or passage, to beg or gather alms, or causing or procuring, or encouraging any child or children so to do, shall be deemed *an idle and disorderly person;* and it shall be lawful for any justice of the peace to commit such offender to the house of correction, there to be kept for any time not exceeding one calendar month. And by section 4, it is further provided that any person so convicted, and offending in the same way again, shall be deemed *a rogue and a vagabond*, and may be punished by being committed to the house of correction for three months, with hard labor; and by the same section, every person wandering abroad and endeavoring, by the exposure of wounds or deformities, to obtain or gather alms, and every person going about as a gatherer or collector of alms, or endeavoring to procure charitable contributions of any nature or kind under any false or fraudulent pretense, shall be deemed *a rogue and vagabond*, and be punishable as before mentioned. By section 15, however, of the same act, the visiting justices of any county jail, house of correction, or other prison, may grant certificates to persons discharged, to receive alms on their route to their places of settlement; but if such persons shall act in a manner contrary to the directions or provisions of their certificates, or shall loiter upon their route, or shall deviate therefrom, they shall be deemed rogues and vagabonds, and punished accordingly. Other later statutes, however, enable justices to give aid to all prisoners on being discharged from prison, and supersede this doubtful license to beg on their way home. Many prisoners' aid societies are established in different parts of the country, and if their rules are good, they receive a certificate from the visiting justices of jails. When the time arrives for the discharge of a prisoner, the justices have power, out of the moneys under their control, to order a payment of £2, either to the prisoner, or the treasurer of the aid society, for his benefit; and they may also pay his railway fare, so that by this means he can always reach his home without begging.

The attempt or purpose to obtain money or alms by means of shows or entertainments on the streets of London, is also an offense under the metropolitan police act, 2 and 3 Vict. c. 47, s. 54 (No. 14), and punishable by a fine of 40 shillings.

In the Scotch law, there are many severe statutes of the Scotch parliament against beggars and vagabonds, all of which, along with the proclamations of the Scotch privy council on the same subject, are renewed and ratified by the act 1698, c. 21, which forms the existing Scotch law in regard to beggars. The Scotch poor-law amendment act, 8 and 9 Vict. c. 83, contains no provision on the subject. Anciently, in Scotland, legal permission to beg was given to certain sick and infirm poor persons, and in the reign of James V., a system of *tokens* for the same purpose was established.—See Burns' *Justice of the Peace*, vol. vi.; Charnock's *Police Guide*, Dunlop's *Parochial Law of Scotland*, Lorimer's *Hand-book of the Scotch Law*, and the works and authorities referred to in these publications.

BEGGAR-MY-NEIGHBOR, a game at cards usually played by two persons, between whom the cards are divided. Holding their cards with the backs upwards, the players lay down a card alternately, until an honor is played, which is paid for by the adversary —four cards for an ace, three for a king, two for a queen, and one for a knave; such payment being made, the winner lifts the trick. If, however, an honor should be laid down during the payment, then the opposite party must pay for that in the same way; and so on, till a payment is made without an honor. The game is played chiefly by children.

BEGHARDS. See BEGUINES, *ante*.

BEGHAR'MI, or BAGIR'MI, a country in Central Africa, bounded on the n. by lake Tsad; on the w. by the Shari, or Great river, which divides it from the kingdom of Bornou; and on the e. by the Waday kingdom. It extends southward to about lat. 10° north. Its greatest length is about 240 m., and its breadth 150. The whole of B. proper is flat, with a slight inclination towards the n.—its general elevation being about 1000 ft. above the level of the sea. The outlying provinces in the s.e. are slightly mountainous. B. has three considerable rivers flowing through and along its borders—the Bénuwé, Logan, and Shari; the last of which, augmented by the Logan, is upwards of 600 yards across at Mele. There is, in general, however, the utmost scarcity of water in the country, and the inhabitants guard their wells with jealous care. The soil is partly composed of sand, and partly of lime, and produces the grain and fruit common to countries of Central Africa. Worms and ants are very destructive to the crops. The ants appear to be a perfect pest. Dr. Barth describes them as eating through his matting and carpeting, and he had the utmost difficulty in preserving his goods from entire destruction by them. The total population is about a million and a half. From the numerous deserted villages with which the traveler constantly meets, the population would appear to have been much greater at one time. Mohammedanism has been introduced among them, but many are still pagans, and all are grossly superstitious. The only industrial arts are weaving and dyeing. Physically, they are a fine race of people,

superior to the tribes around them, the women being especially handsome. The men are subject to a peculiar disease in the little toe, called "mukárdam." It seems to be caused by a worm, which eats the toe away. One in ten of the male population are said to have lost their little toes through this cause. The sultan is absolute in his own dominions, and several smaller states are tributary to him; and he, in his turn, is tributary to the more powerful ruler of Bornou. The fighting-force of the kingdom is about 13,000 men. Masena (q.v.), the capital, has a circumference of about 7 miles.—Barth's *Travels in Central Africa*.

BEG'KOS, or BEI'KOS, a large village of Anatolia, on the Bosphorus, 8 m. n.n.e. of Scutari, said to be the locality of the contest between Pollux and Amycus, in which the latter was killed. See ARGONAUTS. At the commencement of the Crimean war, the allied fleets anchored in B. bay, prior to their entering the Black sea in Jan., 1854.

BEG'LERBEG. See BEG.

BEGONIA'CEÆ, a natural order of exogenous plants, the place of which in the system is doubtful, but is supposed by Lindley to be near *cucurbitaceæ* (q.v.). The B. are herbaceous or suffruticose plants, with alternate leaves, which are oblique at the base, and have large dry stipules. The flowers are in cymes, unisexual, the perianth colored, with 4 unequal divisions in the male flowers, and 5 or 8 in the female; the stamens are numerous; the fruit is membranous, winged, 3-celled, bursting by slits at the base, the seeds minute.—The order contains about 160 known species, all of which have pink flowers. They are almost all tropical plants, and some of them are often to be seen in British hot-houses; but a small species of *begonia* ascends the Himalaya to at least 11,500 ft., often growing on the trunks of trees. The leaves of the *begonias* have a reddish tinge. The leaves and young stems are succulent and acid, and those of *B. Malabarica, B. tuberosa*, and other species, are used as pot-herbs, or in tarts. The juicy stalks of a large species found in Sikkim, at an elevation of five or six thousand feet, are mentioned by Dr. Hooker as employed to make a pleasant acid sauce. This, and the small Himalayan species already mentioned, would probably succeed in the climate of Britain. The roots of some are used in their native countries as astringents, and some of the Mexican species are used as drastic purgatives.

BEG-SHEHR', a fresh-water lake of Asia Minor, Karamania, 44 m. s.w. of Koniyeh, presumed to be the ancient *Caralitis*. It is about 20 m. long, and from 5 to 10 m. broad. It contains many islands, and discharges itself by a river of the same name into lake Soglah. On its e. and n. shores are the towns of Begshehr and Kereli, the old *Caralio*, which issued imperial coins, and which is also supposed to have occupied the site of Pamphylia.

BEGTA'SHI, a religious order in the Ottoman empire, which had its origin in the 14th century. The name is believed to be derived from that of a celebrated dervise, Hadji Begtash, to whom also the order appears to owe its institution. The members use secret signs and pass-words as means of recognition, in the same way as is done by the masonic orders, some of them indeed appearing to be identical with those of free-masonry. Although numbering many thousands of influential persons in its ranks, the society does not appear to exercise any material influence in the religion or politics of Turkey.

BE'GUINES, BEGUI'NÆ, or BEGUT'TÆ, the name of the earliest of all lay societies of women united for pious purposes. The reason of their origin is not quite certain, but it is usually attributed—in part, at least—to the disproportion in the numbers of men and women which was occasioned by the crusades. These wars had robbed Christendom of thousands of its most vigorous sons, and left multitudes of widows and maidens, to whom life had henceforth something of a solemn and sorrowful aspect, and who therefore betook themselves, in earnest and affectionate piety, to the charities and duties of religion. The origin of the word is doubtful. The popular tradition of Brabant since the 17th c., that a St. Begga, daughter of Pepin, and sister of St. Gertrude, founded, in 696, the first sisterhood of B. at Namur, has no historical basis. Hallmann has also shown that the supposed oldest document of the B. (1065), giving an account of their establishment at Vilvorde, near Brussels, is unauthentic. The most probable account is, that a priest named Lambert le Bègue, or Le Bèghe, i.e., the stammerer, about the year 1180, founded, in Liege, a society of pious women, who were called by his name. The B. were not restricted by vows, nor did they follow the rules of any order, but were united under a *supérieure* for the exercise of piety and benevolence, and lived generally in separate small cottages, which, collectively, formed the *beginagium*, or "*vineyard*," as it was scripturally termed. Their establishments were often enriched by liberal donations. A church, a hospital, and a house of reception or common entertainment, generally belonged to every community of beguines. The sisters were distinguished from the rest of the laity only by their diligence and devotedness, piety, modesty, and zeal for the purity of youthful education. Societies of B. flourished greatly during the 12th and 13th c., when they spread themselves over France and Germany. Among the most important were those in Hamburg, Lübeck, Regensburg, Magdeburg, Leipsic, Goslar, Rochlitz, and Görlitz. As the pietists of the middle ages, the B. were often subjected to persecution by the mendicant orders of friars; but, on account of their practical usefulness,

were sheltered by the pope and councils as well as by secular authorities. In the 13th and 14th c., the B. became united with the persecuted spiritualists among the Franciscans (*fratricelles*), and with the sect of the "brethren and sisters of the free spirit." Hence arose certain heresies, which, of course, occasioned interference on the part of the inquisition; and on account of certain immoralities, a synod held at Fritzlar required that all candidates must be 40 years old before they could enter a society of beguines. These sisterhoods maintained their position in Germany and the Netherlands longer than in other countries. In Holland, they existed at the close of the 18th c.; and in the present day we find here and there so-called *Beguinen-häuser* (beguin-houses) in Germany; but they are now nothing more than almshouses for poor spinsters. At Ghent, there is still a celebrated institution of B., numbering as many as 600 sisters, besides 200 *locatrices*, or occasional inmates. Their houses form a kind of distinct little town, called the Béguinage, which, though environed by a wall, is open to the visits of strangers. Living here a life of retirement and piety, the B., in their simple dark dresses, go out as nurses to the hospital, and perform other acts of kindness among the poor. As above stated, they are under no monastic vow, but having attached themselves to the sisterhood, it is their boast that none is known to have quitted it. There are houses of B. also at Antwerp, Mechlin, and Bruges; and in 1854, one was established in France, at Castelnaudary, in the department of Aude.

BEGHARDS (Ger. *begehren*, to seek with importunity). Societies of laymen styling themselves *B.*, first appeared in Germany, the Netherlands, and the s. of France in the beginning of the 13th c., and were known in Italy as *bizachi* and *bocasoti;* but they never obtained the reputation enjoyed by the beguine sisterhood. Towards the end of the 13th c., they were commonly stigmatized as *bons garçons, boni pueri,* "ministers' men," "bedesmen," "pietists," "vagabonds"—contemptuous titles, which expressed the low estimation in which they were held. On account of heretics of all sorts retreating into these half-spiritual communities, they were subjected to severe persecutions after 1367, and were gradually dispersed, or joined the orders of Dominicans and Franciscans. In the Netherlands, where they had preserved a better character than elsewhere, they maintained their ground longer, and were protected by pope Innocent IV. (1245), in Brussels by cardinal Hugo (1254), and in Liege by pope Urban IV. (1261); but their communities disappeared in the 14th century.—See Mosheim, *De Beghardis et Beguinabus* (Leip. 1790), and Hallmann's *Geschichte des Ursprungs der Belg. Beghinen* (History of the Origin of Beguines in Belgium), Berlin, 1843.

BEGUM, the feminine of "Beg," meaning "lord" or "prince," bestowed upon sultanas and East Indian princesses.

BEHAIM, MARTIN, a famous cosmographer, descended from a Bohemian family which settled in Nuremberg after the middle of the 13th c., and still flourishes there. Behaim was b. in Nuremberg in 1430 (or, more probably, in 1436). He early entered into mercantile life, and went to Venice (1457), and to Mechlin, Antwerp, and Vienna (1477–79), in pursuit of trade. In 1480, he was induced to go to Portugal, where he soon acquired a reputation as a skillful maker of maps. From 1484 to 1485, he accompanied the Portuguese navigator, Diego Cam, in a voyage of discovery along the w. coast of Africa, and sailed as far as the mouth of the Zaire or Congo river, in lat. 22° s., which was 19½° further than had ever been previously reached. In 1486, Behaim sailed to Fayal, one of the Azore islands, where a Flemish colony had settled. Here he married the daughter of Jobst von Küster, governor of the colony. In 1490, he left Fayal, and returned to his native city, Nuremberg, where he resided from 1491 to 1493. During this stay, he constructed a large globe, principally from the writings of Ptolemy, Pliny, Strabo, Marco Polo, and Sir John Mandeville. It is still preserved by the family of Behaim, in Nuremberg, and is a valuable record of the progress of discovery, though it indicates that Behaim's geographical knowledge did not at that period extend beyond Japan on the e., and the Cape Verd islands on the west. After traveling through Flanders and France, Behaim again resided in Fayal from 1494 to 1506, and then removed to Lisbon, where he died, July 29, 1509. The services rendered by Behaim to geographical discovery and the science of navigation were considerable, though, according to the latest investigations, there is no support for the theory that Behaim was the discoverer of America, or even that Columbus and Magelhaen were indebted to Behaim for guidance with regard to their discoveries. Behaim left no works behind him except his maps and charts.—Murr's *Diplomatische Geschichte des Ritters von B.* (1778–1801); A. von Humboldt's *Examen Critique de l'Histoire de la Géog. du Nouveau Continent* (1836).

BEHAR. See BAHAR.

BEHEADING. See CAPITAL PUNISHMENT.

BE'HEMOTH, a large animal mentioned in the book of Job. Scholars are undecided whether it means the elephant, rhinoceros, hippopotamus, or crocodile; but as the animal was both of land and water, and fed upon grass, a number believe the hippopotamus was meant.

BEHISTUN', or BISUTUN' (Lat. *Bagistanus;* Persian, *Baghistan*, place of gardens), a ruined town of the Persian province of Irak-Ajemi, 21 m. e. of Kirmanshah, lat. 34° 18′ n., long. 47° 30′ e. B. is chiefly celebrated for a remarkable mountain, which on one side

rises almost perpendicularly to the height of 1700 ft., and which was in ancient times sacred to Jupiter or to Ormuzd. According to Diodorus, Semiramis, on her march from Babylon to Ecbatana, in Media Magna, encamped near this rock, and having cut away and polished the lower part of it, had her own likeness and those of a hundred of her guards engraved on it. She further, according to the same historian, caused the following inscription in Assyrian letters to be cut in the rock: "Semiramis having piled up one upon the other the trapping of the beasts of burden which accompanied her, ascended by these means from the plain to the top of the rock." No trace of these inscriptions is now to be found, and sir Henry Rawlinson accounts for their absence by the supposition that they were destroyed "by Khusraú Parvíz when he was preparing to form of this long scarped surface the back wall of his palace." Diodorus also mentions that Alexander the great, on his way to Ecbatana from Susa, visited Behistun. But the rock is especially interesting from its cuneiform inscriptions (q.v.), which within recent years have been successfully deciphered by sir H. Rawlinson. The principal inscription of B., executed by the command of Darius, is on the n. extremity of the rock, at an elevation of 300 ft. from the ground, where it could not have been engraved without the aid of scaffolding, and can now only be reached by the adventurous antiquary at considerable risk to his life. The labor of polishing the face of the rock, so as to fit it to receive the inscriptions, must have been very great. In places where the stone was defective, pieces were fitted in and fastened with molten lead with such extreme nicety, that only a careful scrutiny can detect the artifice. "But the real wonder of the work," says sir H. Rawlinson, "consists in the inscriptions. For extent, for beauty of execution, for uniformity and correctness, they are perhaps unequaled in the world. After the engraving of the rock had been accomplished, a coating of silicious varnish had been laid on, to give a clearness of outline to each individual letter, and to protect the surface against the action of the elements. This varnish is of infinitely greater hardness than the limestone rock beneath it." Washed down in some places by the rain of twenty-three centuries, it lies in consistent flakes like thin layers of lava on the foot-ledge; in others, where time has honey-combed the rock beneath, it adheres to the broken surface, still showing with sufficient distinctness the forms of the characters. The inscriptions—which are in three forms of cuneiform writing, Persian, Babylonian, and Medean—set forth the hereditary right of Darius to the throne of Persia, tracing his genealogy, through eight generations, up to Achæmenes; they then enumerate the provinces of his empire, and recount his triumphs over the various rebels who rose against him during the first four years of his reign. The monarch himself is represented on the tablet with a bow in hand, and his foot upon the prostrate figure of a man, while nine rebels, chained together by the neck, stand humbly before him; behind him are two of his own warriors, and above him, another figure. The Persian inscriptions which sir H. Rawlinson has translated are contained in the five main columns numbered 1, 2, 3, 4, 5. The first column contains 19 paragraphs and 96 lines. Each paragraph after the first, which commences, "I am Darius the Great King," begins with, "Says Darius the King." The second column has the same number of lines in 16 paragraphs; the third, 92 lines and 14 paragraphs; the fourth has also 92 lines and 18 paragraphs; and the fifth, which appears to be a supplementary column, 35 lines. With the exception of the first paragraph on the first column, all begin with, "Says Darius the King." The second, fourth, and fifth columns are much injured. Sir H. Rawlinson fixes the epoch of the sculpture at 516–515 B.C. See *Journal of Asiatic Society*, vol. x.

BEHME, JACOB. See BÖHME.

BEHN, APHARA, or APHRA, a licentious authoress of the reign of Charles II., the date of whose birth is unknown, was the daughter of Mr. Johnson of Canterbury, a gentleman who, through his aristocratic connections, obtained the appointment of governor of Surinam. He died on his passage out, but the daughter pursued her journey, and resided at Surinam for some considerable time. Here she made the acquaintance of the celebrated slave Oronoko, who afterwards became the subject of one of her novels, and of a tragedy by Southern. Returning to England, she married Mr. Behn, a merchant of Dutch extraction, was presented at court, where her personal appearance and vivacious freedom of manners pleased the "merry monarch," who deputed her to watch events in Flanders. She accordingly went to Antwerp, where she succeeded in discovering the intention of the Dutch to sail up the Thames and Medway, and communicated the secret to the English court; which, however, took no notice of the information, a slight which caused the fair agent to throw up state politics in disgust. On her return to England, she became intimate with all the profligate wits as well as the more staid scholars and poets of the time, and devoted herself to literature. Her numerous plays, poems, tales, letters, etc., are disfigured alike by general impurity of tone and indecency of language; and, in point of intellectual ability, none of her works deserves the high praise lavished on them by Dryden, Cotton, Southern, and others. She died in 1689. Her works were reprinted in 4 vols. 1872.

BEHRING, or **BERING**, VITUS, a famous navigator, b. in 1680 at Horsens in Denmark. In 1704, he entered as captain in the newly-formed navy of Peter the great. From the ability and daring he displayed in the wars with Sweden, he was appointed to conduct an expedition of discovery in the sea of Kamtchatka. Sailing, in 1728, from a port

on the e. of Kamtchatka, he followed the coast northward until he believed, from the westward trending of the land, that he had reached the n.e. point of Asia. It is now, however, believed that the cape which B. rounded was to the s. of the real East cape (in lat. 66°), and that he never actually reached the strait to which he has given his name. After some years spent in explorations on the coasts of Kamtchatka, Okhotsk, and the n. of Siberia, he sailed in 1741 from Okhotsk towards the American continent, and sighting land about 58½° n. lat., he followed the coast northward for some distance; but sickness and storms obliged him to return, and being wrecked on the desert island of Awatska, since called Behring's island, he died there, 8th Dec., 1741. The previous year, he had founded the present settlement of Petropaulovski, in the bay of Awatska.

BEHRING ISLAND, the most westerly of the Aleutian group, in the n. Pacific, 55° 22′ n., 166° e.; the place where the navigator, Behring, was wrecked in 1741. It is rocky and desolate; pop. about 2500, composed of natives and seal fishers.

BEHRING SEA, the sea of Kamtchatka, the extreme n. part of the Pacific ocean; connected by B. straits with the Arctic ocean; extends s. to the Aleutian islands, and from Alaska to the shores of Asia.

BEHRING'S STRAIT separates Asia from America, and connects the Pacific with the Arctic ocean. The proof that the two continents were not connected was given by the voyage of a Cossack named Deschnew, who, in 1648, sailed from a harbor in Siberia, in the Polar ocean, into the sea of Kamtchatka. But the whole voyage was long regarded by Europeans as a fable, until Behring's (q.v.) expedition in 1728. The strait has since been explored by Cook and Beechy. The narrowest part is near 66° lat., between East cape in Asia, and cape Prince of Wales in America. The distance between the two capes, in a direction from n.w. to s.e., is nearly 50 m.; about midway are 3 uninhabited islands. The greatest depth, some 30 fathoms, is towards the middle, and the water is shallower towards the American coast than the Asiatic. A very old Japanese map in the British museum shows the leading features of this strait very accurately.—BEHRING'S SEA, a part of the n. Pacific ocean, commonly known as the sea of Kamtchatka, bounded w. by Kamtchatka, e. by Alaska, s. by the Aleutian islands, and n. by Behring's strait. There are several islands in this sea, and fogs prevail constantly; but owing to the shallowness of the strait, there are no icebergs of magnitude to be met with.—BEHRING'S ISLAND, the most westerly of the Aleutian islands in lat. 55° 22′ n., long. 166° e. It has an area of 30 sq.m., and is noteworthy as the place where Behring, the discoverer, was wrecked and died in 1741.

BEILAN', a pass and t. in the northern extremity of Syria, on the e. shore of the gulf of Iscanderoon. The pass of B. runs from s.w. to n.e., between the mountain ranges of Rhosus and Amanus, and is the common route from Cilicia into Syria. It is one of the two Amanian passes, supposed to be the lower one, mentioned by Cicero as capable of easy defense on account of their narrowness. There seems to be no doubt that, in the war between Darius and Alexander, the Beilan pass was an important consideration to both commanders, but historians and geographers appear to be at variance as to the precise advantage taken of it in the struggle. The town of B. is situated near the summit level of the pass, at an elevation of 1584 feet above the Mediterranean sea. It has a population of about 5000, many of whom are wealthy, and is much esteemed for its salubrity and fine water, which is supplied by numerous aqueducts. Between the north-western foot of the pass and the sea, are caves and springs, supposed to be the site of the ancient Myriandrus. B. was the scene of a battle between the Egyptians and Turks in 1832, when the latter were defeated.

BEIRA, a Portuguese province, bounded n. by the provinces of Minho and Tras-os-Montes; s. by Estremadura and Alemtejo; e. by Spain; and w. by the Atlantic ocean. It has an area of about 9222 sq.m., and a pop. '74, of 1,390,092. The surface is mountainous, and the soil on the plains sandy, and generally far from fertile. The mountain slopes afford good pasturage for sheep and cattle. The products are corn, wine, oil, flax, and various kinds of fruit, and considerable attention is paid to the rearing of bees. Sea-salt is obtained at the coast. The river Douro waters the whole of its northern, and the Tagus, a portion of its southern, boundary. The Mondego and Vouga flow through its center. Iron, coal, and marble are wrought in small quantity. There is little done in manufactures. The inhabitants are an industrious race of people. In 1835, the province was divided into upper and lower Beira, the former having Viseu and the latter Castel Branco, for its capital.

BEIRAM, or BAIRAM, a Mohammedan festival somewhat analogous to Easter. It commences immediately after the fast of ramadan, or ramazan, which corresponds to Lent. Being one of the only two feasts the Moslems have in the year, it is looked forward to with great interest, the zest being enhanced by the previous abstinence. Its advent is announced at Constantinople by the discharge of artillery, the beating of drums, and blowing of trumpets. Properly, it should terminate in one day, but the Moslems in the capital think it no offense to their abstemious prophet to carry the festivities over two days; while in other parts of Turkey and Persia, they are often protracted for a week or more. Dances, music, processions, etc., in which the women are permitted greater indulgence than usual, form prominent features of the feast; and at

this time the different orders of the empire pay homage to the sultan. Seventy days after, the Moslems celebrate their only other feast ("the festival of the sacrifices"), called the *lesser* B., which is the day appointed by the Mecca pilgrims for slaying the victims, and was instituted in commemoration of the offering up of Isaac by Abraham. The lesser B. usually lasts three days, but it is not celebrated with anything like the pomp of the other. During the continuance of each of the festivals, only one religious service takes place. The Mohammedan year being the lunar one of 354 days, in the course of 33 years the festivals run through all the seasons:

BEISSEL, JOHANN CONRAD, 1690–1768; a German who emigrated to Pennsylvania in 1720 and established at Ephratah the religious community of seventh-day Baptists, or Dunkers. He wrote a number of books upon religious subjects.

BEIT is an Arabic word, signifying house, abode, or place, the equivalent of which in Hebrew is *beth*. Thus, in the former language, we have *beit-al-harâm*, "the house of the sanctuary," or "the sacred house;" and in the latter, *Beth-el*, "house of God;" *Beth-any*, "place of dates;" *Beth-abara*, "place of fords," etc.

BEIT-EL-FA'KIH (house of the saint), a t. of Tehama, on the Red sea. Being the frontier town of the Egyptian government, it has a considerable trade in coffee, wax, gum, etc., which articles are exchanged for Indian piece goods and British shawls. It has a pop. of about 8000, and a citadel of some strength. The houses are built partly of mud and partly of brick, and roofed with branches of the date-tree. It is described by travelers as the hottest town in Tehama.

BEITUL'LAH (Arab., house of God), the spacious building or temple at Mecca, which contains the Kaaba. See MECCA and KAABA.

BE'JA (the *Pax Julia* of the ancients), a t. in the province of Alemtejo, Portugal, 36 m. s.s.w. of Evora, with a pop. of 6500. It is fortified, its walls being flanked by 40 towers, has a castle and a cathedral, and manufactories of leather and earthenware.

BE'JAN, or BA'JAN, the name of the first or "freshman" class in some at least of the Scotch, and of old in many continental universities. The word is believed to be derived from the French *bec-jaune*, or yellow neb, a term used to designate a nestling or unfledged bird. The levying of *bejaunia*, or payments for "first-footing" by students on entering college, was forbidden by the statutes of the university of Orleans in 1365, and of the university of Toulouse in 1401. The election of an *Abbas Bejanorum*, or "Abbot of the Greenhorns," was prohibited by the statutes of the university of Paris in 1493. In the university of Vienna, the *bejan* was called *beanus*, a word of the same meaning, and no doubt of the same origin.

BEJAPUR', a decayed city in the presidency of Bombay, lat. 16° 50′ n., and long. 75° 48′ e. It is situated to the s.e. of Bombay, Poonah, and Satara, at the respective distances of 245, 170, and 130 m., being on an affluent of the Kistna or Krishna, which flows into the bay of Bengal, and nearly touching the w. border of the Nizam's territories. B. was for centuries the flourishing capital of a powerful kingdom, falling therewith under various dynasties in succession, Hindu and Mussulman, till, in 1686, it was captured by Aurungzebe. Thus stripped of its independence, B. speedily sank into the shadow of a mighty name, passing, during the early part of the 18th c., into the hands of the Mahrattas. On the overthrow of the Peishwa, in 1818, it was assigned by the British to the dependent rajah of Satara; but resumed on the extinction of the reigning family in 1848. Now that a gradual decay has done its work, B. presents a contrast perhaps unequaled in the world. Lofty walls, of hewn stone, still entire, inclose the silent and desolate fragments of a city which is said to have contained 100,000 dwellings. With the exception of an ancient temple, the sole relic of aboriginal domination, the ruins are Mohammedan, and consist of beautiful mosques, colossal tombs, and a fort of more than 6 m. in circuit, with an inner citadel. An additional wonder of the place is, perhaps, the largest piece of brass ordnance in existence, cast at Ahmednuggur, where the mold may still be seen. Latterly, the rajah of Satara and the British government have done everything to prevent further decay. Pop. '72, 13,245.

BEJAR, a fortified t. of Spain, in the province of Salamanca, and about 45 m. s. of the capital of the province. It has cloth manufactures, and an annual fair at which a considerable cattle trade is transacted. It has warm saline springs, and gives its title to a ducal family who have a palace within its walls. Pop. 10,683.

BEKAA, the Cœle-Syria of the ancients, the "plain of Lebanon" of the Old Testament, and El Bekaa (the Valley) of the natives of Syria, is inclosed between the parallel ranges of Lebanon and Anti-Lebanon, which mountains it divides, and extends about 90 m. from n. to s., its greatest width being about 12 miles. It is the most rich and beautiful plain in Syria; but although the soil is good, and water abundant from the numerous mountain springs, a very small portion of it is cultivated. It is very much frequented by the Arabs, who bring down their young horses in the spring-time to graze on the plain.

BEKE, CHARLES TILSTONE, PH.D., etc., a modern English traveler, was born in London, Oct. 10, 1800; received a commercial education; afterwards studied law in Lincoln's Inn, and devoted a great part of his attention to ancient history, philology,

and ethnography. The results of these studies first appeared in his work, *Origines Biblicæ*, or researches in primeval history, vol. i. Lond. 1834). His (historical and geographical studies of the east led B. to consider the great importance of Abyssinia for intercourse with Central Africa; but his proposals to undertake an exploring journey were declined by the government, and by several learned societies. Supported only by private individuals, he joined in Abyssinia the party led by maj. Harris, and distinguished himself by the exploration of Godshem, and the countries lying to the s., previously almost unknown in Europe. The results of these researches appeared partly in several journals, and in *Abyssinia, a Statement of Facts*, etc. (2d ed., Lond. 1846). Having returned to Europe, he excited the attention of geographers by his publications: the *Essay on the Nile and its Tributaries* (Lond. 1847); *On the Sources of the Nile* (1849); and by his *Mémoire Justificatif en Réhabilitation des Pères Paez et Lobo* (Paris, 1848). In 1851, Dr. and Mrs. B. made a journey to Harran; and undertook in 1865 a fruitless mission to Abyssinia, to obtain the release of the captives. At the commencement of 1874, Dr. B. started for the region at the head of the Red sea, where he claimed (though his views are disputed) to have discovered Mt. Sinai e. of the gulf of Akabah, and not w. as generally supposed. He died in July of the same year, being engaged at the time on an account of his journey to Sinai. He had enjoyed a civil list pension since 1870.

BEKES, or BEKESVAR, a t. of Hungary, capital of the co. of the same name, and situated at the confluence of the Black and White Körös. Pop. '69, 22,547, who do a trade in cattle, corn, and honey.

BEKKER, BALTHAZAR, 1634–98; a Dutch divine, author of several works in philosophy and theology, the most celebrated being *The World Bewitched*, in which he critically examines the phenomena ascribed to the agency of spirits, and exposes many of the absurdities about Satan that had become articles of religious faith. This book was so offensive to the clergy that B. was deposed from the ministry.

BEKKER, IMMANUEL, a German philologist, distinguished by his recensions of the texts of Greek and Roman classics, was b. in Berlin, 1785; studied in Halle, 1803–07, and was the most eminent pupil of F. A. Wolf. Afterwards, he was engaged at Paris on the *Corpus Inscriptionum Græcarum*. The results of his researches in the libraries of Italy (1817–19) appear in his *Anecdota Græca* (3 vols., Berlin, 1814–21), and his numerous recensions of texts derived solely from MSS., and independently of printed editions. The writers included in these recensions are Plato, the Attic orators, Aristotle, Sextus Empiricus, Thucydides, Theognis, Aristophanes, etc. He became professor at Berlin in 1810, and died in 1871.

BEL. See BAAL, *ante*.

BELA, the name of four Hungarian kings of the family of Arpad.—B. I. (1061–63) energetically suppressed the last attempt to restore heathenism, and by the introduction of a fixed standard of measures, weights and coinage, virtually founded the commerce of Hungary. He was also the first to introduce the representative system into the diet, by appointing, in lieu of the collective nobility, two nobles only from each of the different counties.—B. II., surnamed "the Blind," 1131–41, was entirely under the guidance of his bloodthirsty spouse, Helena, and after her decease, drank himself to death.—B. III., 1174–96. Educated in Constantinople, he introduced Byzantine customs and culture into his own country, which was certainly favorable to its social development, though, on the other hand, his evident devotion to the Greek emperor Emmanuel threatened its political independence.—B. IV., 1235–70, son of that Andreas from whom the nobles extorted the "Golden Bull," Hungary's magna charta. His chief aim was to humble the nobility, and restore the royal power to its former proportions; and he thus roused a spirit of universal discontent, which led to a party among the nobles calling in the Austrian duke, Frederick II., to their aid; but, in the year 1236, he was conquered by B., and forced to pay tribute. Before long, however, the king had to seek a refuge with his discomfited foe; for the Mongols, who invaded Hungary in 1241, defeated him on the Sajo, and put him to flight. It was only after robbing him of all the treasure he had managed to save, and extorting from him three of his counties, that Frederick II. granted the royal fugitive a shelter in Austria, where he remained till the Mongols, having heard of the death of their khan, left the country they had devastated. B. now made it his especial care, by rebuilding the destroyed villages, and inviting new settlers thither, to do away with the tokens of that terrible invasion; and he so far succeeded as to be able, in 1246, to repay Frederick's inhospitality by defeating him at Vienna, and to repulse a second attempt at Mongolian invasion. He died in 1270, his last years having been embittered by an attempt at rebellion on the part of his son Stephen.

BELAI'A, BIELAJA, or BIELA, a river in the department of Orenburg, Russia, emptying into the Kama, after a course of about 600 miles.

BEL AND THE DRAGON, an apocryphal book of the Old Testament. It does not seem to have been accepted as inspired by the Jewish church, nor is there any proof that a Hebrew or Chaldee version of the story ever existed. Jerome considered it a "fable," an opinion in which most modern readers will coincide. It is, nevertheless, read for edification both in the Roman Catholic and Anglo-Catholic churches: in the former, on

Ash Wednesday; in the latter, on the 23d of November. According to Jahn, the aim of the writer was "to warn against the sin of idolatry some of his brethren who had embraced Egyptian superstitions."

BELAYING, one of the many modes of fastening ropes on shipboard. It is effected by winding a rope, generally a part of the running rigging, round a piece of wood called a cleat or a kevel, or else round a belaying-pin, which is an ashen staff from 12 to 16 in. in length.

BELBEYS' (ancient *Bubastis Agria*), a t. of 5000 inhabitants, situated on the e. arm of the Nile, lower Egypt, and 28 m. n.n.e. of Cairo. It is inclosed by earthen ramparts, has numerous mosques, and is one of the stations on the route from Cairo to Suez, and from Egypt to Syria.

BELCHER, Sir EDWARD, a distinguished English naval officer, born in 1799, entered the navy in 1812 as a first-class volunteer, was soon made a midshipman, and in 1816 took part in the bombardment of Algiers. In 1825, B. was appointed assistant-surveyor to the expedition about to explore Behring's strait under capt. Beechey; in 1829, he was raised to the rank of commander. 1836 saw him in command of the *Sulphur*, commissioned to explore the western coasts of America and the Indies. He was absent six years, in which time he had sailed round the world. During this voyage he rendered important services in the Canton river to lord Gough, whose successes over the Chinese were greatly due to B.'s soundings and reconnaissances pushed into the interior. On his return, he published a narrative of the voyage; and in 1843, in consideration of his services, he was made a post-captain, and knighted. After being employed on surveying service in the East Indies, he was, in 1852, appointed to the command of the expedition sent out by government to search for sir John Franklin. B. published *The Last of the Arctic Voyages* (Lond. 1855); *Narrative of a Voyage to the East Indies in* 1843-48; and other works. In 1861, he became rear-admiral of the red, in 1866 vice-admiral, in 1867 K.C.B., and rear-admiral in 1872. He died 18th Mar., 1877.

BELCHER, JONATHAN, 1681-1757; colonial governor of Massachusetts from 1730-1741. He was a native of the colony, and a graduate of Harvard. In 1747, he was governor of the province of New Jersey, where he passed the latter part of his life.

BELCHITÉ, a t. of Spain, in the province of Saragossa, about 22 m. s.s.e. of the city of that name, celebrated as the place where, on June 18, 1809, the French, under Suchet, completely routed the Spanish under gen. Blake, capturing all their guns, 10 in number, with a loss of only 40 men. It has woolen manufactures. Pop. over 3000.

BELED-EL-JEREED, a region of n. Africa between Algeria and the great desert, e. of Morocco. It is noted only for the production of dates.

BELEM,' a t. of Portugal, on the right bank of the Tagus, 2 m. s.w. of Lisbon, of which it may said to form a fashionable suburb. It has an iron foundry, a custom-house, and quarantine establishment, a tower defending the entrance of the river. It is historically interesting as the place from whence Vasco da Gama set sail on his voyage of oriental discovery. It was taken in Nov., 1807, by the French, the royal family of Portugal embarking from its quay for Brazil as they entered. In 1833, it was occupied by Dom Pedro's troops. Pop. 5000.

BELEM', or PARA', a city of Brazil, on the right bank of the Para, the most southerly arm of the estuary of the Amazon. See PARA.

BE'LEMNITES (Gr. *belemnon*, a dart or arrow), an interesting genus of fossil cephalopodous *mollusca*, the type of a family called *belemnitidæ*, to the whole of which the name B. is very generally extended, closely allied to the *sepiadæ*, or cuttle (q.v.) family. No recent species of B. is known: fossil species are very numerous, and are found in all the oolitic and cretaceous strata, from the lowest lias to the upper chalk, some of which are filled with myriads of their remains. These remains are generally those of the shell alone, which is now known to have been an internal shell, entirely included within the body of the animal, like that of the cuttle. The shell, as seen in the most perfect specimens, is double, consisting of a conical chambered portion (the *phragmocone*), inserted into a longer, solid, somewhat conical or tapering, and pointed sheath. The space between the phragmocone and sheath is occupied either with radiating fibers or conical layers. The chambers of the shell are connected by a tube (*siphuncle*), so that the animal probably had the power of ascending and descending rapidly in the water. Its arms are known, from some singularly perfect specimens, to have been furnished with horny hooks; and these it probably fixed upon a fish, and descended with its prey to the bottom, like the hooked calamary (q.v.) of the present seas. Remains of an ink-bag, like that of the cuttle, have been found in the last and largest chambers of the B.; but remains of this chamber, which must have contained all the viscera of the animal, are very rarely preserved, the shell having been very thin at this part. The part most commonly found, and generally known by the name of belemnite, is the solid *mucro*, or point into which the sheath was prolonged behind the chambered shell. These have received such popular names as arrowheads, petrified fingers, specter-candles, picks, thunderstones, etc., from their form, or from the notions entertained of their nature and origin. B. appear to have been of very different sizes; in some of the largest, the mere *mucro* is 10

in. long, and the entire animal, with its arms outstretched, must have been several feet in length

BELFAST, the chief t. of the co. of Antrim and province of Ulster in Ireland. This great seaport stands at the embouchure of the Lagan, at the head of Belfast lough, 12 m. from the Irish sea, 101 n. of Dublin, 36 n.e. of Armagh, 130 s.w. of Glasgow, and 150 n.w. of Liverpool. The site is chiefly on an alluvial deposit not more than 6 ft. above the sea-level, and reclaimed from the marshes of the Lagan. On the land side, it is picturesquely bounded by the ridges of Divis (1567 ft. high), and Cave hill (1185 ft.). The general aspect of B. is indicative of life and prosperity, exhibiting all the trade and manufacture of Glasgow and Manchester, with far less of their smoke and dirt. Many of the streets, especially in the White Linen Hall quarter, are well built and spacious. The mercantile quarter lies chiefly near the extensive and well-built quays. The manufactories are mostly on the rising ground on the n. and w. of the town. Numerous villas sprinkle the northern shores of the bay, as well as the elevated suburb of Malone to the south. The chief public buildings are—Queen's college, a beautiful structure in the Tudor style, opened in 1849, with a revenue of £7000 from the consolidated fund; royal academical institution, incorporated in 1810, affiliated to the London university, and comprising an elementary and collegiate department, and a school of design; museum, Linen hall, commercial and corn exchanges, churches, and banks. The fine botanic gardens of the natural history society occupy 17 acres. B. is the chief seat of the trade and manufactures of Ireland, and is second only to Dublin as an Irish port. The staple manufactures are linen and cotton. The linen manufacture dates from 1637. Cotton-spinning by machinery dates from 1777, and linen from 1806. The other chief branches of industry are linen and cotton weaving, bleaching, dyeing, calico-printing, and iron-founding. There are many flour and oil mills, chemical works, breweries, alabaster and barilla mills, saw-mills, ship-building, rope, and sail-cloth yards. The iron ship-building yard on Queen's island employs upwards of 2000 hands. The inland trade is carried on by the Lagan, the Ulster canal, and three railways. The harbor has recently undergone very extensive improvements, adding 25 acres of area to the dock accommodation, and a mile of quayage, making B. one of the first-class ports of the United Kingdom. Before the recent improvements there were only 2 tidal docks; since 1866, 4 new docks and a tidal basin have been opened. On these a sum of £369,927 was expended, the assets of the commissioners being £938,421. In 1877, 8913 vessels, of an aggregate tonnage of 1,770,685 tons, entered the port; and 5625, of 1,357,021 tons, cleared. The customs duties in 1877 amounted to £488,930. The most important branch of commerce is the channel trade. In 1879, 16 newspapers were published in B. Pop. '21, 37,000; '51, 103,000; '71, 174,412. B. is governed by a corporation of 10 aldermen—one being mayor—and 30 councilors. It returns 2 members to parliament. B. was destroyed by Edward Bruce in the 14th c., but became an important town since 1604, receiving a charter in 1611. In the great civil war, the inhabitants at first joined the parliament, but afterwards became royalists.

BELFAST, a seaport in Waldo co., Me., on Penobscot bay, 30 m. from the ocean, at the terminus of the Belfast division of the Maine Central railroad. There is a good harbor, and some activity in ship-building and fisheries. Pop. '70, 5278.

BELFORT, or BEFORT, a t. of France, capital of the French remnant of the department of Haut-Rhin. From 1870 till 1879 this remnant (234 sq.m.), taking its name from the town, was called the *Territoire de Belfort*, and consisted of those portions of Haut-Rhin which, seized by Germans during the war of 1870–71, were restored to France by the preliminaries of peace arranged at Versailles, 26th Feb., 1871. The strategical importance of B. was recognized by France on its cession by Austria in 1648, and it was fortified by Vauban. At the outbreak of the war between France and Germany in 1870, B. was a fortress of the first rank; and as such maintained, from 3d Dec., 1870, till 16th Feb., 1871, a gallant defense against the German troops. It then capitulated, the defenders being permitted to march out with all the honors of war. B. was also besieged by the allies in 1814. B. has a brisk trade. Pop. '76, 15,103; of territory, '76, 68,600.

BELFRY (Fr. *beffroi*), a word of doubtful origin; a bell-tower, or turret, usually forming part of a church, but sometimes detached from it—as at Evesham and Berkeley, in England, and still more frequently in Italy. See CAMPANILE. Where a church was built in a deep glen, the B. was perched on a neighboring height, as at St. Feve and elsewhere in Cornwall, and at Ardclach and Auldbar in Scotland. At this last place, the bell was hung upon a tree, as was common enough in Scotland at the close of the 17th century. Where the B. consists of a mere turret, it is often called a *bell-gable* or *bell-cote*, and is always placed on the w. end of the church; a smaller one being sometimes placed at the e. end, which is for the sanctus bell, for which reason it is placed over the altar. Municipal belfries are more common on the continent than in this country. When the burghs began to rise into importance after the 12th c., they asserted their rights to have bells to call the burghers together for council or for action. Thus detached belfries arose in the heart of towns. At a later date, they often became part of the *maison de ville*, or town-house, as at Glasgow and Aberdeen, in this country; at St. Quentin and Douai, in France; and at Brussels, in Belgium.

BELFRY, or BEFFROI, a tower of wood, movable on wheels, used in sieges in the middle ages. Sometimes a battering-ram was used with it. It was as high as the wall attacked, and a draw-bridge was rigged at the top to be dropped on the wall when occasion offered.

BELGÆ, the name given by Cæsar to the warlike tribes which in his time occupied that one of the great divisions of Gallia which embraced part of the basin of the Seine, the basin of the Somme, of the Scheldt, of the Maas, and of the Moselle, which itself belongs to the basin of the Rhine. Their country was level, containing no mountains of any height, except the Vosges in the south. The name seems to have originally designated several powerful tribes inhabiting the basin of the Seine, and to have been afterwards used by Cæsar as a general appellation for all the peoples n. of that river. These B. were, in all probability, chiefly of Celtic origin, but within their territories were to be found both pure and mixed Germans.

When s. Britain was invaded by Cæsar, he found that B. from the opposite shores of Gaul had preceded him, and were settled in Kent and Sussex, having driven the aborigines into the interior. The B. in Britain resisted for nearly a century the Roman power, but were finally forced to yield to it. Cæsar regarded them as German, but they rather seem to have belonged to the Celtic portion of the Gallic Belgæ. Certainly, none of the names of their three chief towns are Germanic. Aquæ Solis (Bath) is Latin; Ischalis and Venta (Ilchester and Winchester), British.

BELGARD, a t. in Prussia, 90 m. n.e. from Stettin; has manufactories of tobacco, wool, etc., and a castle; pop. '71, 6303.

BELGAUM', the chief city of a district of the same name in the presidency of Bombay, situated to the e. of the dividing ridge of the West Ghauts, at a height of about 2500 ft. above the sea. Its lat. is 15° 50′ n., and long. 74° 36′ e., its distance to the n.w. of Dharwar being 42 miles. B. possesses a fort, which, in 1818, was taken from the Peishwa by the British. Under its new masters, the place has made considerable progress. It has a superior institution for the education of native youths, which is supported at once by the neighboring princes, the British government, and private individuals. The average annual rain-fall at B. is about 36 inches. In 1848, the citizens spontaneously subscribed a considerable sum for the complete reconstruction of their roads and lanes—a liberality which, besides drawing forth a supplementary grant of public money, roused the emulation of adjacent towns and villages. B. is one of the principal military stations of the presidency, and as such it was, in 1857, the scene of plotting, if not of mutiny, in common with Kolapore, Poonah, Satara, etc. Area of B. district, 4591 sq.m.; pop. '72, 938,750; pop. of town, 26,947.

BELGIC CONFESSION, a statement of faith based on Calvinistic principles, formed by Guido de Bres, of Brabant, and others, about 1561. It was published in the vernacular in 1563, and was received as a symbolical book by the synods of Antwerp and Dort.

BELGIOJO'SO, a t. of Lombardy, n. Italy, pleasantly situated in a fruitful plain between the Po and the Olona, 9 m. e. of Pavia. It has a fine aqueduct and castle, in which Francis I. spent the night previous to the disastrous battle of Pavia, in which he was made prisoner. The Austrian gen. Gyulai made B. his headquarters after his defeat at Magenta, June 4–5, 1859. Pop. 4000.

BEL'GIUM, one of the smaller European states, consists of the southern portion of the former kingdom of the Netherlands (as created by the congress of Vienna).

Geography and Statistics.—Belgium lies between lat. 49° 30′ and 51° 30′ n., and between long. 2° 33′ and 6° 5′ e. It is bounded on the n. by Holland; on the e. by Dutch Limbourg, Luxembourg, and Rhenish Prussia; on the s. and s.w. by France; and on the n.w. by the North sea. Its greatest length, from n.w. to s.e., is 173 English m.; and its greatest breadth, from n. to s., 112 English miles. The whole area is 11,373 sq. miles. The pop. at the census of 1876 was 5,336,185. Beneath are given the provinces, their areas, their pop. in 1873, and their chief towns:

Provinces.	Area in square miles.	Population, Dec. 31, 1873.	Chief cities.
Antwerp	1,094	513,543	Antwerp.
West Flanders	1,250	682,921	Bruges.
East Flanders	1,160	854,366	Ghent.
Hainault	1,436	932,036	Mons.
Liege	1,117	623,165	Liege.
Brabant	1,267	922,468	Brussels.
Limbourg	931	202,922	Hasselt.
Luxembourg	1,705	206,069	Arlon.
Namur	1,413	316,331	Namur.
Total	11,373	5,253,821	

B. is the most densely peopled country in Europe, the pop. being about 462 to the sq.m.; and in the particular provinces of East Flanders, Brabant, Hainault, West Flan-

ders, and Liege, respectively, the proportion is 735, 728, 649, 557, and 555 to the sq. mile. The rural population is to that of the towns as 3 to 1.

Physical Aspect.—B. is, on the whole, a level, and even low-lying country; diversified, however, by hilly districts. In the s.e. a western branch of the Ardennes highlands makes its appearance, separating the basin of the Maas from that of the Moselle, but attains only the moderate elevation of 2000 feet. In Flanders the land becomes so low, that in parts where the natural protection afforded by the downs is deficient, dikes, etc., have been raised to check the encroachments of the sea. In the n.e. part of Antwerp, a naturally unfertile district named the Campine, and composed of marshes and barren heaths, extends in a line parallel with the coast. The once impassable morasses of the *Morini* and the *Menapii*, which stayed the progress of Cæsar's legions, are now drained, and converted into fertile fields, surrounded by dense plantations, which make the land at a distance look like a vast green forest—though, when more closely regarded, we see only numerous dwellings interspersed among fields, canals, and meadows.

Hydrography, Climate, Agriculture, etc.—The abundant water-system of B. is chiefly supplied by the rivers Scheldt and Maas, both of which rise in France, and have their embouchures in Holland. At Antwerp, the Scheldt, which, like the Maas, is navigable all through Belgium, is 32 ft. deep, and about 480 yards wide. Its tributaries are the Lys, Dender, and Rupel. The Maas, or Meuse, receives in its course the waters of the Sambre, the Ourthe, and the Roer. These natural hydrographical advantages are increased by a system of canals which unite Brussels and Louvain with the Rupel, Brussels with Charleroi, Mons with Condé, Ostend with Bruges and Ghent, and this last place with Terneuse. According to the resolution passed by the government in 1842, the long postponed project of cutting canals through the Campine district was at length commenced, and has been very advantageous to the spread of agriculture. A large portion of the Campine seems destined to perpetual barrenness—a dreary, silent, irreclaimable waste; but wherever it has been possible to rescue a patch from the stubborn heath or the relentless sand, there agricultural colonies have been planted, and cornfields shine, and pastures brighten in the heart of the immemorial wilderness. The climate of B., in the plains near the sea, is cool, humid, and somewhat unhealthy; but in the higher s.e. districts, hot summers alternate with very cold winters. April and November are always rainy months. These varieties of climate are favorable to a greater variety of produce than the neighboring country of Holland can supply. The Ardennes districts yield a large supply of wood; while the level provinces raise all kinds of grain—wheat, rye, barley, oats, etc., leguminous plants, hemp, flax, colza, tobacco, hops, dye-plants, and chicory Belgium contains upwards of 7,000,000 acres, of which one half are arable, rather more than one fifth in meadow and pasture, the same in woods and forests, and not above 500,000 acres lying waste. Some hundreds of acres are devoted to vineyards, but the wine produced is of an inferior quality. The forests of Ardennes abound in game and other wild animals. Good pasturage is found on the slopes and in the valleys of the hilly districts, and in the rich meadows of the low provinces. Gardening occupies not less than 130,000 acres; indeed, it has been said that the agriculture of B. is just gardening on a large scale, so carefully and laboriously is every inch of soil cultivated. The spade is still the principal instrument used. In the Campine, the care of bees is very productive, and the cultivation of the silk-worm is encouraged. There are valuable fisheries on the coast, which employ about 200 boats. B. is famous for its horses, and in 1866 contained as many as 283,163 of these animals, 1,242,445 horned cattle, and 686,015 sheep.

Geology.—The geological formations of B. are closely associated with those of France and Britain. The greater portion of the country is covered with *tertiary deposits.* A line drawn across the course of the Scheldt, by Mechlin, along the Demer and Maas, will have on its northern and north-western aspect a tract of tertiary deposits, bounded northwards by the sea. In these tertiary strata the different geological periods are fully represented; but only the second, containing the pleiocene deposits, is rich in fossils. The *secondary deposits* occupy an extensive tract in the center of B., between the Scheldt and the Demer. The most important district, economically, is the south-western, consisting of *palæozoic rocks*—Silurian, Devonian, and carboniferous. These beds have a very complicated structure, from the numerous and extensive flexures and folds they have undergone, and these are often accompanied with great upward shifts, by which beds of many different ages are brought to the same level.

Mineral Products.—B. is rich in minerals, which, next to its abundant agriculture, constitute the chief source of its national prosperity. The four provinces in which they are found are Hainault, Namur, Liege, and Luxemburg. They include lead, copper, zinc, calamine, alum, peat, marble, limestone, slate, iron, and coal. Lead is wrought, but only to a small extent, in Liege; copper in Hainault and Liege; manganese in Liege and Namur; black marble at Dinant; slates at Herbemont; and calamine principally at Liege. But these products are insignificant compared to the superabundance of coal—from anthracite to the richest gas coal—and iron, in which B. ranks next to England. In 1873, B. had 285 coal-mines, employing 107,902 persons, and producing 15,778,401 tons, the total value of which was £13,505,495. In the same year the metallic mines produced about 1,000,000 tons of iron ore, 73,000 of pyrites, 60,000 of calamine, 28,000 of blende, 23,000 of lead, and 450 of manganese. These mines gave employment to

13,122 workmen. In the same year there were 437 iron-works, producing manufactured iron to the value of £10,000,000.

The modern industrial character of the Belgians may be traced back to a very early period, even to the time of the Romans, who noticed the love of traffic prevailing in the Celtic districts of *Gallia Belgica*. This characteristic has remained steadfast to the present time. It is impossible not to recognize in the cloth-weaving *Atrebatæ* the ancestors of the industrious race who gradually extended themselves towards the e. and n. of Belgium. During the early commerce of Europe, when trade was secure only within walled towns, Flanders was the principal seat of productive industry; and its recent separation from Holland has also been indirectly favorable to the development of its internal resources. A state which, like B., begins its career under a burden of debt, which is shut in between nations who possess important ports and colonies, and which is peopled by races not yet sufficiently blended to constitute a perfect nationality, must, before all other things, develop its internal, material resources. This has been well understood in Belgium. Since the commencement of its independent career, it has devoted its attention almost exclusively to those branches of industry and commerce by which its future greatness must be supported.

Manufactures.—The chief manufactures are linen, woolen, cotton, silk, lace, leather, and metals. The great seats of the linen manufacture—recently revived after a long depression—are Courtray and Bruges, in West Flanders; Ghent, in East Flanders; Brussels, in Brabant; Mechlin, or Malines, in Antwerp; and Tournay, in Hainault. The number of linen pieces annually produced is about 900,000. The lawn and damask fabrics of Bruges are celebrated, as well as the lace made in and near Brussels, Malines, Louvain, and Bruges, which sometimes commands a price of £40 per yard. But the Belgian hand-spun yarn, though superior in quality, cannot maintain its ground against machinery. Verviers, Liege, Dolhain, Ypres, Doperinghe, Limburg, Bruges, Mons, Thuin, and Hodimont are centers of the woolen manufacture. Ypres alone employs 50,000 workmen in this branch of industry. Brussels and Tournay have large carpet manufactures, and Hainault supplies a considerable amount of hosiery. The principal manufactures of cotton are at Ghent and Lokeren, in East Flanders; Bruges and Courtray, in West Flanders; Malines, Louvain, and Anderkecht, in Brabant; Tournay and Mons, in Hainault; and also at Antwerp. The separation of B. from Holland had at first a prejudicial effect on this as on other trades; but the opening of the navigation of the Scheldt, the intersection of the country by railways and canals, and, in consequence, the rapid and extensive communication with other countries, have revived the activity of the cotton trade, which now gives employment to between one and two hundred thousand workmen. Maestricht, which belongs to Holland, is one of the chief seats of manufactures of leather; but this trade is also carried on at Limbourg, Liege, Stadelot, Namur, Dinant, and especially at Bruges and Ghent. The manufacture of gloves has made great progress in recent years. Metallurgy also has rapidly increased in productiveness since 1816, when Cockerill introduced into B. the English method of smelting iron with coke. The principal seats of the metal manufacture are Liege, Namur, Charleroi, Mons, and their neighborhoods. There are large ordnance foundries at Liege and Malines, and celebrated makers of fire-arms and machinery in Liege; nail-making at Charleroi; tin-ware, etc., at Liege and in Hainault; wire and brass factories at Namur; zinc manufactures at Liege; lead and shot factories at Ghent: the gold and silver goods of Brussels and Ghent may also be noticed as important branches of Belgian industry. Flax is one of the most extensive and valuable products of B., no fewer than 400,000 persons being employed in its culture and preparation. Besides these, we may mention the straw-bonnet manufacture in the neighborhood of Liege; the paper fabrics of the provinces Liege, Namur, and Brabant; the glass-works of Hainault, Namur, Val-St-Lambert, and Brabant; the porcelain, etc., of Tournay, Brussels, Mons, and Ghent; and sugar-refineries at Antwerp, Bruges, Ostend, Ghent, etc. Steam-engines have been quite familiar objects in the several manufactories of B. for many years.

The natural wealth and industrial resources of B. have always been more or less modified by the political relations of the country. In the middle of the 13th c., B., with Bruges as its chief seat of manufactures, had surpassed all its neighbors in industry, and had established a flourishing commerce with the Italians. After the discovery of America, Antwerp took the place of Bruges, and was regarded as a northern Venice. But the unhappy period of Spanish oppression and the war in the Netherlands deeply depressed Belgian commerce, which suffered still more at the peace of Westphalia, when Holland monopolized the navigation of the Scheldt. The river was again opened at the close of the 18th c., when the French had invaded the Netherlands, and Napoleon caused the harbor of Antwerp to be restored and enlarged. At the cost of Amsterdam, Belgian commerce received a new impulse by the union of B. with Holland, as settled by the congress of Vienna; but scarcely were hopes revived, when the revolution of 1830 changed the prospects of the country. The treaty signed in London, April 19, 1839, gave to Holland the right to levy a toll of two-and-sixpence per ton on all vessels navigating the Scheldt. The privilege of navigation on the inland waters between the Scheldt and the Rhine was purchased by B. for an annual payment of £50,000. In June, 1839, this privilege was virtually taken away by the government of Holland, and, in 1843, with additional expense to B., the new treaty of navigation was ratified by both parties.

During this crisis preceding the development of a free commerce, B. had not neglected her internal resources. The société de commerce de Bruxelles, the banque de Belgique, and other associations for the extension of trade, had been formed; and May 1, 1834, the government adopted the scheme for a railway-system the most complete of any on the continent. The center of the Belgian net-work of railways is Malines, whence lines are carried out in all directions. The n. line goes to Antwerp and its harbor; the w., by Ghent and Bruges, to Ostend; the s.w., by Brussels and Mons, to Quiévrain and the borders of France, not far from Valenciennes; and the e., by Louvain, Tirlemont, Liege, Verviers, and extending to the confines of Prussia. There were in 1874 open for conveyance in B. 2105 m. of railway lines; of these 838 m. were in the hands of the state, and the rest were worked by companies. The cost of the permanent way and buildings of these lines has been about £18,280 a mile. The net revenue at present is stated to be £1508 a mile. The working of the post-office in B. was, in 1874, as follows: Private letters, 58,036,628; official letters, 6,035,861; packets, 30,094,207; newspapers, 58,825,598. On Jan. 1, 1875, there were in that country 479 post-offices, 474 telegraph stations, and the total length of telegraph lines was 3066 m., the length of wires, 12,806 miles. B., along with France, Italy, and Switzerland, entered on a monetary league in 1865, in which the four states agreed to adopt the French decimal system of coins, weights, and measures. In 1873, the imports amounted to £96,992,320, and the exports to £86,556,000. These sums include the value of "goods in transit." Excluding the latter, the value of purely Belgian imports in 1875 was £52,284,120; of exports, £44,072,080. The commercial intercourse of B. with Great Britain, in 1876, amounted to £13,848,293 for exports, and £5,875,407 for imports. Among the principal articles of export are coal, flax, linen, woolen and cotton goods, glass, firearms, and nails More than a third of the whole is consigned to France, and half of the remainder to Germany, England, and Holland. The maritime commerce is chiefly carried on in British ships, the native shipping, which is not increasing, being in 1876 only 59 vessels, of 50,186 tons, with 255 fishing-boats. The unit of the Belgian monetary system is the franc.

The intellectual improvement of B. has not kept equal pace with its material prosperity. The lack of political independence, which has forced the best energies of the country into foreign centers of activity, and the variety and confused mixture of dialects, have retarded the growth of the national intellect, and the formation of national individuality. An independent national literature, acting as the bond of a pure national unanimity, was not possible, under such unfavorable conditions, to which may be added the facilities afforded for supplying the people with cheap reprints of foreign works. The Flemish element—the most important—seems indeed to have become conscious of its capabilities in respect to literature; but a genuine expression of the entire Belgian mind will first become possible when the Walloon element also begins to develop a freer form of speech along with its own peculiar modes of thought. The royal academy of arts and sciences at Brussels is at the head of several other unions for scientific purposes. Among the most celebrated names in Belgian literature and science, may be mentioned—Quetelet in mathematics, Altmeyer the historian, Fetis the musical critic, Conscience the Flemish poet and novelist, Willems the philologist, and Baron and Moke in literary history and criticism. Painting and architecture formerly flourished in the wealthy old towns of Flanders; but after the brilliant epoch of Rubens and his pupils, a long period of dullness followed. In modern times, a revival of art has taken place, as may be proved by the names of the painters, Wappers, De Keyser, Gallait, De Biefve, Verboekhoven, etc.; the sculptors, W. Geefs, Simonis, Jehotte, Fraikin, etc.; the engravers, Calamatta, Brown, and Meunier; and the medalists, Wiener and Hars.

The Belgian school-system suffered for more than ten years under the freedom of teaching allowed by the constitution, which was chiefly made use of by the wealthy Catholic clergy. The consequence was that education assumed a divided and sectarian character. Since the state, however, has exercised a general superintendence over the universities, gymnasia, and elementary schools, a higher style of education has prevailed. The two universities of Ghent and Liege, united with a school of architecture and mining; ten national schools (*Athénées*), in which a classical is combined with a commercial education; upwards of 50 schools preparatory to these (*écoles moyennes*); two seminaries for teachers at Lierre and Nivelle, besides the superintendence now exercised by the state over the institutions formerly maintained by communes and provincial corporations, and, above all, over the primary schools—all this forms a sufficient counterpoise to the numerous schools supported by private individuals and religious bodies. Among the latter may be noticed the Catholic university of Louvain, founded in 1836, and conducted under strict ecclesiastical discipline; the free university of Brussels; and the gymnasia of the Jesuits at Namur, Brugelette, Brussels, and Liege. Journalism in B. has been greatly extended by the abolition of the stamp-duty (1848), and 180 daily newspapers are now published, including 56 Flemish papers; but only a few have obtained a proper degree of respectability and influence.

Population and Religion.—The pop. of B. is of mixed German and Celtic origin. The Flemings (a branch of the Teutonic family) and Walloons (a branch of the Celtic family), distinguished by their peculiar dialects, are still conspicuous among the pure Germans, Dutch, and French. The French language has gained the ascendency in educated society, and in the offices of government; but the Flemish dialect prevails numeri-

cally in the proportion of 4 to 3. The *Catholic religion* is the prevailing form. There are only about 14,000 or 15,000 Protestants, and 3000 Jews. The supreme Catholic dignitaries of B. are the archbishop of Mechlin, and the five diocesan bishops of Bruges, Ghent, Tournay, Namur, and Liege.

The *government* of B. is a limited constitutional monarchy, and was established in its present form by the revolution of 1830. The legislative body consists of two chambers —that of the senate, and that of the representatives. A responsible ministry, with the king as president, is at the head of all public affairs, and its measures are carried into effect by the governors of the several provinces. The ministry includes departments for home affairs, foreign affairs, finance, justice, public works, and war. The administration of justice retains the forms of French jurisprudence. In 1878, the estimated revenue of B. was £10,413,350; and the estimated expenditure, £10,384,230. The national debt amounted in 1878 to 1,521,947,444 francs, or £60,877,897.

The standing army of B. is formed by conscription, to which every healthy man who has passed his nineteenth year is liable. Substitution is allowed. The legal period of service is eight years, but about five years are allowed on furlough. According to a law passed in 1868, the strength of the army is to be 100,000 men on the war footing, and 40,000 in times of peace. The importance of B. in a military point of view affords a reason for the maintenance of fortifications at Antwerp, Ostend, Nieuport, Ypres, Tournay, Mons, and other places.

History of Belgium to 1830.—In the time of the Romans, the name *Gallia Belgica* was given to the southern Netherlands lying on the confines of Gaul and Germany. It was peopled by Celtic and German tribes. The latter were predominant in Batavia and Friesland, and under the rule of the Franks in the 5th and 6th c., gained the ascendency also in the southern districts. Until the close of the 11th c., the feudal system, which arose at the fall of the Carlovingian dynasty, prevailed in the Netherlands, where the several southern provinces were made duchies and counties. The co. of Flanders, superior to all the others in industry and commerce, maintained, during a long struggle, its independence against France; and, in 1385, when the male line of the counts of Flanders expired, was annexed to the powerful house of Burgundy, which, in the beginning of the 15th c., also gained possession of all the other provinces of the Netherlands. The rulers of Burgundy aimed at founding a powerful united state between France and Germany, and therefore endeavored to repress the free republican spirit which manifested itself in the rapidly rising towns. The work of establishing unlimited sovereignty was interrupted by the fall of Charles the bold, and the partial division of his territories; but was continued by the emperor Charles V., the grandson of the emperor Maximilian, and Maria, the heiress of Burgundy—through the latter of whom the Netherlands passed into the possession of the house of Hapsburg. After the abdication of Charles, these provinces passed into the hands of Philip II., and by the law of primogeniture, should have remained united with Spain. But scarcely had the peace of Château-Cambresis (1559) put an end to the encroachments of France, when the religious disputes of the reformation, and the despotic measures of Philip, excited in the provinces a long and bloody war for civil and religious freedom, which ended in the independence of the northern or Teutonic Netherlands, while in the southern or more Celtic provinces (now included under B.), both the sovereignty of Spain and the rule of the Roman Catholic church continued. In 1598, B. was ceded by Philip II. to his daughter Isabella, wife of the archduke Albert, when it became a distinct and independent kingdom. Several measures for the better regulation of internal affairs, especially in the administration of justice, and for the revival of industry, which had been injured by the unenlightened policy of Philip, were projected. Unfortunately, Albert died childless in 1621, and B. fell back into the hands of Spain, and became involved in the wars attending the decline of the Spanish monarchy. Peace was concluded chiefly at the cost of Belgium. By the treaty of the Pyrenees (1659), the counties of Artois, Thionville, and other districts, were given to France. Subsequent conquests by the same powerful neighbor secured to it, at the peace of Aix-la-Chapelle (1668), the possession of Lille, Charleroi, Oudenarde, Courtray, and other places. These were partly restored to B. at the peace of Nimeguen; but as a compensation, Valenciennes, Nieuport, Cambray, St. Omer, Charlemont, and other places, were given up, and only partially regained by B. at the peace of Ryswick in 1697. After the conclusion of this treaty, at the close of the reign of Charles II. of Spain, some endeavors were made to create prosperity in B. by a new system of taxation and customs, and by the construction of canals, to counteract the injury done to its commerce by the closing of the navigation of the Scheldt; but these projected improvements were interrupted by the Spanish war of succession, which was not concluded until the peace of Utrecht, in 1713. By this treaty, B. was given to Austria, Holland retaining the privilege of garrisoning the most important fortresses on the French frontier, and also of exercising a monopoly of the navigation of the Scheldt. The "Belgian commercial company" at Ostend, founded by Charles VI. in 1722, fell in 1731—another sacrifice to the cupidity of Holland. During the Austrian war of succession (1744), almost the whole country fell into the hands of the French; but was peaceably restored to Austria by the treaty of Aix-la-Chapelle (1748).

B. remained undisturbed by the seven years' war, and during the long peace following the treaty of Aix-la-Chapelle, prosperity was restored. Especially during the

mild reign of Maria Theresa of Austria, measures of public improvement were promoted by prince Charles of Lorraine, governor of the Belgian provinces. The reign of Joseph II., son and successor of Maria Theresa, began in disputes with Holland. The latter country consented to the abolition of the *barrière-contract*, in consequence of which, several important fortresses were demolished, though the emperor failed in his endeavor to make free the navigation of the Scheldt. But the errors of his internal administration were the serious feature of his policy. By his innovations, he offended the religious sympathies of the people, and violated the legal privileges of the states, of which he had made the strict preservation a condition of obedience. In a short time, discontent openly manifested itself. The Austrian authorities were attacked; Brabant refused to pay taxes; while the more violent fled into Holland, and organized an armed expedition. Returning, they were joined by numbers of the inhabitants, defeated the foreign troops, captured Brussels, and, in the beginning of 1790, declared their independence. In the course of the year, however, the Austrians succeeded in regaining possession of the country. The privileges of the states as they existed at the close of the reign of Maria Theresa were restored, and at the same time stringent measures were adopted to prevent any renewal of disturbances. But this state of peace was soon interrupted by the outbreak of the war of the French revolution. B. was conquered by Pichegru in the campaign of 1794, and subsequently united to France by the treaties of Campo-Formio and Luneville. It now shared in the fortunes of France during the consulate and the empire; received the *code Napoleon;* and in all political relations was organized as a part of France. After the fall of Napoleon, it was united with Holland, and its boundaries defined by the congress of Vienna (May 31, 1815).

At the introduction of the new constitution, the want of national unity in language, faith, and manners was strikingly manifested by the two great parties—the Dutch Protestant population, with their commercial habits, on the one side, and the Catholic population, of agricultural and manufacturing B., on the other. These natural and unavoidable obstacles to the political harmony of the new kingdom, were further increased by the unfair treatment which B. experienced. All the more important provisions of the constitution had a regard chiefly to the interests of Holland. Repeated attempts were made to supersede the Belgian language by the Dutch in all affairs of administration and jurisprudence, though the former were the more numerous people; the privileges of the Belgian clergy were abridged; the poorer classes were severely taxed; while the government was almost exclusively composed of Dutchmen. In 1830, among seven ministers, there was only *one* Belgian; among 117 functionaries of the ministry of the interior, only 11 Belgians; among 102 subordinates of the ministry at war, only 3 Belgians; and among 1573 officers of infantry, only 274 Belgians. B. was politically divided into two classes —the Liberal and the Catholic. Both of these strongly resented and opposed the encroachments of Holland: the Liberals, from a desire to preserve the national secular institutions; the Catholics, from a desire to preserve the national church. The government became alarmed at their increasing hostility; and ultimately, when their patriotic fusion rendered its position critical, it made several concessions; the supremacy of the Dutch language, and the taxes on the necessaries of life, were abolished. Efforts were also made to conciliate the Catholic priesthood. But these concessions came too late, and were, in consequence, only construed as signs of weakness. In 1828 and 1829, it was attempted to coerce and intimidate the opposition, by prosecuting the liberal or democratic leaders. This only fanned the fire of discontent, which was already burning fiercely in the hearts of the Belgians, and panting for an opportunity to break out into visible insurrection.

From 1830 *to the present time.*—The French revolution of 1830 afforded the desired occasion. On the king's birthday (Aug. 24, 1830), several riots occurred in various towns of Belgium. At this period, however, the idea of separation from Holland does not seem to have presented itself consciously to the Belgian mind; the deputies who were sent to the Hague to state the causes of the general dissatisfaction, merely insisted on its possessing a separate administration, with the redress of particular grievances. But the dilatory and obstructive conduct of the Dutch deputies in the states-general assembly at the Hague on the 13th Sept., exasperated the Belgian nation beyond measure. A new and more resolute insurrection immediately took place. In seven days, the people had deposed the old authorities, and appointed a provisional government. Prince Frederick, the son of the sovereign, who commanded his father's troops, was compelled to retreat from Brussels to Antwerp, having suffered considerable loss. On the 4th Oct. B. was declared independent by the provisional government, composed of Messieurs Rogier, D'Hooghvorst (commandant of the civic guard), Joly, an officer of engineers, and the secretaries Vanderlinden and De Coppin; count Felix de Mérode, Gendebien, Van de Meyer, Nicolai, and De Potter, the democratic leader. They also announced that a sketch of the new constitution was in course of preparation, and that a national congress of 200 deputies would shortly be called together. Freedom of education, of the press, of religious worship, etc., were proclaimed. Here and there, the new liberty showed a tendency to become anarchic; but its excesses were speedily suppressed; and at the national congress of the 10th Nov., out of 187 votes, only 13 were in favor of a democratic government. Meanwhile, the London congress had assembled, and after mature deliberation, recognized the severance of the two kingdoms as a *fait accompli* (Dec.

10). The Belgian congress, on its assembly, appointed baron Surlet de Chokier provisional regent, but on the 9th July elected prince Leopold of Saxe-Coburg king, who entered Brussels on the 21st of the same month, and subscribed the laws of the constitution. This prince proved himself one of the wisest monarchs of modern times. He died in 1865, and was succeeded by his son, Leopold II., the present king of Belgium. Holland refused to acknowledge the validity of the decision of the London congress, and declared war against B., which was speedily terminated by France and England—Holland securing that B. should annually pay 8,400,000 guilders as interest for its share in the national debt of Holland. The latter country, however, was still dissatisfied, and ventured to employ force. England and France were compelled to interfere. The blockade of the coast of Holland brought the Dutch to terms, and the dispute was closed by a treaty signed in London, May 21, 1833.

The monarchy of B. is hereditary, according to the law of primogeniture, but with a perpetual exclusion of females and their descendants. The legislative power is vested in the king and two chambers; and the king has the power to dissolve either the senate or the house of representatives, or both. The number of deputies in 1869 was 116, sent by 41 electoral districts. Electors must be Belgians by birth or naturalization, must have attained 25 years of age, and pay taxes, each to the amount of £1 13*s.* 4*d.* Members of the chamber of representatives require no property qualification. The senate consists of half the number of representatives, and is elected by the same constituency, but for 8 years instead of 4. A senator must be 40 years of age, and must pay at least 1000 florins of direct taxes. The budget is annually voted by the chambers, and the contingent of the army is also subject to their annual vote.

In 1842, a law was carried in both chambers, by which it was enacted that the parishioners should be bound to provide elementary schools, according to the wants of the population, in all places where the want of education was not fully supplied by voluntary means. The main regulations for the universities were effected by the ministry of De Theux, 1835; but the organization of intermediate instruction (that is, between the *ecoles primaries* and the universities) was postponed, as involving some delicate party interests, until 1850; and even then was not concluded in a way satisfactory to the Catholic clergy.

In 1838, it seemed as if Holland and B. were likely to engage in war once more. According to the "twenty-four articles" of the "definitive treaty," B. was under obligation to give up Limburg and a part of Luxemburg during the above-mentioned year. This it now refused to do, and put its army on a war-footing; but its obstinacy finally gave way to the unanimous decision of the five great powers.

After 1840, the opposition of the Catholic to the liberal party became more and more decided. The elections of June 8, 1841, were attended with great excitement, and it was a significant fact that the liberal candidates re-elected were everywhere returned by large majorities, while in the principal towns where Catholics were returned, only small majorities appeared. Meantime, however, commerce progressed under a wise and liberal policy.

In July, 1845, the liberal Van de Weyer, at the head of a new administration, endeavored to confirm the so-called "union" of Catholics and liberals. But he had scarcely asserted the prerogative of the civil power in matters pertaining to the question of education in the "intermediate schools," when he was forsaken by his colleagues, who acted under the influence of the Catholic priesthood. In Mar., 1846, a purely Catholic ministry was formed under the presidency of De Theux. This was an anachronism, for the elections of 1845 had secured a victory for the liberals.

The elections of 1847 at last brought to a close the system of government in subservience to the church. A new liberal ministry was formed by Rogier and others, whose programme of policy promised the maintenance of the independent civil authority in all its subordinate functionaries; a budget favorable to the public with regard to duties on provisions; and measures to promote the interests of agriculture. The institution of numerous agricultural and commercial schools, normal *ateliers*, popular libraries, and other means used for raising the working-classes, were followed by most beneficial results. The revolutionary tempest of 1848, however, menaced the tranquillity of the country; but the king, at the outbreak of the catastrophe in France, promptly declared himself ready to retain or to surrender the crown of B., according to the decision of the people. This frank and ready declaration had a successful result in strengthening the party of order, while it disarmed even those most disaffected to the crown.

In July, 1848, the result of the elections was found to be a great strengthening of the liberal-constitutional party. In Nov., 1849, a new commercial treaty for 10 years was concluded with France, and the duration of the treaty with the German zollverein was lengthened. In 1850, the educational question was supposed to be settled on soundly liberal principles; but since then there has been a keen struggle between the progressists and the ultramontanes. At present the question of liberal advance in education and religion in B. is, as it is in Prussia, France, and Italy, a question of very considerable interest.

BELGOROD (Russian, *Bejelgorod*, "white town"), a t. of (1867) 15,200 inhabitants, in the Russian government of Kursk. It is situated on the Donetz, in lat. 50° 40′ n., long. 36° 35′ east. B., which derives its name from a chalk-hill in the vicinity, is divided into two—the old and the new towns. It is built chiefly of wood, is an archbishop's see, has numerous churches, two monasteries, manufactories of leather, soap, etc., and carries on a considerable trade in wax, bristles, and hemp. Three important fairs are held here during the year.

BELGRADE', the ancient *Singidunum*, styled by the Turks *Darol-Jihad*, the "house of the holy war," and in German, *Weissenburg*, is an important fortified and commercial t., capital of Servia. It is situated at the confluence of the rivers Save and Danube. The name B. is derived from the Slavonic word *bielo*, "white," and *grad* or *grod*, a "fort" or "town." B. contains (1874) 27,605 inhabitants, and is divided into four parts—the fortress, a very strong place, which, situated on the tongue of land between the rivers, commands the Danube; the Water town, also well protected by walls and ditches, on the n.; the Raitzen town on the w.; and the Palanka on the s. and e. of the citadel. B. contains 14 mosques. The prince's palace, the residence of the metropolitan, the national theatre, and the public offices are the principal buildings. Vessels navigating the Danube anchor between the three islands above Belgrade. B. has manufactories of arms, cutlery, saddlery, silk goods, carpets, etc., and is the seat of the chief Servian authorities. It is the entrepôt of the trade between Turkey and Austria. The position of B. has made it the chief point of communication between Constantinople and Vienna, and the key to Hungary on the s.e. It has consequently been the scene of many hard contests. The Greeks held it until 1073, when it was captured by the Hungarian king, Salomon. After this, it passed through the hands of Greeks, Bulgarians, Bosnians, and Servians, and these last proprietors sold it, in the beginning of the 15th c., to the emperor Sigismund. In 1442, it was unsuccessfully besieged by the Turks, with a large and vain outlay of time and money; and when stormed (July 14, 1456), it was retaken from the Turks by the heroism of Hunyades and Capistrano. In 1522, it was carried by the sultan Soliman II. In 1688, it was stormed and taken by Maximilian, elector of Bavaria; but in 1690 was recaptured by the Turks, when the Christian garrison had been reduced to 500 men. In 1693, B. was vainly besieged by the duke of Croy; and in 1717, the citadel surrendered to prince Eugene, after he had defeated an army of 200,000 Turks, with a loss to them of 20,000 men. But in 1739, B. again changed owners, the Turks obtaining it without a shot. In conformity with the treaty then signed, the fortifications were demolished. In 1789, it was again taken by the Austrians under gen. Laudon; but by the treaty of peace, 1791, was restored to the Turks. From 1806 to 1813 it was in the possession of the insurgent Servians; and though on the founding of the principality of Servia, B. was made the capital, the citadel remained in the hands of the Turks till 1867. In that year the porte was constrained by diplomacy to yield up this important possession to the Servian government.

BE'LIAL, or, more accurately, BELI'AL, a Hebrew word, signifying idle, wicked, or unprofitable. The Scripture phrase, therefore, "sons of B.," was originally, in all probability, a mere Hebrew figurative expression denoting worthless or dissolute persons. At a later period, the idea of evil which the word embodies, seems to have been elaborated into a personality, and B. is supposed by some to correspond to the Pluto of the Greeks.

BELIDOR, BERNARD FOREST DE, 1693–1761; a French military engineer, and a member of the academy of sciences; author of works on hydraulic architecture, fortifications, engineering, mathematics for the use of artillery, etc.

BELIEF. This is a word sufficiently intelligible in common speech; but, nevertheless, various subtle problems and protracted controversies have been connected with it. A brief account of the chief of these may be here given.

1. It has been a matter of no small difficulty with mental philosophers, to give an exact rendering of the state of mind so denominated, or to specify the exact import, test, or criterion of the act of believing. It is easy enough to comprehend what is meant by an idea or a notion, as when we speak of having the idea of a rose, its shape, color, odor, etc.; but when we make the further step of affirming our belief in the sweetness of the rose, it is not so easy to describe the exact change that has come over the mind in so doing. In all belief, there must be something intellectual, something thought of, or conceived by the mind; and hence there has been a disposition to recognize the believing function as one of the properties of our *intelligence*. We believe that the sun will rise and the tides flow to-morrow: here are undoubtedly implied intellectual conceptions of the sun, his rising, and of to-morrow; of the sea, its movements, and so on. But the question comes, what is the difference between conceptions believed in as these are, and conceptions quite as clear and intelligible that are not believed? as the notion that the fluctuation of the sea on the shores of Britain is the same as on the shores of Italy. It is not to the purpose to say, that in the one case we have knowledge and evidence, and not in the other; for what is wanted is to define the change that comes over us, when what is a mere notion or supposition passes into a conviction; when a day-dream or hypothesis comes to take rank as truth.

To answer this inquiry, we must bring in a reference to *action;* for although belief connects itself with our intelligence, as now mentioned, it has action for its root and ultimate criterion. Coming up to the edge of a frozen lake, and looking at the thickness of the ice, we believe that it will bear to be trodden on, and accordingly walk across it. The meaning or purport of the believing state here is, that we do not hesitate to trust our safety to the fact believed. The measure of our confidence is the measure of our readiness to act upon our conviction. If the frozen lake lie between us and our destination, we feel elated by the certainty of arriving there, which we should not under a weak or imperfect trust in the goodness of the ice. Belief, therefore, although embodied in ideas, or intellectual conceptions, is in reality a moral power, operating on our conduct, and affecting our happiness or misery. Belief in coming good cheers us almost as much as if it were already come; a like strength of conviction of approaching evil is to the same degree depressing; "the devils believe, and tremble." These two tests—readiness to act according to what we believe, and influence on the mental tone—effectually separate the state in question from mere notions, fancies, or suppositions, unaccompanied with credence. We have firm confidence in the food we eat being able to nourish us; we exert ourselves to procure that food, and when we feel hungry, and see it before us, we have the mental elation arising from a near and certain prospect of relief and gratification. If there be anything that we work languidly to procure, and feel little elated by being near or possessing, our conviction is proved to be feeble as to the utility of that thing, or as to the pleasure we shall derive from it. So, in employing means to compass ends, as when we sow that we may reap, work that we may obtain abundance, study that we may be informed—we have a certain confidence in the connection between the means and the ends; in other words, we are energetically urged to use those means, and having done so, we have the feeling as if the end were already attained.

Even in cases the furthest removed in appearance from any action of ours, there is no other criterion. We believe a great many truths respecting the world, in the shape of general propositions, scientific statements, affirmations on testimony, etc., which are so much beyond our own little sphere, that we can rarely have any occasion to involve them in our own procedure, or to feel any hopeful elation on their account. We likewise give credit to innumerable events of past history, although the greater number of them have never any consequences as regards ourselves. Yet, notwithstanding such remoteness of interest, the tests now mentioned must apply; otherwise, there is no real conviction in any one instance.

There is a distinction, first characterized by Aristotle, between potentiality and actuality (*posse* and *esse*), which truly represents two different states of mind of real occurrence. Besides the actual doing of a thing, we know what it is to be in a state of *preparedness* to act, before the emergency has arisen, or while it is still at a distance and uncertain. The thirsty traveler, not knowing of a spring where he may drink, is debarred from the act that his condition prompts him to, but he is in an attitude of mind that we call being ready for action the moment the opportunity arrives. We all carry about us a number of unexecuted resolutions, some of them perhaps remaining so to the last, for want of the occasion. They are not, on that account, to be set aside as having no part in our nature; they are genuine phases of our activity. So it is with many things believed in by us, without any actual prospect of grounding actions, or staking our welfare, upon such things. When we say we believe that the circumference of the globe is 25,000 m., if not repeating an empty sound, or indulging an idle conception, we give it out that if any occasion arise for acting on this fact, we are ready to do so. If we were about to circumnavigate the earth, we should commit ourselves to this reckoning. Should there be any hesitation on the point when the time for action came, the professed belief would be shown to be hollow, no matter how often we heard the statement, or repeated it, with acquiescence. The genuineness of conviction is notoriously open to question, until an opportunity of proceeding upon it occurs. Very often we deceive ourselves and others on the point—whether we are in full potentiality or preparedness in some matter of truth or falsehood. There is a very large amount of blind acquiescence in, or tacit acceptance of, propositions which never become the subject of any real or practical stake. These beliefs falsely so called confuse the line of demarkation between mere intellectual notions and states of credence or conviction. Of this nature is the acceptance given by the mass of mankind to the statements they are accustomed to hear from the better informed class respecting the facts of science and the transactions of history. They do not dispute those statements; and yet they might be little disposed to commit their serious interests to such facts. So with regard to the religious creed handed down from parent to child. Some are found believing, in the full import of the term; others, opposing no negative in any way, yet never perform any actions, or entertain either hopes or fears, as a consequence of their supposed acceptance of the religion of their fathers; their belief, accordingly, must be set down as a nonentity.

2. There is considerable interest attached to the inquiry into the *sources* or operating causes of this efficacious attribute of our active nature. What are the influences that determine us to adopt some notions as grounds of action and elements of hope or depression, in preference to others? The common answer to this question is the possession of evidence, of which two kinds are reckoned by some schools—namely, experience and

intuition; while others recognize experience alone, and reject the intuitive as a sufficient foundation of belief.

As regards the actual sources of men's convictions, it is undeniable that many things are credited without any reference to experience. The existence of superstitions is an example. So the partialities arising out of our likings to particular persons, and the undue depreciation of the merits of those whom we dislike, present instances equally removed from the criterion of experience. It is evident, therefore, that men do not abide by that criterion, even granting that they ought to do so. Accordingly, it is one of the tasks of the mental philosopher to specify the portions of our constitution that give birth to false, mistaken, or unfounded beliefs; and in so doing he indicates, first, certain intuitive impulses connected with our active nature; and secondly, our various feelings, or emotions. Whether the intuitive be a source of authentic beliefs, may be a matter of doubt; there is no doubt as to its being a genuine source of real convictions. We have a decided tendency from the first to believe that the present state of things will continue, and that the absent resembles the present. He that has always seen water liquid, cannot at first be convinced that it is ever or anywhere solid. We have always a great difficulty in surmounting the primitive impulse to consider other men's minds as exactly like our own. It is the tendency of the uncultured human being to overgeneralize; and experience comes as a corrective, often very painful to submit to. Then, again, as regards the emotions, it is found that every one of these, if at all strong, is liable to blind us to the realities of the world. Fear is a notable example. Under a fright, a man will believe in the approach of the direst calamities. Superstition is, for the most part, the offspring of men's fears. The effect of a strong emotion is to exclude from the mind every fact or consideration except those in keeping with itself. Intense vanity so lords it over the current of the thoughts and the course of the observations, as to present to one's mind only the very best side of the character. A fit of self-abasement and remorse will work the contrary effect.

It is plain enough, therefore, that we are very often in the wrong, by trusting to our intuitive tendencies, and as often so under our emotions; while we are as ready to act, and to derive comfort or the opposite, under false beliefs, as under the very soundest that we can ever arrive at. The practice of life points to *experience* as the check to wrong believing. If we find on trial that another man's feelings differ very much from ours in the same circumstances, we stand corrected, and are perhaps wiser in future. So, in science, experiment is the ultimate canon of truth. There prevails, notwithstanding, in one school of philosophy, comprising the majority of metaphysical philosophers both in England and in Germany and France, the opinion that experience is not the only source even of *sound* or true beliefs. There are those who contend for an *à priori* origin of scientific first principles; such, for example, as the axioms of mathematics. "Things that are equal to the same thing are equal to one another," is one of the class about which this dispute reigns. There is also a doctrine current that the law of causation has an authority derived from intuition. Another class of beliefs relates to matters altogether beyond experience; such is the metaphysical doctrine of the infinite. These various convictions—*à priori*, as they are called, being grounded solely in the internal impulses of the human mind—are all open to one common remark. It must be conceded that some intuitive beliefs are unsound, seeing that we are obliged to reject a greater or less number because of their being flatly contradicted by our experience. But if any have to be rejected in this way, why may not all be; and what criterion, apart from experience, can be set up for discriminating those that we are to retain? Man undoubtedly has boundless longings; and the doctrine of the infinite corresponds in a manner to these. But in actual life we find very few of our desires fully gratified, not even those most honorable to the human mind, such as curiosity, the passion for self-improvement, and the desire of doing good. How, then, are we to ascertain which of the longings carries with it its own necessary fulfillment? Moreover, the intuitive tendencies are exceedingly various in men; and all cannot be equally true.

Testimony, which is properly reckoned one of the sources of belief, is, in its operation, partly founded on an intuitive tendency, and partly on experience. We at first believe whatever we are told; the primitive phase of our nature is credulity; the experience that we soon attain to of untrue statements puts us on our guard, and we learn to receive testimony under some circumstances, and from some persons, and not in all cases indiscriminately.

3. *Responsibility for Belief.*—A lengthened controversy arose some time ago, on the saying of Lord Brougham, that "man is no longer accountable to man for his belief, over which he has himself no control." Reduced to precise terms, the meaning of this assertion is: a man's belief being involuntary, he is not punishable for it. The question therefore arises, *how far* is belief a voluntary function? for it is known that the will does to some extent influence it.

What a man shall see when he opens his eyes is not in his own power; but the opening of the eyes is a voluntary act. So, after listening to a train of arguments on a certain dispute, we might be irresistibly inclined to one side; but, supposing us to live in a country where the adhesion to that side is criminal, and punished severely, we should very likely be deterred from hearing or reading anything in its favor. To this extent, the adoption of a belief is voluntary. The application of strong motives of the nature

of reward or punishment is sufficient to cause one creed to prevail rather than another, as we see in those countries and in those ages where there has been no toleration of dissent from the established religion. The mass of the people have been in this way so fenced in from knowing any other opinions, that they have become conscientiously attached to the creed of their education.

When the question is asked, therefore, whether punishment can control men's beliefs, and not their professions merely, all history answers in the affirmative, as regards religious and political creeds, on which the majority of mankind, being insufficient judges of themselves, are led by tradition and by education. But in matters of daily practice, where the simplest can judge as well as the wisest, the case is altered. No severity of threat could bring a man into the state of believing that his night's rest was hurtful to him; he might be overawed into saying that it was so, but he would never act out his forced affirmation, and therefore he would show that he did not believe it.

If the sentence of Lord Brougham is held to imply that all beliefs are beyond the power of external motives, and therefore that rewards and punishments can go no further than making outward conformity, we must pronounce it erroneous. For granting that motives cannot have a direct efficacy on the state of a man's convictions—which cannot be conceded in all cases—yet the *indirect* influence is so great as to produce the unanimity of whole nations for centuries in some one creed. But if it is only meant, that such indirect means *ought not* to be applied to sway men's convictions, this is merely a way of affirming the right of free thought and inquiry to all mankind, and the iniquity of employing force on such a matter.—On the subject of belief generally, see Bain on the Emotions and the Will.

BELISA'RIUS (in Slavonic, *Beli-tzar*, "White Prince"). This heroic and loyal soldier, to whom the emperor Justinian was principally indebted for the glory of his reign, was born at Germania, in Illyria, about 505 A.D. He first assumed a conspicuous position when he was appointed to the command of the eastern army of the empire, stationed on the confines of Persia, where, in 530 A.D., he gained a victory over a Persian army nearly twice as large as his own. The historian Procopius was at this time secretary to Belisarius. In the following year, when the Persians had penetrated into Syria, intending to attack Antioch, B. being compelled by the impatience of his troops to offer battle at Callinicum, a town at the junction of the rivers Bilecha and Euphrates, was defeated, and in consequence recalled. This petulant injustice, however, did not weaken that principle of duty which ever controlled and inspired the great soldier. He still remained the firm supporter of his sovereign. In Constantinople, the strife of the two parties, styled respectively "the green" and "the blue," had endangered the authority and even the life of Justinian; already a new emperor, Hypatius, had been elected, when B., at the head of the life-guards, attacked and slew, in the race-course, 30,000 of the green or anti-loyalist party, and thus restored tranquillity. Previous to this, he had married a wealthy but profligate lady, Antonia, whom he loved with the same blind uxoriousness that Marcus Aurelius exhibited towards Faustina. The only points in his history which are not edifying, are those in which he yielded to her noxious solicitations. The military career of B. may be divided into two great epochs; the war against the Vandals in Africa, and the war against the Goths in Italy, which again subdivides itself into two campaigns, with an interval of four years between them. The first of these epochs was commenced by Justinian sending B., in 533 A.D., with an army of 15,000 men into Africa, in order to recover the provinces there held by the Vandal king, Gelimer. After achieving two victories, B. made the king a prisoner, seized his treasures, and after conquering Sardinia, Corsica, and the Balearic Isles, he brought him to Constantinople, where he appeared in a triumphal procession of the conqueror—the first that a subject had enjoyed since the days of Tiberius. The African Vandals never recovered from this overthrow. Medals were struck in B.'s honor; and on the 1st Jan., 535, he was invested with the dignity of "consul," and granted a second triumph, according to the old republican style. The second war was occasioned by the divisions existing in the royal family of the Ostrogoths, which induced Justinian to attempt to wrest Italy from the hands of the barbarians. In 535, B. conquered Sicily; and in the autumn of 536, he crossed over to lower Italy, where all the cities submitted to him except Naples, which he carried by storm. On the 10th of Dec. he entered Rome, having made an amicable arrangement with the inhabitants. As he found his forces not strong enough to contend with the Goths in open field, he allowed himself to be inclosed and besieged in Rome: after the defense had lasted a year, the Goths raised the siege. In 538, Narses had been sent with a reinforcement for the army in Italy; but some misunderstanding occurring between the two generals, they were prevented from relieving Milan, which in 539 was carried and devastated by Braias, nephew of the Gothic king, Vitiges. Consequently, Narses was recalled from Italy; and B., now placed at the head of both armies, refused to assent to a treaty proposed to king Vitiges by Justinian's ambassadors. Vitiges had persuaded the Persian king, Chosroes, to invade the eastern Roman territory. B. now drove the Goths back to Ravenna, which he captured in 540, along with Vitiges himself. But before he could complete his conquest of the Goths, he was recalled by Justinian to Constantinople, where he soon appeared, bringing with him the king Vitiges, several Gothic chieftains, and the royal

treasures. In 541–42, he was engaged in a campaign against the Persians, who had captured Antioch; but was again recalled, on account of slanderous representations made to the emperor, and the enterprise necessarily proved indecisive. His second great struggle with the Ostrogoths now begins. In 544, the barbarians, under Totila, again invaded and reconquered Italy. B. was sent against them, but with an insufficient army. He, however, maintained his ground for five years, harassing the enemy by his skillful movements, and even succeeded so far as to regain possession of Rome. But, in spite of his repeated entreaties, no reinforcements were sent to him; and in Sept., 548, he gave up the command, his rival, Narses, being appointed in his place. After ten years of retirement, B. once more came forward at the head of an army hastily collected, and overthrew the Bulgarians, who had threatened Constantinople. Here this faithful servant, who at Ravenna had, in a spirit of noble loyalty unknown to the warriors in those selfish and ambitious times, refused the crown of Italy offered to him by the Goths, was at length accused of a conspiracy against Justinian, and imprisoned, Dec., 563; but according to Malala and Theophanes, Justinian became convinced of B.'s innocence, and restored him, after six months, to all his honors. He died Mar., 564.

The biography of B. has been treated with great license by writers of fiction, especially by Marmontel, who has represented the hero as cruelly deprived of sight, and reduced to beg for his bread in the streets of Constantinople. Tzetzes, a writer of the 12th c., states that, during his half-year's imprisonment, B. suspended a bag from the window of his cell, and exclaimed to those who passed by: "Give an obolus to B., who rose by merit, and was cast down by envy!" but no writer contemporary with B. mentions this circumstance. Lord Mahon, in his *Life of Belisarius* (Lond. 1829), endeavors, but without success, to confirm the tradition, or rather the fiction, of B. being deprived of sight and reduced to mendicancy. This fiction supplies the subject of a fine picture by the French painter Gérard.

In figure, B. was tall and majestic; in disposition, humane and generous; pure in his morals, temperate in his habits, a valiant soldier, a skillful general, and above all, possessed by a sublime spirit of loyalty to his sovereign.

BELIZE. See BALIZE.

BELJU'RIE, or BAILJURIE, a t. of India, in the British district of Moradabad, n.w. provinces, 2 m. n.w. from Kashipur. Pop. '71, including part of Kashipur, 8253.

BELKNAP, a co. in New Hampshire; intersected by the Boston, Concord and Montreal railroad; 360 sq.m.; pop. '80, 17,948. The surface is hilly, soil fertile. Co. seat, Laconia.

BELKNAP, JEREMY, D.D., 1744–98; b. Mass., and graduate of Harvard; pastor in New Hampshire, and over Federal street church, Boston. He founded the Massachusetts historical society in 1791. Among his works are *History of New Hampshire*, and *American Biography*.

BELL. Bells are usually formed of a composition of copper and tin, called bell-metal. When the proper proportions of the two metals are fused together, the compound is poured into a mold. Authorities differ as to the best proportions of the copper and tin. Some give 80 parts of copper to 20 of tin, or 4 to 1; others state the proportions as being 3 to 1. In the reign of Henry III. of England, it would seem to have been 2 to 1; and the small bronze bells discovered by Mr. Layard in the palace of Nimroud, are found to contain 10 of copper to 1 of tin. Hand-bells are often made of brass, antimony alloyed with tin, German silver, real silver, and gold. The notion that in old times silver was mixed with bell-metal to sweeten the tone, is a mistake. Silver, in any quantity, would injure the tone. The quality of a bell depends not only on the composition of the metal it is made of, but very much also on its shape, and on the proportions between its height, width, and thickness; for which the bell-founder has rules derived from experience, and confirmed by science. The pitch of a bell is higher the smaller it is. For a peal of four bells to give the pure chord of ground tone (key-note), third, fifth, and octave, the diameters require to be as 30, 24, 20, 15, and the weights as 80, 41, 24, 10. A less quantity of metal than is due to the caliber of the bell though giving the same note, produces a meager harsh sound; and the real or fancied superiority in dignity of tone of some old bells, is ascribed to a greater weight of metal having been allowed for the same note than modern economy would dictate. Bells have been cast of steel, some of which have had a tone nearly equal in fineness to that of the best bell-metal, but deficient in length, having less vibration. Some have also been cast of glass, with a considerable thickness of the material; and these give an extremely fine sound, but are too brittle to stand the continued use of a clapper.

From a remote antiquity, cymbals and hand-bells were used in religious ceremonies. In Egypt, it is certain that the feast of Osiris was announced by ringing bells; Aaron, and other Jewish high-priests, wore golden bells attached to their vestments; and in Athens, the priests of Cybele used bells in their rites. The Greeks employed them (*koda*) in camps and garrison; and the Romans announced the hour of bathing and of business by the *tintinnabulum*. The introduction of bells into Christian churches is usually ascribed to Paulinus, bishop of Nola in Campania (400 A.D.); but there is no evidence of their existence for a century later. That they were first made in Campania, is

inferred from the name given to them—*campanæ;* hence *campanile*, the bell-tower. Their use in churches and monasteries soon spread through Christendom. They were introduced into France about 550; and Benedict, abbot of Wearmouth, brought one from Italy for his church about 680. Pope Sabinian (600) ordained that every hour should be announced by sound of bell, that the people might be warned of the approach of the *horæ canonicæ*, or hours of devotion. Bells came into use in the east in the 9th c., and in Switzerland and Germany in the 11th century. Most of the bells first used in Western Christendom seem to have been hand-bells. Several examples, some of them, it is believed, as old as the 6th c., are still preserved in Ireland, Scotland, and Wales. They are made of thin plates of hammered iron, bent into a four-sided form, fastened with rivets, and brazed or bronzed. Perhaps the most remarkable is that which is said to have belonged to St. Patrick, called the *Clog-an-cadhachta Phatraic*, or "the bell of Patrick's Will." It is 6 in. high, 5 in. broad, and 4 in. deep, and is kept in a case or shrine of brass, enriched with gems and with gold and silver filagree, and made (as an inscription in Irish shows) between the years 1091 and 1105. The bell itself is believed to be mentioned in the *Annals of Ulster* as early as the year 552. Engravings as well of the bell as of its shrine, with a history of both, by the Rev. Dr. Reeves of Lusk, were published at Belfast (where the relic is preserved) in 1850. Some of the Scotch bells, of the same primitive type, are figured and described in the *Illustrated Catalogue of the Archæological Museum at Edinburgh in* 1856 (Edin. 1859). The four-sided bell of St. Gall, an Irish missionary, who died about 646, is still shown in the monastery of the city which bears his name in Switzerland. Church-bells were suspended either in the steeples or church-towers, or in special bell-towers. They were long of comparatively small size; the bell which a king presented to the church of Orleans in the 11th c., and which was remarkable in its age, weighed only 2600 pounds. In the 13th c., much larger bells began to be cast, but it was not until the 15th c. that they reached really considerable dimensions. The bell "Jacqueline" of Paris, cast in 1400, weighed 15,000 pounds; another Paris bell, cast in 1472, weighed 25,000 pounds; the famous bell of Rouen, cast in 1501, weighed 36,364 pounds. The largest bell in the world is the great bell or monarch of Moscow, above 21 ft. in height and diameter, and weighing 193 tons. It was cast in 1734, but fell down during a fire in 1737, was injured, and remained sunk in the earth till 1837, when it was raised, and now forms the dome of a chapel made by excavating the space below it. Another Moscow bell, cast in 1819, weighs 80 tons. The great bell at Pekin, 14 ft. high, with a diameter of 13 ft., weighs 53½ tons; those of Olmütz, Rouen, and Vienna, nearly 18 tons; that first cast for the new palace at Westminster (but cracked), 14 tons; that of the Roman Catholic cathedral at Montreal (cast 1847), 13½ tons; "great Peter," placed in York Minster 1845, 10¾ tons; "great Tom" at Lincoln, 5½ tons; great bell of St. Paul's, 5 1/10 tons.—See an interesting article on Bells in the *Quarterly Review* for Sept., 1854.

From old usage, bells are intimately connected with the services of the Christian church—so much so, that apparently from a spirit of opposition, the Mohammedans reject the use of bells, and substitute for them the cry of the Imaum from the top of the mosques. Associated in various ways with the ancient ritual of the church, bells acquired a kind of sacred character. They were founded with religious ceremonies (see Schiller's ode), and consecrated by a complete baptismal service; received names, had sponsors, were sprinkled with water, anointed, and finally covered with the white garment or chrisom, like infants. This usage is as old as the time of Alcuin, and is still practiced in Roman Catholic countries. Bells had mostly pious inscriptions, often indicative of the wide-spread belief in the mysterious virtue of their sound. They were believed to disperse storms and pestilence, drive away enemies, extinguish fire, etc. A common inscription in the middle ages was:

Funera plango, fulgura frango, Sabbata pango,
Excito lentos, dissipo ventos, paco cruentos.

Among the superstitious usages recorded to have taken place in old St. Paul's church in London, was the "ringinge the hallowed belle in great tempestes or lightninges" (Brand's *Popular Antiquities*, vol. ii.). From this superstition possibly sprang the later notion, that when the great bell of St. Paul's tolled (which it does only on the death of a member of the royal family, or a distinguished personage in the city) it turned all the beer sour in the neighborhood—a fancy facetiously referred to by Washington Irving in the *Sketch-Book*. It would seem that the strange notion that bells are efficacious in dispelling storms, is by no means extinct. In 1852, the bishop of Malta ordered the church-bells to be rung for an hour to allay a gale.

Church-bells were at one time tolled for those passing out of the world. It was a prevailing superstition that bells had the power to terrify evil spirits, no less than to dispel storms; and the custom of ringing what was called the *passing-bell*, "grew [we quote the writer in the *Quarterly Review* above referred to] out of the belief that devils troubled the expiring patient, and lay in wait to afflict the soul the moment when it escaped from the body." . . . "The tolling of the passing-bell was retained at the reformation; and the people were instructed that its use was to admonish the living, and excite them to pray for the dying." But "by the beginning of the 18th c., the passing-bell, in the proper sense of the term, had almost ceased to be heard. The tolling, indeed, continued in the old fashion; but it took place after the death, instead of

before." The practice of slowly and solemnly tolling church-bells at deaths, or while funerals are being conducted, is still a usage in various parts of the country, more particularly as a mark of respect for the deceased. There is another use of the bell in religion, called the *pardon* or *ave bell*, abolished among Protestants. The pardon-bell was tolled before and after divine sèrvice, for some time prior to the reformation, to call the worshipers to a preparatory prayer to the Virgin Mary before engaging in the solemnity, and an invocation for pardon at its close. Bishop Burnet has recorded the order of a bishop of Sarum, in 1538, concerning the discontinuance of the custom. It runs thus: "That the bell called the pardon or ave bell, which of longe tyme hathe beeu used to be tolled three tymes after and before divine service, be not hereafter in any part of my diocesse any more tollyd."

The ringing of the *curfew-bell*, supposed to have been introduced into England by William the conqueror, was a custom of a civil or political nature, and only strictly observed till the end of the reign of William Rufus. Its object was to warn the public to extinguish their fires and lights at eight o'clock in the evening. The eight o'clock ringing is still continued in many parts of England and Scotland.

As the liberty of public worship in places of meeting by themselves was yielded to dissenters, by the various governments of Europe, only with reluctance, the use of bells in chapels as a summons to divine service is not allowed except in the more enlightened countries. Speaking on this subject as referring to England, lord chief-justice Jervis, in giving judgment on a case tried at the Croydon assizes in 1851, says: "With regard to the right of using bells in places of worship at all, by the common law, churches of every denomination have a full right to use bells, and it is a vulgar error to suppose that there is any distinction at the present time in this respect." Throughout England and Scotland, however, comparatively few dissenting places of worship possess bells—still fewer have steeples. In towns and villages, the places of worship connected with the established church are commonly distinguished by some kind of belfry or bell-cote with bells. The ringing of these for divine service on Sundays, and on other occasions, forms the theme of many poetical allusions. The lines of Cowper will occur to recollection:

> How soft the music of those village bells,
> Falling at interval, upon the ear,
> In cadence sweet! now dying all away,
> Now pealing loud again, and louder still,
> Clear and sonorous as the gale comes on.

On all that belongs to the playing of bells in belfries, the inventive genius of the Netherlands long since arrived at proficiency. In some of the church-towers of that country, the striking, chiming, and playing of bells is incessant; the tinkling called chimes usually accompanies the striking of the hours, half-hours, and quarters; while the playing of tunes comes in as a special divertisement. In some instances, these tune-playing bells are sounded by means of a cylinder, on the principle of a barrel-organ; but in others, they are played with keys by a musician. The French apply the term *carillons* to the tunes played on bells; but in England, it is more usual to give the term carillons to the suites of bells which yield this kind of music. In this last sense, the tower of *Les Halles*, a large building at Bruges, is allowed to contain the finest carillons in Europe. There is a set of music-bells of this kind in the steeple of St. Giles's church, Edinburgh. On these, tunes are played for an hour daily at certain seasons by a musician, who has a small salary from the civic corporation.

Many of the church-towers in London are provided with peals of bells, the ringing of which is a well-known practice. Eight bells, which form an octave or diatonic scale, make the most perfect peal. The variety of *changes* or permutations of order that can be rung on a peal, increases enormously with the number of bells: 3 bells allow 6 changes; 4 bells, 24; 12 bells give as many as 479,001,600 changes. The ringing of peals differs entirely from tolling—a distinction not sufficiently recognized in those places where an ordinary ringing of bells is made to suffice alike for solemn and festive occasions. The merry peal almost amounts to an English national institution. It consists in ringing the peal in moderately quick time, and in a certain order, without interruption, for the space of an hour. Merry peals are rung at marriages (if ordered), and at other festive events, the ringers being properly paid, according to use and wont. The English appear to be fond of these peals, and the associations which they call up. They actually make bequests to endow periodical peals in their parish church-towers; leaving, for example, so much money to ring a merry peal for an hour on a certain evening of the week, or to commemorate victories, or some other subjects of national rejoicing, in all time coming. One of the most celebrated peals of bells in London is that of St. Mary-le-Bow, Cheapside, which form the basis of a proverbial expression meant to mark emphatically a London nativity—"Born within the sound of Bow-bells." Brand speaks of a substantial endowment by a citizen for the ringing of Bow-bells early every morning to wake up the London apprentices. The ringing of bells in token of merriment is an old usage in England, as we learn from Shakespeare:

> Get thee gone, and dig my grave thyself,
> And bid the merry bells ring to thy ear,
> That thou art crowned, not that I am dead.

Sometimes, in compliment to a newly opened church, efforts are made to furnish its belfry with the proper number of bells, and to endow it at once for a weekly merry peal.

It is common for some of the humbler class of parishioners to form a company of bell-ringers, acting under the authority of the church-wardens. Some endowments for peals embrace a supper, as well as a money payment to the ringers; and of course, in such circumstances, there is little risk of the merry peal falling into desuetude. The consequence is, that what with marriages, and other festive celebrations, and as a result of endowments, merry peals are almost constantly going on somewhere in the metropolis—a fine proof, it may be said, of the naturally cheerful and generous temperament of the English, and of their respect for old customs. In Lancashire, the art of playing on bells is cultivated with much enthusiasm and success. The bells are small, and arranged on a movable stand; they are struck by a small instrument which is held in each hand of the performer, and produce a sweet tinkling kind of music.

The custom of hanging bells on the necks of horses, cows, and other animals, was in use by the Romans, and still survives. The bells give notice of approach in the dark, and hung on cows, goats, or sheep, these animals can be easily found in the woods, or on the mountains. The charming poetical allusion of Gray—

And drowsy tinklings lull the distant folds—

will be called to remembrance. In some parts of England, as many as eight small bells, forming an octave, are attached to the harness of wagon-horses. The attaching of bells in a fanciful manner to riding and sleigh-horses is common in some parts of Europe and America.

The term bell is infused in much of our conversational phraseology. "To bear the bell," is a phrase which we previously attempted to explain. At one period, a silver bell was the prize in horse-races in England, and the winning horse was said to bear away the bell. A less probable explanation is, that the phrase originated in the custom of one of the most forward sheep in a flock carrying a bell. Hence, at least, "bell-wether of the flock," a phrase applied disparagingly to the leader of a party. The old fable, in which a sagacious mouse proposes that a bell shall be hung on the neck of the cat, so that all the mice may be duly warned of her approach, has given rise to the well known-phrase of "belling the cat." Any one who openly and courageously does something to lower the offensive pretensions of a powerful and dangerous person, is said "to bell the cat."

The *hanging of bells* in dwelling-houses, and ringing them by means of wires from the different apartments, is quite a modern invention; for it was not known in England in the reign of queen Anne. Lately, there has been a great improvement in domestic bell-hanging. Instead of traversing the apartments, and turning and winding by means of cranks, the wires are carried directly upward in tubes in the walls to the garret: thence from a row of cranks they descend together to their respective bells, which are hung in one of the lower passages. More recently, there has been introduced a system of electric bells, which is likely to supersede all others. The arrangement consists of an electro-magnet, with its armature fastened at one end by a spring, and terminating at the other in a hammer, by which the bell is struck. The battery may be placed in any part of the building, and as there is no motion in the wires, no cranks or other apparatus are required. Contact is made by pressing a stud, and messages may be sent to any part of the house, by the Morse alphabet, or other code of signals.

BELL, a co. in s.e. Kentucky, bordering on West Virginia and Tennessee, and drained by the Cumberland river; 500 sq.m.; pop. '80, 6,055—180 colored. The surface is rough, and in some parts mountainous. Agriculture is the principal business. Co. seat, Pineville. This co. was formerly called Josh Bell.

BELL, a co. in w. Tennessee on the Mississippi, recently established; a good cotton section. Co. seat, Grand Junction.

BELL, a co. in Texas, in a fine prairie region on the Leon river, well adapted to general agriculture; 850 sq.m.; pop. '70, 9771—1104 colored. Co. seat, Belton.

BELL, ANDREW, D.D., author of the *Madras System of Education*, was born at St. Andrews in 1753, and educated at the university of that place. Subsequently he took orders in the church of England; and after residing for some time in British America was appointed one of the chaplains at fort St. George, Madras. While here he was intrusted by the directors of the East India company with the management of an institution for the education of the orphan children of the European military. The arduous character of his new duties compelled him to reflect seriously on the best means of fulfilling them. As he found it impossible to obtain the services of properly qualified ushers, he at length resorted to the expedient of conducting the school by the aid of the scholars themselves. Hence originated the far-famed "MONITORIAL SYSTEM" (q.v.). After superintending the institution for seven years, the state of his health forced him to return to Europe. On his departure he received a most flattering testimonial from the directors of the school. In 1797, after his arrival in England, B. published a pamphlet entitled *An Experiment in Education, made at the Male Asylum of Madras; suggesting a System by which a School or Family may teach itself under the Superintendence of the Master or Parent.* This pamphlet attracted little attention until Joseph Lancaster, a dissenter, commenced to work upon the system, and succeeded in obtaining for it a large measure of public recognition. In 1803, Lancaster also published a tractate on education, recommending the monitorial system, as it was now called, and admitting B. to be the original

inventor of it, an admission which he afterwards discreditably retracted. Lancasterian schools now began to spread over the country. The church grew alarmed at the successful results of the efforts made by dissenters to educate the poor, and resolved to be philanthropical ere it was too late. B. was put up against Lancaster. Money was collected and an immense amount of emulation was excited in the bosoms of churchmen. Fortunately, however, this rivalry produced only beneficial effects, and the motives which induced it may therefore be forgotten. Later in life B. was made a prebendary of Westminster, and master of Sherborn hospital, Durham. He was also a member of various learned societies. He died at Cheltenham, Jan. 28, 1832. He left (besides a valuable estate) £120,000 of three per cent stocks for the purpose of founding various educational institutions in Edinburgh, Glasgow, Leith, Aberdeen, Inverness, Cupar, and St. Andrews.

BELL, Sir CHARLES, an eminent surgeon, whose discoveries in the nervous system have given him a European fame, was born at Edinburgh in 1778, and while a mere youth assisted his brother John (afterwards noticed) in his anatomical lectures and demonstrations. In 1797 he was admitted a member of the Edinburgh college of surgeons, and soon after appointed one of the surgeons of the royal infirmary. In 1806 he proceeded to London, and for some years lectured with great success on anatomy and surgery at the academy in Great Windmill street. Admitted, in 1812, a member of the royal college of surgeons, London, he was elected one of the surgeons of the Middlesex hospital, in which institution he delivered clinical lectures, and raised it to the highest repute. To obtain a knowledge of gunshot wounds, he twice relinquished his London engagements—the first time after the battle of Corunna in 1809, when he visited the wounded landed on the southern coasts of England; the other after the battle of Waterloo, when he repaired to Brussels and was put in charge of a hospital with 300 men. In 1824, he was appointed senior professor of anatomy and surgery to the royal college of surgeons, London, and subsequently a member of the council. On the establishment of the London university, now university college, in 1826, B. was placed at the head of their new medical school. He delivered the general opening lecture in his own section, and followed it by a regular course of characteristic lectures on physiology; but soon resigned, and confined himself to his extensive practice, which was chiefly in nervous affections. In 1831 he was one of the five eminent men in science knighted on the accession of William IV., the others being sir John Herschel, sir David Brewster, sir John Leslie, and sir James Ivory. In 1836 he was elected professor of surgery in the university of Edinburgh. He was a fellow of the royal societies of London and Edinburgh, and a member of some other learned bodies. Author of various works on surgery and the nervous system, and editor, jointly with lord Brougham, of Paley's *Evidences of Natural Religion*, B. was one of the eight distinguished men selected to write the celebrated *Bridgewater Treatises*, his contribution being on *The Hand, its Mechanism and Vital Endowments, as evincing Design* (1834). He died suddenly, April 30, 1842. Among his principal works are: *The Anatomy of the Brain Explained in a Series of Engravings*, 12 plates (Lond. 1802, 4to); *A Series of Engravings Explaining the Course of the Nerves*, (Lond. 1804, 4to); *Essays on the Anatomy of Expression in Painting*, plates (Lond. 1806, 4to); posthumous edition much enlarged, entitled *The Anatomy and Philosophy of Expression as connected with the Fine Arts* (Lond. 1844, 8vo); *A System of Operative Surgery*, 2 vols. (Lond. 1807-9; 2d ed. 1814); *Dissertation on Gunshot Wounds* (Lond. 1814, 2 vols. 8vo); *Anatomy and Physiology of the Human Body*, 3 vols. (1816); various papers on the nervous system which originally appeared in the *Philosophical Transactions; Exposition of the Natural System of the Nerves of the Human Body* (1824); *Institutes of Surgery* (Edin. 2 vols. 1838, 12mo); Animal Mechanics, contributed to the *Library for the Diffusion of Useful Knowledge* (1828); *Nervous System of the Human Body* (1830), 4to. See *Correspondence of Sir Charles B.* (1870).

BELL, CHARLES H., 1798-1875; b. N. Y.; rear-admiral in the U. S. navy. He served in the war with England in 1812, and in the rebellion, rising to commodore in 1862, and admiral in 1866.

BELL, GEORGE JOSEPH, an eminent lawyer, brother of Sir Charles, was b. at Edinburgh, March 26, 1770, and passed advocate in 1791. Acknowledged one of the greatest masters of commercial jurisprudence of his time, and in particular of that department of it which relates to the laws of bankruptcy, he was, in 1822, appointed professor of Scots law in Edinburgh university; and in 1823, a member of the commission for inquiring into Scottish judicial proceedings. Subsequently, he was member of a commission to examine into and simplify the mode of procedure in the court of session. On the report, drawn up by Bell, was founded the Scottish judicature act, prepared by him, which effected many important changes in the forms of process in the superior courts of Scotland; the jury court being abolished as a separate judicature, and conjoined with the court of session. Appointed in 1831 one of the clerks of the court of session, he was, in 1833, chairman of the royal commission to examine into the state of the law in general. He also prepared a bill for the establishment of a court of bankruptcy in Scotland. His principal works are—*Commentaries on the Laws of Scotland, and on the Principles of Mercantile Jurisprudence* (Edin. 1810, 4to; 5th ed. 1826, 2 vols. 4to); *Principles of the Law of Scotland* (Edin. 1829, 8vo; 4th ed. 1839, 8vo); and *Commentaries on the*

Recent Statutes Relative to Diligence or Execution against the Movable Estate, Imprisonment, Cessio Bonorum, and Sequestration in Mercantile Bankruptcy (Edin. 1840, 4to). Bell d. Sept. 23, 1848.

BELL, HENRY, the successful introducer of steam-navigation into Europe, fifth son of Patrick Bell, a mechanic, was b. at Torphichen, Linlithgowshire, Scotland, April 7, 1767. After working three years as a stone-mason, he was, in 1783, apprenticed to his uncle, a mill-wright. He was instructed in ship-modeling at Borrowstounness, and completed his knowledge of mechanics with an engineer at Bell's Hill. Repairing to London, he was employed by the celebrated Mr. Rennie. About 1790 he returned to Glasgow, and in 1808 removed to Helensburgh, where he kept the principal inn, and devoted himself to mechanical experiments. How far Bell was anticipated by Fulton and others, in his application of steam to navigation, will be considered under the head of STEAM NAVIGATION. In January, 1812, a small vessel, 40 ft. in length, called the *Comet*, built under his directions, and with an engine constructed by himself, was launched on the Clyde with success—the first on European waters. Five years previously, on Oct. 3, 1807, Mr. Fulton, a Scottish engineer in America, had placed the first steamboat on the Hudson. Bell d. at Helensburgh, Nov. 14, 1830. A monument was erected to his memory at Dunglass point on the Clyde.

BELL, HENRY H., 1807–67; b. N. C.; an American naval officer, capt. in 1862, commodore the next year, and rear-admiral in 1866. He was fleet capt. under Farragut at the capture of New Orleans. In 1867, he commanded the East India squadron, and was drowned while endeavoring to get his barge over the bar at the entrance of Osada river, Japan.

BELL, JOHN, 1797–1869; b. Tenn.; a graduate of Nashville university; a lawyer, and member of congress for 14 years from 1827. In 1834, he was speaker of the house of representatives, in 1841 secretary of war; was chosen senator in 1847, and again in 1853. In 1860, he was one of the four candidates for president of the United States, and got the votes of Kentucky, Tennessee, and Virginia, 39 in all.

BELL, JOHN, of Antermony, a celebrated Asiatic traveler, born in the w. of Scotland in 1691, studied for the medical profession. In 1714, he went to St. Petersburg, and soon after was appointed physician to an embassy from Russia to Persia. In 1719, he was sent upon another to China, through Siberia. In 1737, he was sent on an embassy to Constantinople, and afterwards settled for some years in the Turkish capital as a merchant. In 1747, he returned to Scotland, and died at Antermony, July 1, 1780. His *Travels from St. Petersburg to various Parts in Asia*, in 2 vols. 4to, were published by subscription at Glasgow in 1763. From its simplicity of style, the work has been described as "the best model, perhaps, for travel-writing in the English language."

BELL, JOHN, an eminent surgeon, second son of the Rev. William Bell, an Episcopal minister in Edinburgh, was b. in that city, May 12, 1763. He studied under the celebrated Black, Cullen, and Monro *secundus;* and while attending the anatomy classes of Dr. Monro, first conceived the idea of teaching the application of the science of anatomy to practical surgery. He commenced, in 1786, lecturing at Edinburgh on surgery and anatomy, and in 1793 published the first volume of his *Anatomy of the Human Body;* in 1797, appeared the second volume; and in 1802, the third. A volume of anatomical drawings by himself, illustrative of the structure of the bones, muscles, and joints, was published in 1794; and another volume, illustrative of the arteries, with drawings by his brother, afterwards sir Charles Bell, appeared in 1801. In 1798, Bell passed some weeks at Yarmouth among the seamen of lord Duncan's fleet wounded at Camperdown; and in 1800 he published a *Memorial concerning the Present State of Military Surgery.* His *System of the Anatomy of the Human Body*, and his *Discourses on the Nature and Cure of Wounds* (Edin. 1793–95), were translated into German. A good classical scholar, he was distinguished alike for his great conversational powers and general information. Early in 1816, he was thrown from his horse, and, his health declining, he went to Paris, and thence proceeded to Italy. He died at Rome, of dropsy, April 15, 1820. Besides the works mentioned, he was the author of *The Principles of Surgery*, 3 vols. 4to, 1801–1807; new edition, edited by his brother, sir Charles Bell, 1826. A posthumous work, entitled *Observations on Italy*, edited by bishop Sandford of Edinburgh, was published by his widow.

BELL, JOHN, an eminent sculptor, remarkable for rejecting the classical antique model, and following nature only in his works, b. in Norfolk in 1811, first exhibited at the royal academy, London, in 1832, a religious group. His works are numerous, and of high and original merit. B.'s statues of lord Falkland, exhibited in model at Westminster hall, 1847, and sir Robert Walpole, 1854, were commissioned for the new houses of parliament. One of his best known designs is a monument to the guards who fell in the Crimea, executed in 1858. In decorative art, he has also distinguished himself. He was one of the sculptors of the prince consort memorial in Hyde park, London, which was unveiled in 1873. B. is the author of a *Free Hand Drawing-book for the Use of Artisans.*

BELL, LUTHER V., LL.D., 1806–62; b. N. H.; graduate of Bowdoin, and in medicine of Dartmouth; practiced in New York, and was president of the asylum for the insane

at Somerville, Mass. In 1861, he was made brigade surgeon in the army, and at the time of his death was medical director of a division.

BELL, ROBERT, an industrious and versatile literary writer, the son of a magistrate, was b. at Cork, 10th Jan., 1800, and, when very young, obtained an appointment in a government department in Dublin. He was for a time editor of the government journal, *The Patriot*. In 1828, he removed to London, and was appointed editor of *The Atlas* newspaper. In 1839, in conjunction with sir Edward Bulwer Lytton and Dr. Lardner, he started *The Monthly Chronicle*, a literary periodical, published by Longman & Co.; and latterly was editor of it. In 1841, he retired from *The Atlas*. For Lardner's Cyclopædia, Bell wrote *The History of Russia*, 3 vols., and *The Lives of the English Poets*, 2 volumes. The last volume of Southey's *Naval History*, left unfinished by the author, was also written by him, as was the concluding volume of Mackintosh's *History of England*. At the London theaters, three five-act comedies have been produced by him. He was author, also, of *The Ladder of Gold*, a novel, 3 vols., 1850; *Heart and Altars*, a collection of tales, 3 vols.; *Life of Canning; Outlines of China; Memorials of the Civil War*, consisting of the Fairfax correspondence, 2 vols.; *Wayside Pictures through France, Belgium, and Holland*. In 1854, he commenced an annotated edition of the English poets; and received from the king of the Belgians a gold medal, as a token of his majesty's sense of his services to literature. He died in 1867.

BELL, THOMAS, a distinguished naturalist, the son of a medical practitioner, was b. at Poole, Dorsetshire, in 1792. In 1814, he went to London, and studied at Guy's hospital, and, in 1815, passed the college of surgeons. In 1817, he commenced a course of annual lectures on dental surgery at Guy's hospital, where he also for some time delivered lectures on comparative anatomy. He was one of the founders of, and a principal contributor to, *The Zoological Journal*, of which five volumes were published; also one of the members of the zoological club of the Linnæan society, afterwards incorporated with the zoological society. Elected in 1828 a fellow of the royal society, in 1840 he was appointed its secretary. In 1836, he became professor of zoology in king's college, London. On the establishment of the Ray society, in 1844, for the publication of rare and costly works on natural history, he was elected its first president. In 1853, he resigned the secretaryship of the royal society, on being elected president of the Linnæan society. He is author of a *History of British Reptiles*, in Van Voorst's series of British natural history, 1829; a *History of British Quadrupeds*, same series, 1836; and a *History of the British Stalk-eyed Crustacea*, same series, 1853. In 1833, he commenced a *Monograph of the Testudinata*. The article "Reptiles," in Darwin's *Zoology of the Voyage of the Beagle*, was written by Bell. His last work of interest was a new edition of Gilbert White's *Natural History and Antiquities of Selborne*, on which he began to busy himself in 1872. B. is appropriately the proprietor of the manor of Selborne.

BELLA, a thriving t. of Italy, in the province of Basilicata, with a pop. of between 5000 and 6000.

BELLA, STEFANO DELLA, a famous Italian engraver, was b. at Florence, 18th May, 1610. He was intended for a goldsmith, but he soon left that calling and devoted himself to engraving. He executed upwards of 1400 different works, of almost all subjects —battles, sea-pieces, landscapes, animals, etc. All are characterized by freedom and delicacy, and give evidence of high imagination on the part of the author, and also of much patient and careful manipulation. One of his most admired works is a view of the Pont-Neuf, Paris. He died 12th July, 1664.

BELLADONNA, DWALE, or DEADLY NIGHTSHADE (*Atropa belladonna*), a plant of the natural order *solanaceæ* (q.v.); an herbaceous perennial, growing up every year as a bush, from two to six feet high, with ovate entire leaves, and bell-shaped flowers of a lurid purple color, which are fully larger than those of the common harebell, stalked and solitary in the axils of the leaves. It produces berries, of the size of a middle-sized cherry, and which, when ripe, are of a shining black color, and of a sweetish and not nauseous taste, although the whole plant has a disagreeable heavy smell. It is a native of the southern and middle parts of Europe, and is not uncommon in England, in the neighborhood of towns and of ruins. All parts of the plant are narcotic and poisonous, and fatal consequences not unfrequently follow from the eating of its berries, which have an inviting appearance. Its roots have sometimes been mistaken for parsnips. Dryness of the mouth and throat, dilatation of the eyes, obscurity of vision, paralytic tremblings, loss of sensation, delirium, and stupor, are among the effects of poisoning by belladonna. When death takes place from this cause, corruption ensues with extraordinary rapidity. B. is, however, of great value in medicine, soothing irritation and pain, particularly in nervous maladies, and is administered both internally and externally in the form of extract, tincture, ointment, and plaster, which are generally prepared from the dried leaves, sometimes from the root. It is particularly useful, from its power of dilating the pupil of the eye, and is constantly employed by oculists, both for examinations and operations. It is also applied to the eye to diminish the sensibility of the retina to light. It has recently been recommended as a preventive of scarlet fever, apparently on the ground of its tendency, when administered in frequent small doses, to produce an eruption and an affection of the throat, somewhat similar to those

characteristic of that disease; but the evidence of its utility for this purpose is not sufficient to warrant confidence.—The name B., i.e., fair lady, is supposed to have originated in the employment of the juice for staining the skin. The name dwale is apparently from the same root with the French *deuil*, grief—an allusion to the same qualities which have obtained for the plant the appellation of deadly nightshade. *Atropa* is from *Atropos*, one of the fates.—The other species of *Atropa* are South American.

B. owes its active properties on the animal system to the presence of the alkaloid *atropine*, accompanied by another alkaloid, *belladonnine*. The alkaloid atropine is present in all parts of the plant, and in all the preparations. It is generally procured from the root of B., and then forms needle-shaped crystals, which are sparingly soluble in water, but readily dissolve in alcohol and ether. Atropine is a very active poison, and its effects on the animal system resemble in an intensified degree the manner in which B. acts. It has been introduced into medicine, along with its nitrate, its sulphate, and its hydrochlorate.

BELLADONNA LILY, *Amaryllis belladonna*, a very beautiful species of amaryllis (q.v.), with rose-colored drooping flowers clustered at the summit of the leafless flowering stem. It is a native of the cape of Good Hope and of the West Indies, has become naturalized in Madeira, and is a not unfrequent ornament of gardens in England. The flowering stem is about 18 in. high.

BELLAI, or BELLAY, GUILLAUME DU, lord of Langley; 1491–1543; a French gen., distinguished in the service of Francis I. He was an able soldier and diplomatist, Charles V. remarking that Langley's pen had fought more against him than all the lances in France. When Henry VIII. was seeking divorce from Catherine, Langley worked earnestly in favor of the king. His chief writings are his own memoirs in 7 vols. He was buried in the church of Mans, where a noble monument was erected to his memory.

BELLAIRE, a city in Belmont co., Ohio, on the Ohio river, 5 m. below Wheeling, on the Baltimore and Ohio, and the Cleveland and Pittsburgh railroads. Pop. '70, 4,033; in '80, 8,028. There are many manufacturing establishments, including glass-houses, nail factories, planing mills, etc. The city is supplied with gas and water, and has street railroads. Its growth has been very rapid.

BELLAMONT, or BELLOMONT, RICHARD COOTE, Earl of, 1636–1701; English governor of the colonies of New York and Massachusetts; a member of parliament and an early advocate of the cause of William of Orange; attainted in 1689, but was the same year made earl, and appointed receiver general to queen Mary. He was sent out as governor in 1698. He was popular with the people of the colonies, though suspected of a degree of hypocrisy in religion. Under his administration the famous capt. William Kidd was taken, sent to England, and hanged on charge of piracy.

BELLAMY, JACOBUS, a distinguished Dutch poet, was b. at Vliessingen (Flushing), Nov. 12, 1757, and d. Mar. 11, 1786. His parents were very poor, and he was indebted for his education to the patronage of a clergyman, and other persons, who had seen and admired the patriotic effusions of his boyish muse, and who subscribed to send him to the university of Utrecht. Here the talents already remarked in B. were devoted chiefly to poetry, though his benefactors had hoped that he would devote himself to theology. His first sentimental and anacreontic poems, published at Amsterdam in 1782, were followed by a series of earnest patriotic poems (*Vaderlandsche Gezangen*), and in the same year, a third volume full of merit (1785). A collected edition of his works appeared at Haarlem (1826), but it does not contain his most popular poem, *Roosje*. B. was possessed of a glowing spirit and fancy, as well as a fine taste and ease in composition. He deservedly ranks as one of the chief restorers of national literature in Holland.

BELLAMY, JOSEPH, D.D., 1719–90; b. Conn., graduate of Yale, and Congregational pastor; famous for the pungency of his preaching. His sermons and other doctrinal works have been published. He prepared many candidates for the ministry.

BELLARMINE, ROBERT, one of the most celebrated Catholic theologians, was b. at Monte Pulciano, in Tuscany, Oct. 4, 1542. He entered the order of Jesuits in 1560, and was distinguished among his *confrères* by the zeal with which he studied theology, the church-councils, the fathers, Hebrew, history, and the canon law. In 1563, he gave lessons in polite literature and astronomy at Florence; and in rhetoric, at Mondovi, 1564–'67. In his 27th year, when he went to Louvain as professor of theology, he began that long controversy with "heretics" which formed the main business of his life. In 1599, when he was made a cardinal against his own inclination, he used his influence over pope Clement VIII. to prevent the introduction of the Platonic philosophy into the university of Rome, on the ground of its being "pernicious;" but though himself a Jesuit, he honorably opposed the Dominicans with regard to the Pelagian writings of Molina. He seems, however, to have participated to some extent in that writer's suicidal ethics, for in his *Disputationes* he argues that, as the pope is the supreme authority in doctrine and morals, if he should call virtue vice, and vice virtue, we are bound to believe him, and to act accordingly. In 1602, he was appointed archbishop of Capua. After the death of Clement VIII., he contrived to escape promotion to the papal chair, but was induced by Pius V. (1605) to hold an important place in the Vatican, where he remained until the time of his death, which took place in the novitiate-house of the

Jesuits, Sept. 17, 1621. In his work, *De Potestate Pontificis in Temporalibus* (On the Pope's Power in Secular Matters), he introduced the doctrine that the pope must be held as supreme over all kings. On this account the book was condemned as treasonable in Paris, Venice, and Mentz. His chief work contains the disputations held in the Jesuits' college at Rome, 1576–81, *Disputationes de Controversiis Fidei adversus hujus Temporis Hereticos* (3 vols., Rome, 1581; 4 vols., Prague, 1721; 4 vols., Mayence, 1842). These disputations are regarded by Catholics as the best arguments for their tenets. There can be no question of their merits with regard to erudition and adroitness in controversy; but as Gerhard, in his *Bellarminus Orthodoxias Testis* (Jena, 1651–83), and Dallæus have shown, many of the conclusions are far from being sound or logical. Industry, clearness, and acuteness are the chief merits of Bellarmine's great work; but it is seriously lessened in value by subtility, forced conclusions, and a very defective exegesis—faults which have long been evident to enlightened Catholic writers themselves. Among his other writings, the most able is the *Christianæ Doctrinæ Applicatio*, originally written in Italian, and now translated into all the European languages. Pope Urban VIII., at the instigation of the Jesuits, declared Bellarmine to be a "faithful servant of God;" but his canonization as a saint has hitherto been opposed. Complete editions of his works have been published at Venice, 5 vols., 1721; and Cologne, 7 vols., 1619. His life was written in Italian by the Jesuit Fuligatti (Rome, 1624); and translated into Latin by Petra Sancta (Liege, 1626).

BELLA'RY, a district of British India in the presidency of Madras, bounded on the n. by the Nizam's territories, on the e. by Cuddapah, on the s. by Mysore, and on the w. by Dharwar. With an area of 11,007 sq.m., it extends in n. lat. between 13° 40′ and 15° 58′; and in e. long. between 75° 44′ and 78° 19′. Pop. '72, 1,663,006. The peculiarities of the district are connected with its situation. Elevated on the e. slope of the w. Ghauts, B. enjoys so healthy a climate, that it has been officially recommended as the site of a sanatorium for the neighboring provinces. Screened by the Ghauts from the s.w. monsoon, and protected against the n.e. one by its distance from the bay of Bengal, B. receives, on an average, less rain than any other portion of southern India—the annual fall ranging between about 12 in. and about 26 inches. Hence all its subordinate streams become, in the dry season, mere expanses of sand, which, excepting when bound together by the growth of the nuth-grass, is apt to encroach from year to year, like a glacier, over the bordering grounds. B., in fact, may in a great measure be said to be habitable through artificial means. Irrigation, though rude, is yet ingenious; dug wells amount to 22,000; of tanks there are 1400; and weirs or dams of huge stones, to the number of 331, cross the various watercourses, so as to form, after the rains, so many reservoirs.

BELLA'RY, the chief t. of the above district, is situated about 330 m. s.e. of Bombay, and 270 n.w. of Madras. Lat. 15° 8′ n., and long. 76° 59′ e. As one of the principal military stations in the presidency of Madras, it is connected by good roads with Belgaum, Bangalore, Hyderabad, and Madras itself. The fort stands on a rock two miles round, and 450 ft. high; and is supplied with water from tanks excavated in the solid granite. Besides the fort and adjacent cantonments, B. contains a native town, which numbers about 52,000 inhabitants.

BELLAY, JOACHIM DU, 1524–60; an eminent French poet. His youth was humble, and he was unknown until, at the age of 24, he met Ronsard, when a mutual friendship at once began. He joined the six poets who, under Dorat, were forming the "Pleiad," a society for the creation of a French school of renaissance poetry, and Bellay's first contribution was a prose volume, the *Defense and Illustrations of the French Language*, a remarkably strong piece of criticism. A year later he published the *Recueil de Poesie*, and a collection of love sonnets in the manner of Petrarch. In 1550, B. was sent to Rome, where he fell in love with a married lady, and to her addressed much of his best poetry. At last he won her, and his Latin poems end in rapturous delight. He was recalled to France and made a canon in Notre Dame, Paris. Thenceforward his brief life was one of social trouble but of literary activity. Finally, in 1560, when just nominated to be archbishop of Bordeaux, he suddenly died, and was buried in Notre Dame. Like Ronsard, he was very deaf. B. was long called the French Ovid. Spenser translated many of his sonnets into English.

BELL-BIRD, *Casmarynchus carunculata*, a bird found in some of the warm parts of South America, remarkable for the metallic resonance of its cry, which resembles the tolling of a bell, with pauses varying from a minute to several minutes. This bird belongs to a genus nearly allied to the cotingas (q.v.) and wax-wings (q.v.), but characterized by a very broad and much depressed bill, soft and flexible at the base, and hard towards the extremity. It is about the size of a jay; the male is of snow-white plumage, and from his forehead rises a strange tubular appendage, which, when empty, is pendulous, but which can be filled with air by a communication from the palate, and then rises erect to the height of nearly 3 inches. He generally takes his place on the top of a lofty tree, and his tolling can be heard to the distance of 3 miles. It resounds through the forest, not only at morning and evening, but also at midday, when the heat of the blazing sun has imposed silence on almost every other creature.

BELL, BOOK, AND CANDLE. The excommunication by B., B., and C. is a solemnity belonging to the church of Rome. The officiating minister pronounces the formula of excommunication, consisting of maledictions on the head of the person anathematized, and closes the pronouncing of the sentence by shutting the book from which it is read, taking a lighted candle and casting it to the ground, and tolling the bell as for the dead. This mode of excommunication appears to have existed in the western churches as early as the 8th century. Its symbolism may be explained by quoting two or three sentences from the conclusion of the form of excommunication used in the Scottish church before the reformation: "Cursed be they from the crown of the head to the sole of the foot. Out be they taken of the book of life. And as this candle is cast from the sight of men, so be their souls cast from the sight of God into the deepest pit of hell. Amen." The rubric adds: "And then the candle being dashed on the ground and quenched, let the bell be rung." So, also, the sentence of excommunication against the murderers of the archbishop of Dublin in 1534: "And to the terror and fear of the said damnable persons, in sign and figure that they be accursed of God, and their bodies committed into the hands of Satan, we have rung these bells, erected this cross with the figure of Christ; and as ye see this candle's light taken from the cross and the light quenched, so be the said cursed murderers excluded from the light of heaven, the fellowship of angels, and all Christian people, and sent to the low darkness of fiends and damned creatures, among whom everlasting pains do endure."

BELLE-ALLIANCE, the name of a farm in the province of Brabant, Belgium, 13 m. s. of Brussels. It has become famous as the position occupied by the center of the French army in the battle of Waterloo, June 18, 1815. The Prussians gave the name Belle-Alliance to this decisive battle; the French named it from Mont-Saint-Jean, the key of the British position, about 2 m. to the n.; but the English name, Waterloo (q.v), taken from the village where Wellington had his head-quarters, is now commonly used.

BELLECHASSE, a co. of Canada, extending from the border of Maine to the St. Lawrence; 720 sq.m.; pop. '71, 17,637. The chief products are maple sugar, oats, flax, and hay. Chief town, St. Michel.

BELLE DE NUIT (Fr., beauty of the night), a name given to certain tropical species of *convolvulaceæ*, with extremely beautiful and fragrant flowers, which open only during the night. The species to which perhaps the name more particularly belongs, is *calonyction bona nox*, a native of the forests of the West Indies, and of tropical America, with twining stem, spiny branches, heart-shaped leaves, and exquisitely beautiful white flowers of 5 or 6 in. in diameter, which are produced in large many-flowered corymbs.

BELLEFONTAINE, the seat of justice of Logan co., O., 55 m. n.w. of Columbus, on the highest ground in the state; reached by the Cincinnati, Sandusky, and Cleveland railroad; pop. '70, 3182. It has some important manufactures.

BELLEFONTE, a t. in Pennsylvania, seat of justice of Center co., 87 m. w. of Harrisburg, at the base of Bald Eagle mountain, on the Bald Eagle valley railroad, has a number of manufactories, and is a summer resort for its springs and scenery. Pop. '70, 2655; in '80, 3030.

BELLEGARDE, a hill-fortress of France, in the department of Pyrénées Orientales. It is situated on the Spanish confines on the road from Perpignan to Figueras, and in the pass between Col de Portus on the e., and Col de Panzias on the west. Here the French, under Philip III., were defeated by Peter III. of Aragon in 1285. In the 14th c., B. consisted only of a fortified tower. It was captured by the Spaniards in 1674, and again by the French under marshal Schomberg in 1675. After the peace of Nimeguen, 1678–79, a regular fortress, with five bastions, was erected here by order of Louis XIV. In 1793, it was blockaded and taken by the Spaniards under Ricardos, but was retaken by the French in the following year.

BELLE ISLE, an island in the Atlantic, about midway between the n.w. of Newfoundland and the s.e. of Labrador, in lat. 52° n., and long. 56° w. Although on the parallel of Essex in England, it yields little but potatoes and ordinary vegetables. It is chiefly known as giving name to the adjacent strait on the s.w., which, separating Labrador from Newfoundland, forms the most northerly of the three channels between the gulf of St. Lawrence and the open ocean.

BELLE ISLE, CHARLES LOUIS AUGUSTE FOUQUET, Duc de, 1684–1761; a French soldier and statesman, who became lieut.gen. in 1732, and negotiated the treaty, three years later, whereby Lorraine was united to France. He was minister to Germany, and labored to bring the elector of Bavaria to the throne. In the war against Austria he captured Prague, but did not hold it. In 1745, he was a prisoner to the English, but was exchanged, and rose in promotion to duke, peer, member of the academy, and lastly minister of war.

BELLE ISLE, NORTH, an island at the entrance of Belle Isle straits, 52° n., 55° 20′ w., 16 m. from the coast of Labrador. It has a surface of about 15 sq.m., and a harbor for small vessels.

BELLE ISLE, SOUTH, an island off the Newfoundland coast, 16 m. from Canada bay, 51° n., 55° 35′ w. It is about as large as Belle Isle, North.

BELLE ISLE, STRAIT OF, the northern entrance to the gulf of St. Lawrence, running about 80 m. s.w. between Newfoundland and Labrador. Its width is about 12 m., but the navigation is difficult. On the n.w. side are several small bays.

BELLEISLE-EN-MER, an island belonging to France in the department Morbihan, in the Atlantic, 8 m. s. of Quiberon point. Its length is 11 m., and its greatest breadth 7. Pop. '72, 10,894, chiefly engaged in pilchard-fishing. Salt is made on the island. B. is a place of considerable antiquity. The chief town is *Palais* (pop. 2260), a seaport and fortified place. In the 9th c., B. came into the possession of the count of Cornouailles, who bestowed it on the abbey of Redon, afterwards on the abbey of Quimperlé. In the 13th c., the monks of Quimperlé ceded the island to Charles IX., who gave it as a marquisate to the marshal de Retz, who fortified it. His successor sold the island in 1658 to Fouquet, intendant of finance, who further improved and strengthened it. His grandson, the celebrated marshal Belleisle, ceded the island to Louis XV. in exchange for the comté Gisors, 1718. In 1761, it was captured by the English fleet under Keppel, and restored in 1763.

BELLENDEN (BALLANTYNE), JOHN, archdeacon of Moray, a Scottish writer in the reigns of James V. and queen Mary, was born towards the close of the 15th c., somewhere in the e. of Scotland, for in the records of the university of St. Andrews he is entered thus; "1508, *Jo. Ballentyn nac. Landoniæ.*" He completed his education at the university of Paris, where he took the degree of D.D. Bellenden is best remembered by his translation of Boece's *Scotorum Historiæ* (done in 1533), and of the first five books of Livy (also done in 1533), interesting as specimens of the Scottish prose of that period, and remarkable for the ease and vigor of their style. To both of these works are prefixed poetical *prohemes* or prologues. Bellenden's *Croniklis of Scotland* professes to be a translation of Boece, but it is a very free one, and contains numerous passages not to be found in the original, so that it is in some respects to be considered almost an original work. The author enjoyed great favor for a long time at the court of James, at whose request he executed the translations. As the reward of his performances, he received grants of considerable value from the treasury, and afterwards was made archdeacon of Moray and canon of Ross. Becoming involved, however, in ecclesiastical controversy, he left his country, and, according to Bale and Dempster, went to Rome, where he died about 1550. The translation or "traductioun" of Livy was first published in 1822 by Mr. Thomas Maitland (afterwards lord Dundrennan), uniform with his edition of the *Croniklis* in the previous year (Edin., 2 vols., 4to).

BELLENDEN, WILLIAM, a Scottish author in the time of queen Mary and James VI. His personal history is meager and obscure; all that we know being the testimony of Dempster (*Hist. Eccl.*) that he was a professor in the university, and an advocate in the parliament of Paris, and that he was employed in that city in a diplomatic capacity by queen Mary, and also by her son, who conferred on him the appointment of master of requests. His first work, entitled *Ciceronis Princeps*, etc., was published at Paris in 1608; his next, *Ciceronis Consul, Senator, Populusque, Romanus*, in 1612. Both these works are compilations from the writings of Cicero. His next work, *De Statu Prisci Orbis*, appeared in 1615, and consists of a condensed sketch of the history and progress of religion, government, and philosophy in ancient times. These three works he republished in a collected form the year after, under the title *De Statu, Libri tres*. His crowning labor, *De Tribus Luminibus Romanorum*, was published after his death. The "three luminaries" were Cicero, Seneca, and Pliny, out of whose works he intended to compile, on the same plan as his previous works, a comprehensive digest of the civil and religious history, and the moral and physical science of the Romans. The first of these only was completed, and forms a remarkable monument of B.'s industry and ability. "B.," says Mr. Hallam, "seems to have taken a more comprehensive view of history, and to have reflected more philosophically on it than perhaps any one had done before." B.'s works furnished the materials for Dr. Middleton's *Life of Cicero*, though that learned divine abstains from any allusion to the forgotten Scot from whom he plundered wholesale. Wharton first denounced the theft, which was afterwards made clear by Dr. Parr in his edition of *De Statu, Libri tres*, published in 1787.

BELLEROPHON, a genus of univalve shells, known only as a fossil. Montfort, who established the genus, placed it among the chambered cephalopoda. It was subsequently associated with the living argonaut, but is now generally considered as a genus of De Blainville's nucleobranchiata (q.v.), having as its nearest ally the genus *Atlanta;* from which, however, it differs in having a strong shell. The shell of the B. is symmetrically convolute, with few and occasionally sculptured whorls, globular or discoidal, and having a dorsal keel, which terminates in a deep notch in the sinuous aperture. It is a paleozoic organism, extending from the lower Silurian to the carboniferous series. Seventy species have been described.

BELLEROPHON (originally called HIPPONOUS) was the son of the Corinthian king Glaucus, and Eurymede, daughter of Sisyphus. Other accounts make Neptune his father. Having accidentally killed his brother, B. fled to his relative Prœtus, king of Argos, by whom he was hospitably received and protected; but Anteia, the spouse of Prœtus, having become enamored of him, and he, like Joseph, having declined her over-

tures, she revenged herself after the manner of Potiphar's wife. This induced Prœtus to send his guest away to Iobates, king of Lycia, to whom B. carried a sealed message. After being entertained nine days at the court of Lycia, B. delivered the letter, which contained a request that Iobates would cause the youth to be slain. This, however, Iobates was reluctant to do in a direct way, as B. was his guest. He consequently imposed upon B. the seemingly impossible task of slaying the formidable Chimæra (q.v.). B., mounted on the winged steed Pegasus (given to him by Pallas), ascended into the air, and succeeded in slaying the monster with his arrows. Afterwards, he was sent by king Iobates against the Amazons, whom he defeated. On his way home he destroyed an ambuscade of Lycians, which Iobates had set for his destruction. That monarch now thought it useless to attempt his death, and as a sort of recompense, gave the hero in marriage his daughter Philonoë, by whom he had three children—Isander, Hippolochus, and Laodameia; such at least is the story as told by Apollodorus, who here concludes. Homer relates that he at last drew on himself the hatred of the gods, and wandered about in a desolate condition through the Aleïan field. Pindar relates that B. on Pegasus endeavored to mount to Olympus, when the steed, maddened by Jove through the agency of a gadfly, threw his rider, who was stricken with blindness. B.'s adventures were a favorite subject of the ancient artists. Sculptures have recently been discovered in Lycia which represent him vanquishing the Chimæra.

BELLES-LETTRES, a term adopted from the French into the English and various other languages. It is generally used in a vague way to designate the more refined departments of literature, but has in fact no precise limits. In English usage it is synonymous with another vague expression, *polite literature*, including history, poetry, and the drama, fiction, essay, and criticism.

BELLEVILLE, a t. of France, in the department of the Seine, forming a suburb of Paris, and inclosed by the new fortifications. It has manufactories of cashmeres, varnished leather, articles of polished steel, chemical stuffs, etc. There are springs at B. which have supplied Paris with water from a very early date, and it has tea-gardens and other places of amusement much resorted to by the Parisians. Population over 70,000.

BELLEVILLE, chief t. of the co. of Hastings, Ontario, Canada, situated on the bay of Quinté, lake Ontario, and on the Grand Trunk railway of Canada, 48 m. w. from Kingston. It is a very thriving town. Here are several iron-foundries, manufactories, and saw-mills. Pop. '71, 7305.

BELLEVILLE, a city in St. Clair co., Ill., 14 m. e. of St. Louis, Mo., on the St. Louis, Belleville and Southern, and Illinois and St. Louis railroads; pop. '70, 8,146. It is in a productive region, on high ground; has a Roman Catholic academy; there are coal-mines in the vicinity. A large proportion of the population are Germans.

BELLEY, a t. of France in the department of Ain, is a place of great antiquity, and was at one time strongly fortified. The finest lithographing stones in France are procured here. Pop. '76, 4105.

BELL-FLOWER. See CAMPANULA.

BELLING, WILHELM SEBASTIAN VON, 1719–79; a Prussian soldier, who, with a small force, coped with the whole Swedish army. He was a maj.gen. in 1762, and lieut. gen. in 1776. He was one of the bravest of hussars, and a favorite of Frederick the great.

BELLINGHAM, RICHARD, 1592–1672; b. England, governor of Massachusetts, elected in 1641 by six majority over John Winthrop. He was chosen twice afterwards, 1654 and 1666, and held the office until his death. When quite old he married a second wife, performing the service himself, but, as the publication of the bans was irregular, he was prosecuted for violating the law, was tried before himself as judge, and by himself acquitted. His sister Anne was a victim to the Salem persecution of witches.

BEL'LINI, the name of a Venetian family which produced several remarkable painters. The earliest was JACOPO B., who d. in 1470. He was a pupil of the celebrated Gentile da Fabriano, and one of the first who painted in oil. His eldest son, GENTILE B., b. 1421, d. 1501, was distinguished as a portrait-painter, and also as a *medailleur*. Along with his brother, he was commissioned to decorate the council-chamber of the Venetian senate. Mohammed II., having by accident seen some of his works, invited Gentile to Constantinople, employed him to execute various historical works, and dismissed him laden with presents. The "Preaching of St. Mark" is his most famous achievement. His more celebrated brother, GIOVANNI B., b. 1422, d. 1512, was the founder of the older Venetian school of painting, and contributed greatly to its progress. His works are marked by naïveté, warmth, and intensity of coloring. His best works are altar-pieces. His picture of the "Infant Jesus" slumbering in the lap of the Madonna, and attended by angels, is full of beauty and lively expression. His "Holy Virgin," "Baptism of the Lord," and "Christ and the Woman of Samaria," are also much admired. Among his numerous pupils the most distinguished were Giorgione and Titian.

BELLI'NI, LORENZO, 1643–1703; a Florentine anatomist and physician, who studied medicine under Redi. He was professor of anatomy at Pisa, and in Florence was

physician to the grand duke Cosmo, and also senior consulting physician to pope Clement XI.

BELLI'NI, VINCENZO, one of the most popular modern opera composers, was b. at Catania, in Sicily, Nov. 1, 1802, and d. at Puteaux, near Paris, Sept. 24, 1835. He received his early education at the conservatory of Naples, and was subsequently instructed in composition by Tritto and Zingarelli. After making some attempts, without much success, in instrumental and sacred music, he brought forward, in 1825, the opera *Andelson e Salvina*, which was played in the small theater of the royal college of music (Naples). Another opera, *Bianco e Gernando*, was given in the theater St. Carlo (1826) with such success that, in 1827, B. was commissioned to write a piece for *La Scala* at Milan. This opera, *Il Pirata*, was the first which carried the composer's name beyond Italy. It was followed with equal success by *La Straniera*, 1829, and by *I Capuletti ed i Montecchi*, written for the theater of Venice, 1830, which was the culmination of the fame of B., though it by no means exhausted his productive powers. *La Sonnambula* and *Norma* appeared in 1831, and *Beatrice di Tenda* in 1833. In the same year the composer went to Paris, where he became acquainted with other forms of music beside the Italian. He was received with great applause in London, and after his return to Paris, wrote his opera *I Puritani*, which shows the influence of the French school of music, but without servile imitation. At an early age the career of B. was interrupted by death, before the composer had fully developed his powers. He was the most genial and original of all the followers of Rossini, and though inferior to his master in exuberance of fancy, is superior in carefulness and finish, especially in the due subordination of instrumental decorations to vocal melody. In private he was highly esteemed for the purity and affectionateness of his character.

BELLINZO'NA, or BELLENZ, a t. of Switzerland, in the canton of Tessin or Ticino, on the left bank of the river of that name, and the seat of the provincial government, alternately with Lugano and Locarno. It is guarded by three old castles, and completely commands the passage of the valley in which it is situated. In former times, it was considered a place of great military importance, and was the scene of frequent conflicts between the Italians and Swiss; the latter of whom finally made themselves masters of it about the beginning of the 16th century. As an entrepôt for the merchandise of Germany and Italy, it is now a place of considerable commercial importance, though the population is but small—(1870) 2501.

BELLIS. See DAISY.

BELLMAN, KARL MIKAEL, 1740–95; the great lyric poet of Sweden. Like Pope, he was a precocious rhymer, and at 17 published a book, a translation from the German. In 1760, appeared *The Moon*, a satirical poem, and from 1765 to 1780 he was writing his *Fredman's Epistles* and *Fredman's Songs*. The mode of composition of these works was surprising. In the presence of none but confidential friends, B. would take a zither, shut his eyes, announce that the god was about to visit him, and go on improvising an ode in praise of love or wine, singing it to a tune of his own construction. While the verses which he wrote in the usual way are tame and without character, the compositions made in this state of ecstasy glow with color, ring with melody, and bear the impress of individual genius. The odes of B. breathe a passionate love of life; he is amorous of existence, and keen after pleasure; but after all the frenzy there is a pathos, a yearning that is sadder than tears. He is sometimes frantic, sometimes gross, but always ready at his wildest moments to melt into tears. B. had a grand manner, a fine voice, and a great gift of mimicry. He was a favorite companion of king Gustavus III. Several statues of B. are in existence, the best being a colossal bust in the public gardens at Stockholm, erected by the Swedish academy.

BELL OF A CAPITAL is the capital of a pillar denuded of the foliage, in which case it resembles the form of a bell reversed.

BELLO'NA, the goddess of war among the Romans, was described by the poets as the companion, sister, wife, or daughter of Mars; she was also represented as armed with a bloody scourge, and as inspiring her votaries with a resistless enthusiasm in battle. In the war with the Samnites, the consul Appius Claudius vowed a temple to B., which was erected afterwards on the field of Mars. In this temple the senate gave audience to embassies from foreign powers, and also to consuls who had claims to a triumph which would have been nullified by entrance into the city. The priests of the goddess were styled *Bellonarii*, and practiced sanguinary rites: such as cutting their own arms or feet, and offering (or even drinking) the blood in sacrifice. This was especially done on the *dies sanguinis* (day of blood) Mar. 24.

BELLOT, JOSEPH RENÉ, a lieut. in the French navy, who perished in the arctic regions, in search of sir John Franklin, was b. in Paris, 18th Mar., 1826, and educated at Rochefort, in the naval school. In the French expedition against Tamatave, in 1845, he gave proof of so much courage and presence of mind, that the cross of the legion of honor was conferred on him before he had attained his twentieth year. In May, 1851, he joined the expedition then preparing in England for the polar regions, in search of sir John Franklin, and sailed in the *Prince Albert*, Kennedy commander, sent out by lady Franklin. Distinguished by his noble daring and spirit of enterprise, he took part

in several explorations. In one of these he made an important geographical discovery, to which his name was given—*Bellot strait* (q.v.). On his return, he was promoted to the rank of navy lieutenant. In the expedition fitted out by the British admiralty, under capt. Inglefield, he sailed as a volunteer, in H.M.S. *Phœnix;* but never returned, having been carried by a violent gust of wind, 21st Mar., 1853, into a deep crack in the ice on which he was traveling. A considerable sum was subscribed in England for a monument to his memory. His *Journal of a Voyage to the Polar Seas made in Search of Sir John Franklin* in 1851–52, edited, with a notice of his life, by M. Julien Lemer, 2 vols., was published at Paris in 1854. English translation, Lond., 1855.

BELLOT STRAIT, the passage which separates North Somerset from Boothia Felix, and connects Prince Regent's inlet with Peel strait or sound, or, in M'Clintock's new nomenclature, Franklin channel. Its e. entrance was discovered by Kennedy during his search for Franklin, and he, assuming the continuity of the opening, classified it accordingly, naming it after his lamented companion Bellot. After four unsuccessful attempts, it was explored for the first and perhaps last time by M'Clintock on his crowning voyage. It is about 20 m. long, and, at its narrowest part, about 1 m. wide, running pretty nearly on the parallel of 72°, between granite shores which, everywhere high, rise here and there to 1500 or 1600 feet. Through this funnel both the winds and the waters have full play; the latter, permanent currents and flood-tides alike, coming from the west. To the most northerly point on the s. shore, M'Clintock has given the name of Murchison promontory, which, at least unless other straits like B. S. be found towards the isthmus of Boothia, must be also the most northerly point of the new continent. See Barrow, Point.

BELLOY, Pierre Laurent Buirette, one of the first French dramatists who ventured to introduce on the stage native, instead of Greek, Roman, or other outlandish heroes. He was b. at St. Flour, in Auvergne, 17th Nov., 1727, and d. 5th Mar., 1775. His father having died while B. was young, his uncle took him under his protection, and educated him for the law; but the seductions of the drama proved irresistible, and the opposition which he encountered in the cultivation of his theatrical talent ultimately determined him to leave his adopted home. Under the name of Dormont de B., he performed on various northern boards, and was much esteemed for his private worth. For some years he resided at St. Petersburg, where the empress Elizabeth interested herself in him. In 1758, he returned to France, to superintend the "bringing out" of his tragedy *Titus*, trusting that its success would reconcile his family to him. In this, however, he was disappointed, for the piece proved a failure, being only a feeble imitation of *Metastasio*, and he returned to St. Petersburg. After the death of his uncle, he again visited France, and obtained a decided success by his tragedy of *Zelmire*. In 1765 appeared *Le Siége de Calais*, which was immensely popular, and is even yet held in estimation; and in 1771, *Gaston and Bayard*, which secured for him an entrance to the French academy. But of all his productions, the one which has longest retained a place in the *répertoire* of the stage, though it was far from popular at first, is *Pierre le Cruel*. B.'s dramas are not by any means wanting in theatrical effectiveness, but are marred by great incorrectness. They have been collected and edited by Gaillard (6 vols., Par., 1779).

BELLOWS. See Blowing-machines.

BELLOWS, Henry Whitney, s.t.d., ll.d., b. Mass., 1814; a graduate of Harvard, and of Cambridge divinity school; in 1838, pastor of the first Congregational (Unitarian) church of New York, and still officiating there in 1880. Dr. B. was instrumental in establishing the *Christian Enquirer* in 1846. He has published a number of lectures and pamphlets, among the more notable his *Phi Beta Kappa Oration*, a *Defense of the Drama*, *Treatment of Social Diseases*, *Christian Doctrine*, *The Old World in its New Face*, etc. With an excellent literary taste and skill he combines practical and administrative ability. He did excellent service as presiding officer of the sanitary commission during the war of the rebellion.

BELLOWS FALLS, a village in Vermont, on the Central Vermont and Cheshire railroads, and on the Connecticut river, 52 m. s.s.e. of Rutland. There is a bridge across the river, and the village is noted for manufactures. The water-power is supplied by the falls, which with several rapids have a descent of 44 feet. These falls were the subject of absurd exaggeration by Samuel Andrew Peters, the tory clergyman of the church of England who wrote the notorious history of Connecticut. Pop. '80, 2228.

BELLOWS FISH, or Trumpet Fish, *Centriscus scolopax*, found in the Mediterranean; it is spiny-rayed, of the tufted-gilled order, with a tubular snout and small mouth without teeth at the end; body oval; spinous dorsal fins; ventrals united. It feeds by suction on minute crustacea. Its flesh is considered palatable.

BELL ROCK, or Inch Cape, a reef of old red sandstone rocks in the German ocean, 12 m. s.e. of Arbroath, and nearly opposite the mouth of the Tay. The reef is 2000 ft. long; at spring-tides, part of it is uncovered to the height of 4 ft.; and for 100 yards around, the sea is only 3 fathoms deep. It was formerly a fruitful cause of shipwreck, and, according to tradition, the abbot of Aberbrothwick (Arbroath) placed a bell on it, "fixed upon a tree or timber, which rang continually, being moved by the sea, giving notice to the saylers of the danger." This tradition has been embodied by Southey in

his well-known ballad of *The Inchcape Rock*. A light-house, designed by Robert Stevenson, engineer to the commissioners of northern light-houses, was commenced in 1807, and completed on the reef in 1811, and a revolving red and white light exhibited. The structure is 115 ft. high, is 42 ft. in diameter at base, and 15 at top, is solid for the first 30 ft. upwards, 15 ft. of which is under water at high tide, and cost upwards of £60,000.

BELLS, on shipboard, is a term having a peculiar meaning, not exactly equivalent to, but serving as a substitute for "time" or "o'clock" in ordinary land-life. The day, or rather the night, is divided into watches or periods, usually of four hours' duration each; and each half-hour is marked by striking on a bell. The number of strokes depends, not on the hour, according to ordinary reckoning, but on the number of half-hours which have elapsed in that particular watch. Thus, "three bells" is a phrase denoting that three half-hours have elapsed, but it does not in itself show to which particular watch it refers. Capt. Basil Hall, in his *Fragments of Voyages and Travels*, while treating of Sunday usages on board ships of the royal navy, mentions one or two phrases illustrative of this mode of time-reckoning. While the sailors are at breakfast on Sunday morning, "the word is passed to 'clean for muster,' and the dress is specified according to the season of the year and climate. Thus, at different seasons is heard: 'Do you hear there, fore and aft! clean for muster at five bells! duck-frocks and white trousers!'—or, 'Do you hear there, clean shirt and a shave for muster at five bells!'" A ship's bell is usually hung to the beam of the forecastle, but occasionally to a beam near the mizzen-mast. Sometimes, in foggy weather, as a warning to other ships, the bell is struck to denote that the ship is on a starboard-tack; leaving the port-tack to be denoted by the beat of a drum. See WATCH ON SHIPBOARD.

BELLU'NO (the ancient *Bellunum*), a city of Venetia, northern Italy, on the right bank of the Piave, and 51 m. n. of the city of Venice. It is walled, is the seat of a bishop, has a handsome cathedral, hospital, public library, fine aqueduct, etc. It has a trade in timber, and manufactories of silks, hats, leather, and earthenware. Pop. 7000.

BELLUR', a large t. in the territory of Mysore, India, 40 m. n. from Seringapatam, with a fort, which has a strong mud rampart and ditch. The town itself was formerly protected by a similar rampart, which is now ruinous.—Another town of the same name, also in Mysore, is situated 60 m. w.n.w. from this, a mile from the w. bank of the river Yagachi, or Bhadri, one of the head-waters of the Cavery.

BEL-MERODACH. See MERODACH.

BELMONT, a co. in e. Ohio, on the West Virginia border; intersected by a branch of the Cleveland and Pittsburgh, and the Baltimore and Ohio railroads; 525 sq.m.; pop. '70, 39,714; in '80, 50,014. The surface is hilly; soil good, producing grain, tobacco, potatoes, sorghum, dairy products, and wool. Bituminous coal is found. Cc. seat, St. Clairsville.

BELMONT, a village in Missouri, on the Mississippi river, opposite Columbus, Ky. Here, Nov., 1861, a sharp conflict for possession of the place occurred between the union forces under gen. Grant, and the confederates under gen. Pillow. As B. was commanded by the guns of gen. Polk at Columbus, gen. Grant could not hold it, and fell back on his boats. Eighty-four union men and about as many confederates were killed.

BELOIT, a city of Wisconsin, U. S., on Rock river, on the Southern State railway, 75 m. s.w. of Milwaukee, built on two plains, one 70 ft. above the other, with broad shaded streets, groves, and handsome residences. It has a college, 9 fine churches, several flour and paper mills, foundries, and manufactories of agricultural implements, etc. Pop. '70, 4396.

BELOIT COLLEGE, at Beloit, Wis.; was organized in 1847, under Congregational and Presbyterian patronage. It has an endowment of $140,000, and an annual income of $15,000. The buildings are six in number, including chapel, memorial hall, and gymnasium, standing within a campus of 24 acres, on the Rock river. The laboratory and apparatus are valued at $3000; the geological and mineral cabinet at $2500. The library contains about 10,000 volumes. The number of professors (1880) is 8; other instructors, 2; students, 140; alumni, 272. Connected with the college and under the care of the faculty are collegiate, classical, philosophical, scientific, preparatory, and miscellaneous departments. Gymnastic exercises are maintained daily. The president is Aaron L. Chapin, D.D.

BEL'OMANCY (Gr. *belos*, an arrow; *manteia*, prophecy), a mode of divination by arrows, practiced among the Arabs and other nations of the east. A number of arrows being shot off with sentences written on labels attached to them, an indication of futurity is sought from the inscription on the first arrow found. This is only one of many ways of divining by arrows. See AXINOMANCY, DIVINING-ROD.

BELON, PIERRE, a celebrated French naturalist, was b. in 1517 at Soulletière, in the department of Sarthe. He studied medicine at Paris, and subsequently traveled through Germany. In 1546, he left France, and visited Greece, Asia Minor, Egypt, and Arabia. He returned in 1549, and in 1553 published the results of his travels, in a work entitled *Observations on several Singular and Memorable Things discovered in Greece, Asia, Judea,*

Egypt, Arabia, and other Foreign Countries. Charles IX. gave him apartments in the Château of Madrid, a sumptuous edifice which Francis I. had constructed in the Bois de Boulogne. Here he resided till his tragic death in April, 1564. He was murdered by robbers when gathering herbs at a late hour in the evening in the Bois de Boulogne.

Besides the valuable work already mentioned, B. published, in 1551, *A Natural History of Strange Sea-fish, with a correct Representation and Account of the Dolphin, and several others of that Species*, which contains, among other things, an exact description of the dolphin, and the earliest picture of a hippopotamus in any European book; in 1555, *A Natural History of Birds*, which is often quoted by Buffon, and acknowledged to be the most important treatise on ornithology of the 16th c.; in 1558, an elaborate and interesting work on arboriculture, in which he gave a list of the exotic trees which it would be useful to introduce into France. Besides these, B. wrote several other treatises of trees, herbs, birds, and fishes.

BEL'ONE. See GARFISH.

BELOOCHISTAN', or BALUCHISTAN, a country of southern Asia, bounded on the n. by Afghanistan, on the e. by Sinde, on the s. by the Arabian sea, and on the w. by the Persian province of Kerman. B. corresponds in general with the ancient Gedrosia, excepting that the latter name appears to have extended to the Indus, while the former nowhere reaches that river. B. stretches in n. lat. between 24° 50′ and 30° 20′, and in e. long. between 61° and 68° 40′, having a coast-line of 500 miles. The area is about 106,000 sq.m., and the population is variously estimated at from 400,000 to 1,000,000. Though it was anciently a part of Persia, yet its modern relations connect it rather with India, more particularly since Sinde and Moultan have fallen under the dominion of the English. In the bygone ages of the overland invasions of Hindustan, the Gedrosian or Beloochee desert formed, as it were, a barrier for the lower Indus, constraining every assailant, from Alexander downwards, to prefer the less barren, though perhaps more rugged route through Afghanistan into the Punjab—a preference strengthened by Alexander's direful experience in returning from the Indus along the coast. The surface is generally mountainous, more especially towards the n., the peak of Takkatu being said to be 11,000 ft. high. Even the bottoms of some of the valleys have an elevation of 5700 ft.; and the capital, Kelat, situated on the side of one of them, is 6000 ft. above the level of the sea. The rivers are inconsiderable, unless after heavy rains: even the largest of them, the Dusti, after a course of about 1000 m., has been found to be only 20 in. deep, and 20 yds. wide at its mouth. The pastures, as may be supposed, are poor, so that there are few cattle: sheep and goats, however, are numerous. The dromedary is the ordinary beast of burden, and it is only in the n.w., towards Kerman, that horses are bred. Wherever there is a sufficiency of water, the soil is productive—the lowlands yielding rice, sugar, cotton, indigo, and tobacco; and the higher grounds, wheat, barley, madder, pulse, and European fruits. In the sandy waste of Mekran, where Alexander's army suffered its severest hardships and privations, the only valuable product is the date. The minerals are copper, lead, antimony, iron, sulphur, alum, and sal-ammoniac; and the manufactures are skins, woolens, carpets, and tent-covers of goat's and camel's hair, and rude fire-arms. B. has but one seaport, Sonmeanee, near the frontier of Sinde. The trade is insignificant, being, such as it is, chiefly monopolized by Hindus. The chief peoples of B. are the distinct races of the Belooches and the Brahoes; all the inhabitants are Mohammedans of the Sunnite confession. Most of the e. provinces, which alone come into contact with British India, are under the authority of the khan of Kelat, who, with a revenue of about £30,000, maintains an army of 3000 men. This petty sovereign having acted treacherously towards the British during the Afghan campaign of 1839, his royal city was taken by storm in the same year. In 1840, it was abandoned; but, in 1841, it was again captured, for temporary occupation, by the British.

BELPAS'SO, a t. of Sicily, on the lower part of the southern slope of Mt. Etna, in the province and 8 m. n.w. from the town of Catania. Pop. about 7500. Below the town is an expanse of brown lava, but the surrounding country is generally rich and fruitful. A town called Mel Passo, from the abundance of honey in its neighborhood, stood not far from the site of the present town, but was destroyed by an eruption in 1669; when the inhabitants removed to a locality a few miles off, in the plain, and built a town of which the desolate remains are still to be seen, bearing the name of *Belpasso Vecchio;* malaria compelled them to leave it, and to return to the mountain-slope, notwithstanding its occasional dangers.

BELPER, a market t. of Derbyshire, England, on the Derwent; a station on the North Midland railway, 7 m. n. from Derby. It is well built, in great part of grit-stone, which is obtained in the neighborhood. One of the most conspicuous public buildings is a church, of recent erection, on an eminence above the town; the union workhouse is also worthy of notice, being a splendid building in the Elizabethan style of architecture. B. is, to a considerable extent, a town of recent growth, and owes its prosperity to the establishment of cotton-works here by Messrs. Strutt, one of whom was elevated to the peerage as lord Belper. In these works, a very great number of operatives are employed. The manufacture of silk and cotton hosiery is also largely carried on in Belper. Nail-making and the manufacture of brown earthenware also give employment to many of

the inhabitants. The surrounding country is rich in coal, iron, lead, and limestone. B. was at one time the residence of John of Gaunt, part of whose mansion still remains. Pop. '71, 8527.

BELSHAM, THOMAS, one of the ablest expounders of the Unitarian system of theology, was b. at Bedford in 1750. He was educated in the principles of Calvinism, and for some years officiated as pastor of the dissenting congregation and head of the theological academy at Daventry. These offices he resigned in 1789, on embracing Unitarian views, and shortly after received the charge of a new theological academy at Hackney, which in a few years collapsed for want of funds. Before its extinction, he succeeded Dr. Priestley in his pastoral charge, and in 1805 removed to London as the successor of Dr. Disney, where he continued till his death in 1829. Most of his works are controversial: his doctrine regarding the person of Christ represents the purely "humanitarian" view, as distinguished from the more nearly Arian sentiments of men like Channing. He published also a work on mental and moral philosophy, following Hartley, and a memoir of his predecessor, Theophilus Lindsey. His brother, William (b. 1752; d. 1827), was an active and voluminous writer of history and political tracts on the side of the Whigs.

BELSHAZ'ZAR, or BELSA'ZAR, was the last king of the Chaldean dynasty in Babylon. The name occurs only in the Old Testament, where it indicates either the person who is called by Herodotus Labynetos, or his son. For an account of the circumstances attending his overthrow, see the book of Daniel, Herodotus, etc.

BELSHAZZAR (*ante*). In regard to the supposed discrepancies between the Bible and such writers as Berosus and Herodotus, sir Henry Rawlinson has recently shown that those writers not only do not contradict, but explain and confirm the account given in the Scriptures. It appears that the eldest son of Nabonedus was Bel-shar-ezar, and was by his father admitted to a share in the government. Sir Henry says "we can now understand how Belshazzar may have been king in Babylon when the city was attacked by the combined forces of the Medes and Persians, and may have perished in the assault which followed, while Nabonedus, leading a force to the relief of the place, was defeated and obliged to take refuge in Borsippa, capitulating after a short resistance, and being subsequently assigned, according to Berosus, an honorable retirement in Carmania."

BELT (signifying Girdle), the name given to two straits, the GREAT and the LITTLE B., which, with the Sound, connect the Baltic with the Cattegat. The GREAT B., about 70 m. in length, and varying in breadth from 4 to more than 20 m., divides the Danish islands, Seeland and Laaland, from Fünen and Langeland. The LITTLE B. divides the island of Fünen from Jütland. It is equal in length to the Great B., but much narrower. Its greatest breadth is about 10 m., but it gradually narrows toward the n., until at the fort of Frederica it is less than a mile wide; thus the passage from the Cattegat into the Baltic is here easily commanded. Both the Belts are dangerous to navigation, on account of numerous sandbanks and strong currents; and therefore, for large vessels, the passage by the Sound (q.v.) is preferred.

BEL'TEIN, BEL'TANE, BEIL'TINE, or BEAL'TAINN, the name of a heathen festival once common to all the Celtic nations, and traces of which have survived to the present day. The name is derived from *tin* or *teine*, fire, and Beal or Beil, the Celtic god of light or sun-god, a deity mentioned by Ausonius (309–92 A.D.) and Tertullian (who flourished during the first half of the 3d c.), as well as on several ancient inscriptions, as Belenus or Belinus. B. thus means "Beal's fire," and belongs to that sun and fire worship which has always been one of the most prominent forms of polytheism. The great festival of this worship among the Celtic nations was held in the beginning of May, but there seems to have been a somewhat similar observance in the beginning of November (the beginning, and the end of summer). On such occasions, all the fires in the district were extinguished (while the system was in full force, even death was the penalty of neglect); the *needfire* (q.v.) was then kindled with great solemnity, and sacrifices were offered—latterly, perhaps, of animals, but originally, there can be little doubt, of human beings. From this sacrificial fire the domestic hearths were rekindled.

The earliest mention of B. is found by Cormac, archbishop of Cashel in the beginning of the 10th century. A relic of this festival, as practiced in some parts of the highlands of Scotland about the beginning of the 19th c., is thus described: "The young folks of a hamlet meet in the moors on the 1st of May. They cut a table in the green sod, of a round figure, by cutting a trench in the ground of such circumference as to hold the whole company. They then kindle a fire, and dress a repast of eggs and milk in the consistence of a custard. They knead a cake of oatmeal, which is toasted at the embers against a stone. After the custard is eaten up, they divide the cake in so many portions, as similar as possible to one another in size and shape, as there are persons in the company. They daub one of these portions with charcoal until it is perfectly black. They then put all the bits of the cake into a bonnet, and every one, blindfold, draws out a portion. The bonnet-holder is entitled to the last bit. Whoever draws the black bit is the devoted person, who is to be sacrificed to Baal, whose favor they mean to implore in rendering the year productive. The devoted person is compelled to leap three times over the flames." The leaping three times through

the fire is clearly a symbolical sacrifice, and there was doubtless a time when the victim was bound on the pile, and burned. See SACRIFICE.

It has been usual to identify the worship of the Celtic Beal with that of the Baal (q.v.) or Bel of the Phenicians and other Semitic nations. It is unnecessary, however, to go beyond the family of nations to which the Celts belong (see ARYANS), in order to find analogies either for the name or the thing. J. Grimm (*Deutsche Mythologie*, i. 208, 581) identifies the Celtic Beal not only with the Slavonic *Belbog* or *Bjelbog* (in which name the syllable *bel* or *bjel* means white, and *bog*, god), but also with the Scandinavian and Teutonic Balder (q.v.) or Paltar, whose name appears under the form of Baldag (the white or bright day), and who appears to have been also extensively worshiped under the name of Phol or Pol. The universality all over Europe in heathen times of the worship of these personifications of the sun and of light through the kindling of fires and other rites, is testified by the yet surviving practice of periodically lighting *bonfires* (q.v.). The more marked turning-points of the seasons would naturally determine the times of these festivals. The two solstices at midwinter (see YULE) and midsummer, and the beginning and end of summer, would be among the chief seasons. The periods of observance, which varied, no doubt, originally, more or less in different places, were still further disturbed by the introduction of Christianity. Unable to extirpate these rites, the church sought to Christianize them by associating them with rites of her own, and for this purpose either appointed a church-festival at the time of the heathen one, or endeavored to shift the time of the heathen observance to that of an already fixed church-festival. All over the s. of Germany, the great bonfire celebration was held at midsummer (*Johannisfeuer*), [see JOHN'S, EVE OF ST.]—a relic, probably, of the sun-festival of the summer solstice: throughout the n. of Germany, it was held at Easter. It is probable that this fire-festival (*Osterfeuer*) of Ostara—a principal deity among the Saxons and Angles—had been originally held on the 1st of May, and was shifted so as to coincide with the church-festival now known as Easter (q.v.; see also WALPURGA, ST.). The seriousness and enthusiasm with which these observances continued to be celebrated in the 16th and 17th c., began afterwards to decline, and the kindling of bonfires has been mostly put down by the governments; the earlier interdicts alleging the unchristian nature of the rites; the later, the danger occasioned to the forests.

In Great Britain, St. John's eve was celebrated with bonfires; and Easter had its fire-rites, which, although incorporated in the service of the Roman Catholic church, were clearly of heathen origin. But the great day for bonfires in the British islands was the 1st of Nov. Fewer traces of this are found in other countries, and therefore we must look upon it as more peculiarly Celtic. While the May festival of B. was in honor of the sun-god in his character of god of war—who had just put to flight the forces of cold and darkness—the Nov. festival was to celebrate his beneficent influence in producing the fruits which had just been gathered in. Hence it was called *Samhtheine* (peace-fire). If we may judge from the traces that still remain or have been recorded, the Nov. observances were more of a private nature, every house having its bonfire and its offerings, probably of fruits, concluding with a domestic feast. The B. festival, again, was public, and attended by bloody sacrifices. Although the Nov. bonfires, like B., were probably of Celtic origin, they seem to have been adopted by the inhabitants of the British islands generally. About the end of last century they were still kindled in various parts of England, and to this day, over whole districts of Aberdeenshire, every rural dwelling has its hallow-e'en bonfire lighted at nightfall in an adjoining stubble-field.

The Anglo-Saxon population of England had their own characteristic May-day rites; but there exist traces also of the observance among them on that day of rites similar to the Celtic beltane. An "Old Holne Curate," writing to *Notes and Queries* in 1853, says: "At the village of Holne, situated on one of the spurs of Dartmoor, is a field of about two acres, the property of the parish, and called the ploy (play) field. In the center of this stands a granite pillar (Menhir) 6 or 7 ft. high. On May morning, before daybreak, the young men of the village assemble there, and then proceed to the moor, where they select a ram lamb (doubtless with the consent of the owner), and after running it down, bring it in triumph to the ploy field, fasten it to the pillar, cut its throat, and then roast it whole, skin, wool, etc. At mid-day, a struggle takes place, at the risk of cut hands, for a slice, it being supposed to confer luck for the ensuing year on the fortunate devourer. As an act of gallantry, in high esteem among the females, the young men sometimes fight their way through the crowd to get a slice for their chosen among the young women, all of whom, in their best dresses, attend the *ram feast*, as it is called. Dancing, wrestling, and other games, assisted by copious libations of cider during the afternoon, prolong the festivities till midnight.

"The time, the place (looking e.), the mystic pillar, and the ram, surely bear some evidence in favor of the ram feast being a sacrifice to Baal."

Additional notices of this sun and fire worship will be found under YULE, CANDLEMAS, LAMMAS, and the other heads referred to in this article.

BELTRA'MI, a co. in s.w. Minnesota, very little settled. It has several lakes, one of which, Itasca, is 1600 ft. above sea level. Some of its lakes empty into the Red river of the n., which carries their waters to the ocean through Hudson's bay and straits, while others are emptied by the Mississippi into the gulf of Mexico.

BELTS, endless strips of flexible material, usually leather or india rubber, to transmit motion or power from one pulley to another. Ropes and chains serve a similar purpose. When chains are used, the pulleys are provided with projections which engage in the links of the chains and prevent slipping, and the mechanism has the positive relations of a rack and pinion. Ordinary flexible belts transmit power by the friction between them and their pulleys. The pulley which communicates motion is the driving pulley; that which receives, the driven pulley; that part of the belt which runs from the driven pulley to the driver is the driving part of the belt, since it is pulled by the driver, and in turn pulls on the driven pulley; the part of the belt which runs from the driver to the driven pulley is the slack belt. The strain on the driving belt is the sum of the strain of the belt on the pulleys when there is no motion, plus the strain of the friction; that on the slack belt is the same strain on the pulleys less the friction. Thus, if a belt is stretched over its pulleys with a strain of 10 lbs. per in. of width, and it requires 5 lbs. to make it slip, then the strain on the driving belt is 10 + 5=15 lbs., and the strain on the slack belt is 10—5=5 lbs., per in. of belt. As the two parts of the belt are unequally strained there will be a tendency to move, or *creep*, towards the driving belt over the driven pulley. Hence, the velocity ratio of the two pulleys will not exactly follow the inverse ratio of their radii, and the belt cannot be relied upon for giving uniformity of motion. For driving most machinery, the fact that the belt is elastic, and will slip if unduly strained, makes it a favorite method of communicating power. Rubber belts transmit about 25 per cent more power than leather, because the surface of the rubber conforms more perfectly to the minute inequalities of the pulley surface, and thus acquires a closer grasp. The texture of a rubber belt is more uniform than can be had in leather, and therefore a wide rubber belt will wear more evenly. In damp and exposed places, rubber is more durable than leather. If, however, the belt is to be shifted back and forth, as in the stopping and starting of many machines, or in cross belting—wherever the edge of the belt is liable to wear—leather is preferable. If the pulley be higher at the center than at the side, or higher at one side than at the other, the belt will creep towards the highest part; for this reason the surface of the pulley is usually made not cylindric, but of greater diameter at the center. If this be overdone, the belt does not pull, except along its central part. The pulleys usually lie in the same plane, and with their axes parallel; but this is not necessary, provided that the course of each part of the belt—the driving and the slack part alike—be in the plane of the pulley toward which that part of the belt runs; the belt being always delivered by one pulley into the plane of the other.

Transmission of power by B. is more common in the United States than in Europe. As extreme cases may be noted: a leather belt of the New Jersey zinc works, 4 thicknesses, 48 in. wide and 102 ft. long; a rubber belt in Chicago, 6 ply, 48 in. wide and 320 ft. long; a leather belt for a paper mill in Wilmington, Del., 60 in. wide and 186½ ft. long. Hempen or wire ropes, running over large pulleys with V shaped edges, are used to transmit power to long distances. The U. S. arsenal at Rock Island, Ill., carries more than half a mile by one rope the power of 4 large turbine wheels, sufficient for all the present need of the machine shops. Such cables have been called teleodynamic cables. They can be run as fast as one mile per minute, and without covering will last three years. Intermediate sheaves are required at every 300 or 400 feet. For information concerning the length of B. and the power transmitted, see RANKINE, MACHINERY AND MILL WORK, etc.

BELU'GA, a genus of *cetacea* (q.v.), of the family of *delphinidæ* or dolphins (q.v.), differing from the rest of that family in the blunt and broad head, which has no produced snout; the smaller number of teeth, the greater part of which often fall out before the animal is far advanced in age; and the want of a dorsal fin. The only species found in the northern parts of the world is *B. arctica* (for which name there are unhappily many synonyms, as *B. leucas*, etc.), the white whale and white fish of whalers, often called by English writers the B., and the round-headed cachalot. The form of the B. is remarkably characterized by the softness of all its curves, and adapts it for rapid and graceful movements; its skin is usually of a clear white color, and not very strong, so that it often fails to hold a harpoon. The B. attains a length of more than thirteen ft. The female brings forth two young ones at a birth, and displays the greatest solicitude for them. The food of the B. consists of fish, in pursuit of which it often ascends rivers to some distance. It is gregarious, and may be seen in herds of forty or fifty, which often gambol around boats; it abounds in most parts of the arctic seas, and sometimes, but not very frequently, visits the British shores. One was killed in the Firth of Forth in 1815, and one in the Medway in 1846. The Greenlanders take the B. with harpoons or with strong nets. Its flesh affords them a valuable supply of food, and is eaten by most of the inhabitants of arctic coasts; it affords also a considerable quantity of the very finest oil, and the skin is made into leather. Some of the internal membranes are also employed for various purposes.—Another species of B. is found in the southern hemisphere. It is called *B. Kingii*.

BE'LUS. See BAAL.

BELVEDERE' (It.) was originally an erection on the top of a house, for the purpose of looking out on the surrounding country, and enjoying the air, in which sense it is

still understood in Italy. A part of the Vatican (q.v.) in Rome is known as the B., and gives name to the famous statue of Apollo. In France, and with us, the word has come to signify any kind of summer-house or place of refreshment.

BELVEDERE', *Kochia scoparia, Chenopodium scoparium*, or *Salsola scoparia*, an annual plant of the natural order *Chenopodiaceæ* (q.v.), a native of the middle and s. of Europe, and of great part of Asia, which has long been very familiar in British gardens as an ornamental annual, not upon account of its flowers, which have no beauty, but of its close, pyramidal, rigid form, and numerous narrow leaves, which make it appear like a miniature cypress tree. It is sometimes called SUMMER CYPRESS.

BELVIDERE', chief t. in Boone co., Ill., 78 m. w. of Chicago, on the Chicago and Northwestern railroad; pop. '70, 3231. There are flouring mills and other manufactories.

BELVI'SIA (also called NAPOLEO'NA), a genus of exogenous plants, the type of the natural order *Belvisiaceæ*, of which order only a very few species have yet been discovered, natives of the tropical parts of Africa. They are large shrubs, with smooth, simple, leathery leaves. The flowers grow in threes, sessile in the axils of the leaves, and are beautiful and extremely curious. The calyx is a thick, leathery cup, divided into five ovate segments. The corolla consists of three distinct rings; the outer one 5-lobed, and furnished with ribs, by means of which it is strongly plaited, turning back over and hiding the calyx when full blown; the second, a narrow membrane, divided into numerous regular segments like a fringe; the third, an erect cup-shaped membrane. The stamens are erect like another cup; the ovary 5-celled, with two ovules in each cell; the style short, thick, and 5-angled, with a broad, flat, 5-angled stigma. The fruit is a soft berry, crowned with the calyx, with large kidney-shaped seeds. The wood is soft, and contains numerous dotted vessels.—The pulp of the fruit of the best known species is mucilaginous and eatable, the rind very full of tannin; the fruit is as large as a pomegranate, and the seeds 1¼ in. long.—The position of this remarkable order in the botanical system is not yet well determined. Lindley regards it as most nearly allied to *rhizophoraceæ* (Mangroves, q.v.). It is supposed by some that the two inner rings of the corolla should be regarded as sterile stamens, and the place of the order is thus fixed near *Barringtoniaceæ* (q.v.)

BELZO'NI, GIOVANNI BATTISTA, the son of a poor barber, was b. at Padua in 1778, and was educated at Rome, for the priesthood, but soon displayed a preference for mechanical science, especially hydraulics; and when the French republican troops took possession of the pontifical city, he quitted his religious studies altogether. About the year 1800, he visited Holland, and in 1803 came to England. For a time he gained a living by exhibiting feats of strength in the theaters. At Astley's, he played the part of Hercules, but he also continued his mechanical studies, and even gave numerous hydraulic representations in the most populous towns of the kingdom. After a sojourn of nine years in England, he went to Spain and Portugal, in his capacity of theatrical athlete. From the peninsula, he passed to Malta, and thence to Egypt in 1815, on the invitation of Mehemet Ali, who wished him to construct a hydraulic machine. After succeeding in this undertaking, he was induced, by the travelers Burckhardt and Salt, to direct his attention to the exploration of Egyptian antiquities. He threw himself with ardor into his new vocation. He removed the colossal bust of the so-called "Young Memnon" from the neighborhood of Thebes to Alexandria, and was the first who opened the temple of Ipsambul. In the valley of "the royal graves"—Biban-el-Moluk—near Thebes, he discovered several important catacombs containing mummies, and among others, opened, in 1817, the celebrated tomb of Psammetichus, from which he removed the splendid sarcophagus, now, along with the "Young Memnon," and other results of B.'s labors, in the British museum. But B.'s greatest undertaking was his opening of the pyramid of Cephren. An attempt made on his life caused his departure from Egypt, but previously he made a journey along the coast of the Red sea, and another to the oasis of Siwah, hoping there to find ruins of the temple of Jupiter-Ammon. In the course of his explorations, he discovered the emerald mines of Zubara and the ruins of Berenice, the ancient commercial entrepôt between Europe and India. In Sept., 1819, he returned to Europe, visited his native town, Padua, and enriched it with two Egyptian statues of granite. He also published in London his *Narrative of the Operations and Recent Discoveries within the Pyramids, Temples, Tombs, and Excavations in Egypt and Nubia; and of a Journey to the Coast of the Red Sea in search of the ancient Berenice, and another to the Oasis of Jupiter-Ammon* (1821, with an atlas of 44 colored engravings). In 1821 he opened in London an exhibition of his Egyptian antiquities, but soon afterwards undertook a journey to Timbuctoo, in central Africa. At Benin, he was attacked by dysentery, which compelled him to return to Gato, where he died, Dec. 3, 1823. His original drawings of the royal tombs he had opened in Egypt were published by his widow (London, 1829).

BEM, JOSEPH, commander of the army in Transylvania during the Hungarian revolution, 1848–49, was b. at Tarnov, in Galicia, 1795. After a course of military adventure in Poland, he went to France, where he resided for a considerable time, earning a livelihood by teaching mechanics and mnemonics. In 1848 after failing in an attempt to

organize an insurrection in Vienna, he joined the Hungarians, and was intrusted with the command of the army of Transylvania, amounting to 8000 to 10,000 men. He at first experienced some checks from the Austrian army, but afterwards defeated them at Hermannstadt and the bridge of Piski; and finally succeeded, in Mar., 1849, in driving both them and their allies, the Russians, back into Wallachia. Having thus made himself master of Transylvania, he proposed, by amnesties and general mild rule, to gain the adherence of the German and Slavonian population, especially in Wallachia; but his propositions were not entertained by Kossuth and the Hungarian commissariat. After expelling the troops under Puchner from the Banat, B. returned into Transylvania, where the Russians had defeated the Hungarians. Here he reorganized his forces, and did all that was possible in his circumstances to prevent the union of the Russians with the Austrians, but his efforts were unsuccessful. After failing in an attempt to excite an insurrection in Moldavia, he was defeated in a battle near Schäszburg, where he was opposed to three times the number of his own troops. At Kossuth's request, he now hastened into Hungary, where he took part in the unfortunate battle near Temesvar. Retreating into Transylvania, he here defended himself for some days against a vastly superior force, and then made his escape into Turkey, where he embraced, from political motives, the profession of Islam, was raised to the dignity of a pasha, and obtained a command in the Turkish army. In Feb., 1850, he was sent to Aleppo, where, after suppressing the sanguinary insurrection of the Arabs against the Christian population, he died of fever, Dec. 10, 1850. B. was in private life characterized by the benevolence of his disposition, and, as a military leader, was distinguished by courage, presence of mind when in extreme danger, and remarkable rapidity of movement.

BEMAN, NATHANIEL S. S., D.D., 1785–1871; b. N. Y.; graduate of Middlebury college; studied for the ministry, and was pastor of a Congregational church in Portland, Me. About 1813 he was a missionary in Georgia, where he labored to establish better education. In 1822, he became pastor of the First Presbyterian church in Troy, N. Y., where he officiated more than 40 years, during which period he was prominent in the moral and political questions of the time. He was moderator of the Presbyterian general assembly in 1831, and in 1837 he was a leader of the New School section. He resigned his pastoral charge in 1863. Some of his addresses and sermons have been published, in a volume. He also published *Four Sermons on the Atonement.*

BEMBATOO'KA, BAY OF, a safe and commodious bay on the n.w. coast of Madagascar, in lat. 16° s., and long. 46° e. Prime bullocks are sold here for less than 10*s.* each, and are bought extensively by agents of the French government, who have them driven to fort Dauphin, on Antongil bay, on the opposite side of the island, where they are killed and cured for the use of the French navy, and for colonial consumption. Rice is also sold very cheap at Bembatooka. Majunga, on the n. side of the bay, is an important town, Bembatooka being but a village.

BEMBE'CIDÆ, a family of hymenopterous insects of the division in which the females are furnished with stings. Along with *sphegidæ* (q.v.), and other nearly allied families, they receive the popular name of sand-wasps. They very much resemble bees or wasps in general appearance. They are natives of the warmer parts of the world. Some of them are remarkable for the odor of roses which thy emit. The females make burrows in sandy banks, in each of which they deposit an egg, and along with it the bodies of a few flies as food for the larva. The B. fly very rapidly, and with a loud buzzing noise. *Bembex rostrata* is common in the s. of Europe.

BEMBO, PIETRO, one of the most celebrated Italian scholars of the 16th c., was b. in Venice, May 20, 1470; having studied at Padua and Ferrara, he early devoted himself to polite literature. He edited the Italian poems of Petrarch, printed by Aldus, in 1501, and the *Terzerime* of Dante, 1502. In 1506, he proceeded to the court of Urbino, where he resided until 1512, when he went to Rome, where he was made secretary to pope Leo X. On the death of that pope, B. returned to Padua, where he became a liberal patron of literature and the arts, as well as a fertile writer himself. In 1529, he accepted the office of historiographer to the republic of Venice, and was also appointed keeper of St. Mark's library. In 1539, B., who had only taken the minor ecclesiastical orders, was unexpectedly presented with a cardinal's hat by pope Paul III., who afterwards appointed him to the dioceses of Gubbio and Bergamo. He died Jan. 18, 1547. B. united in his character all that is amiable. He was the restorer of good style in both Latin and Italian literature. His taste is said to have been so fastidious with regard to style, that he subjected each of his own writings to forty revisions previous to publication. Some of his writings are marred by the licentiousness of the time. Among his works may be mentioned the *Rerum Venetiearum Libri XII.* (Venice, 1551), of which he published an Italian edition (Venice, 1552); his *Prose*, dialogues in which are given the rules of the Tuscan dialect; *Gli Asolani*, a series of disputations on love, etc.; *Rime*, a collection of sonnets and canzonets; his letters, Italian and Latin; and the work, *De Virgilii Culice et Terentii Fabulis.* His collected works were published at Venice, in 4 vols., 1729.

BEM'BRIDGE BEDS are a division of the upper Eocene strata, resting on the St. Helen's, and capped by the Hempstead series. They are principally developed in the

Isle of Wight. Ed. Forbes, who carefully examined them there, has arranged them in four subdivisions: 1. The upper marls and laminated gray clays, which form the basement bed of the "black band," the lowest member of the Hempstead series. They are distinguished by the abundance of *mélania turretissima*. 2. Unfossiliferous mottled clays, alternating with fossiliferous marls and clays, whose characteristic organisms are *cerithium mutabile* and *Cyrena pulchra*. 3. The oyster-bed, consisting of greenish marl, and containing immense quantities of a species of oyster (*ostrea vectensis*), accompanied with *cerithia*, *mytili*, and other marine mollusca. 4. The Bembridge limestone, generally a compact, pale-yellow, or cream-colored limestone, but sometimes vesicular and concretionary, and containing occasionally siliceous or cherty bands. This is interstratified with shales and friable marls. All the beds are fossiliferous, containing numerous land and fresh-water shells. One bed is composed almost entirely of the remains of a little globular *paludina*. Shells of *Lymnea* and *Planorbis* are abundant, and are accompanied with the spirally striated nucules of two species of *Chara*, water-plants which have been well preserved because of the large quantity of lime which enters into their composition. In this division have been found the mammalian remains of the species of *palæotherium* (q.v.) and *anoplotherium* (q.v.) which characterize the gypseous deposits of Montmartre; it is consequently considered the British equivalent of these Parisian beds.

No marked line of distinction separates this series from the St. Helen's beds on which it rests. The contained organisms indicate that both had the same fluvio-marine origin. The maximum thickness of the Bembridge series is 115 feet.

BEN, ABEN, AVEN, EBN, IBN, are all forms, in the different Semitic languages, of the same word, which means "son," and is used as a prefix to names. *Ben*, a Hebrew form, is familiar to us from its use in Bible names—e.g., Benhadad, the son or worshiper of Hadad, or Adod, the chief idol of the Syrians; Benoni, son of my pain; Benjamin, son of the right hand, etc. These examples show that not only literal but metaphorical sonship is expressed by this prefix. This form of constructing a name by composition was common in the Semitic languages, on account of their lack of patronymics. The plural, *Beni*, is found in the names of many Arab tribes—as Beni Omayyah, the sons of Omayyah, the family known in history as the Ommiades; and sometimes in the names of places—as Beni-Hassan.

BEN, BEIN, or BHEIN, a Gaelic word signifying "mountain" or "mountain head." It is prefixed to the name of a great many mountains in Scotland—as Ben Nevis, Ben Macdhui, Ben Cruachan, etc. The corresponding term in various parts of Europe is *Pen*, which is found in many of the names in Cornwall and Wales, in the Pennine alps, and probably also in the word Apennines and the Cevennes of France.

BEN, OIL OF, a fluid fixed oil, obtained from the seeds of a tree found in India and Arabia, and known as the HORSERADISH TREE (*moringa pterygosperma*). The seeds are called BEN NUTS, and are roundish, with three membranous wings. The oil is used by watchmakers, because it does not readily freeze; also by perfumers, as the basis of various scents; and other oils are often adulterated with it. See HORSERADISH TREE.

BENALCA'ZAR, or BELARCA'ZAR, SEBASTIAN, d. 1550; a Spanish sailor who became conqueror and governor of the province of Popayan, in Peru, in 1538.

BENA'RES, a city on the left side of the Ganges, which here varies, according to the season, between 50 to 92 ft. in depth, and in width between 600 yards and a little more than half a mile. It is in lat. 25° 17′ n., and long. 83° 4′ e., being 421 m. to the n.w. of Calcutta, and 466 and 74 respectively to the s.e. of Delhi and Allahabad. Without reckoning Secrole, which, at the distance of 2 or 3 m. to the westward, contains the official establishments, B. covers, as it were, an amphitheater of 3 m. in front, and 1 m. in depth, the immediate margin of the river, which is comparatively steep, being chiefly occupied by flights of steps, or ghats, as they are called, where crowds of all classes spend the day in business, amusement, or devotion. This lively scene, backed by the minarets of about 300 mosques, and the pinnacles of about 1000 pagodas, presents a truly picturesque appearance to spectators on the opposite shore of the Ganges. On closer inspection, however, the city, as a whole, disappoints a visitor. The streets, or rather alleys, altogether impracticable for wheeled-carriages, barely afford a passage to individual horsemen or single beasts of burden; and these thoroughfares, besides being shut out from sun and air by buildings of several stories, are said to be shared with the numerous passengers by sacred bulls that roam about at will. The pop. in 1872 was 175,188.

In the traditions of the country, B. is believed to have been coeval with creation; and tolerably authentic history does assign to it a really high antiquity. In its actual condition, however, B. is a modern city. Both in extent and in embellishment, it owes much to the influence of Mahratta ascendency, which dates from the close of the 17th c.; and it possesses, perhaps, not a single structure that reaches back to the close of the 16th. As the central seat of Hinduism, B., on high occasions, attracts immense crowds of pilgrims—sometimes as many as 100,000; and some years ago, during an eclipse of the moon, forty persons were trampled to death in the streets. Naturally enough, the Brahmins of B. have always been remarkable for bigotry. Now, however, Brahminism

appears to be on the decline; and a result, which Mohammedan persecution vainly tried to produce, would seem to be gradually achieved, chiefly through the introduction of European literature and science. On the Sanscrit college, instituted in 1792, there was at a later date ingrafted an English department, comprising poetry, history, mathematics, and political economy. It is attended by numerous Hindus, and a few Mussulmans and native Christians. B., as Heber has observed, is very industrious and wealthy, as well as very holy. Besides having extensive manufactures of its own in cotton, wool, and silk, its commanding position on the grand line of communication—road, river, and rail alike—renders it the principal emporium of the neighboring regions. It is the great mart for the shawls of the north, the diamonds of the south, and the muslins of the east; while it circulates the varied productions of Europe and America over Bundelcund, Goruckpore, Nepal, etc. For the general history of the city, see the following article on the district of the same name. The details of the mutiny of 1857 will be found under the head of SECROLE. At the same time, B. proper added its share to the fearful interest of the emergency through the proverbially fanatical character of its inhabitants, who, during the second siege of Bhurtpore, had got 30,000 sabers sharpened in anticipation of a second repulse of the British.

BENA'RES, or BANA'RAS, the district mentioned in the preceding article. It is under the lieutenant-governorship of the n.w. provinces, being bounded on the w. and n. by Jounpur; on the e. by Ghazeepore and Shahabad; and on the s. and w. by Mirzapore. It extends in n. lat. between 25° 7′ and 25° 32′, and in e. long. between 82° 45′ and 83° 38′; and thus measuring about 30 m. by about 55, it embraces an area of 995 sq. miles. In 1872, the census gave a pop. of 794,039, or almost 800 to a sq.m.: the number of inhabited houses was 116,507. The district is traversed by the Ganges in a n.e. direction for about 45 miles. Besides other rivers, such as the Karamnasa, the Goomtee, and the Burna, and several inferior streams, lakes and tanks are numerous, but small, the largest not exceeding a mile in circuit. The annual rain-fall, though averaging less than in the lower parts of the Ganges, is still considerable, always exceeding 30 in., and amounting in 1823 to 89. Considering that the tract is barely beyond the tropics, and but little elevated above the sea, the range of the thermometer is unusually great, being between 45° in Jan. and 111° in May. The mean temperature is stated at 77°, pretty nearly the middle point between the two extremes. The soil, though here and there sterile, is in general characterized by great fertility, more particularly to the left of the Ganges. In the growth of opium, indigo, and sugar—more especially of the last—the district surpasses nearly every other portion of British India. In fact, the state of agriculture is such as may be expected from the density of the population. The rich fields, the thriving villages, and the luxuriant groves render the aspect of the country very delightful; and perhaps the best proof of the presence of industry and civilization is the fact that elephants, rhinoceroses, buffaloes, lions, and tigers, which were hunted in 1529, have entirely disappeared. After a Hindu domination, according to popular faith, of 2400 years, the district sank under the Mussulman yoke in 1193; and, in the first half of the 16th c., it was annexed by Baber to the Mogul empire. On the dismemberment of that dominion, it fell to the share of the Nawab of Oude, whose grandson, in 1775, ceded it to the East India company, about ten years after that body had acquired the sovereignty of Bengal.

BENA'TEK, a small t. of Bohemia, on the right bank of the Iser, a few miles distant from Prague. It is worthy of note as being for a long time the residence of the celebrated astronomer Tycho Brahé.

BENAVEN'TÉ, a t. of Spain, in the province of Zamora. It is situated on the western or right bank of the Esla, opposite to the mouth of the Cea, 34 m. n. from Zamora. It is overlooked by a huge, half-ruined castle, and surrounded by a decayed mud-wall, in which are 6 gates. It has spacious streets and squares, 6 churches, a number of schools, 3 hospitals, a bishop's palace, etc. The castle was formerly the seat of the family of Pimentel, counts of Benavente, to whose progenitor it was granted in 1394. The interior of the castle was desolated by Soult, on his retreat from Oporto, and fragments of sculpture still lie scattered about. It was at B. that Moore's retreat commenced, 28th Dec., 1809; and it was the scene of other interesting events of the peninsular war. B. is now a dull and poverty-stricken place, built chiefly of mud cottages. Pop. 2500. There is no bridge at Benavente. The Esla is crossed by a ferry-boat.

BENBECU'LA, one of the Hebrides or western isles of Scotland, between n. and s. Uist, 20 m. w. of Skye, and belonging to Inverness-shire. It is 8 m. long, and 8 broad, low and flat, and consists chiefly of bog, sand, and lake, resting on a substratum of gneiss rock, with a very broken coast-line. Pop. '71, 1563, consisting of fishermen and small farmers, who fertilize the soil with the sea-weed which is cast ashore on the island.

BENBOW, JOHN, a brave English admiral, was b. in Shropshire in 1650. He first distinguished himself as captain of a merchantman, in a bloody action with Sallee pirates. He attracted the notice of James II., who gave him a commission in the navy. After the revolution, he obtained the command of a large ship, and in the course of a few years was made rear-admiral. The high confidence reposed in him by king Wil-

liam is borne in memory by a very bad pun on his name, said to have been perpetrated by the taciturn monarch. Objecting to several names proposed for the command of an expedition, he said: "No; these are all fresh-water *beaus*, we need another kind of *beau*; we must send *Benbow*." The most memorable of this gallant sailor's exploits was his last, where his stubborn valor contrasted nobly with the dastardly behavior of his captains. Off St. Martha, in the West Indies, on the 19th Aug., 1702, he came up with a superior French force under admiral Du Casse. For four days he kept up a running-fight with the enemy, almost deserted by the rest of his squadron. On the morning of the 24th, his right leg was smashed by a chain-shot. His officers condoled with him. "I had rather have lost them both," said the sturdy admiral, "than have seen this dishonor brought upon the English nation. But, hark ye—if another shot should take me off, behave like men, and fight it out!" As soon as his wound was dressed, he was carried to the quarter-deck, and directed the fight while it lasted. The enemy sustained severe loss; but the infamous cowardice of the other captains, who actually refused to obey the admiral's signals, made the contest hopeless, and B. sailed away to Jamaica. He died of his wound on the 4th November. The recusant officers were tried by court-marshal, and two captains were shot. B.'s employment of explosive vessels at St. Malo seems to have been an anticipation of lord Dundonald's method at Basque roads.

BENCH, a hall or court where justice is administered. In this sense, however, it has in modern times received a more limited acceptation, signifying the dais or elevated part of a court-room or chamber where the judges sit to administer the laws. In English courts of justice, this seat is in form literally a bench or couch running along one end of the court-room, the number of judges and their places on this bench being marked by separate desks, one for each judge; but in Scotland and Ireland the arrangement is different, the judges in these countries sitting on chairs placed at a long, and, as in Scotland, a semicircular table, which is in a raised position. The term B. is also applied, by way of distinction, to the judges themselves as a class; thus, we speak of the *B. and bar.* It has likewise, popularly and conventionally, an ecclesiastical application, the bishops of the church of England being, as a body, sometimes designated by it; hence the expression, "B. of bishops." See BANC.

BENCH, COMMON, COURT OF. This is a technical name sometimes given to the court of common pleas. See COURTS OF COMMON LAW.

BENCH, KING'S or QUEEN'S, the supreme court of common law in the kingdom. See COURTS OF COMMON LAW.

BENCH, UPPER, the name given to the court of king's bench in the time of Cromwell. See preceding notice, and COURTS OF COMMON LAW.

BENCH'ERS. The governing bodies of the four great law societies in England, or inns of court—Lincoln's inn, inner temple, middle temple, and Gray's inn—are so called. They are generally queen's counsel or barristers of distinction; and they annually elect a president or *treasurer*, as he is called, who takes the chair at their corporate meetings, and speaks and acts in their name. See INNS OF COURT.

BENCH-WARRANT is a warrant signed by a superior judge or two justices of the peace, during the assizes or sessions, to apprehend a defendant, against whom a bill of indictment has been found. See WARRANT.

BENCOO'LEN, capital of a Dutch residency on the w. coast of Sumatra, lies in 102° 20′ e. long., and 3° 48′ s. latitude. Pop. 7000. The residency B. has an area of 9567 sq. miles. Rice, coffee, maize, sugar-cane, the cocoa-nut, and other fruits are grown. About 400,000 lbs. of pepper are produced annually. B. was founded by the English (1686), but was given to the Dutch by the London treaty, 11th Mar., 1824. Pop. of district (1871) 128,503.

BEND, one of the honorable ordinaries, or more important figures in heraldry. It is formed by two parallel lines, which may be either straight or indented, engrailled, etc. (q.v.), drawn from the dexter to the sinister base, and consequently passing athwart the shield. The B. occupies a fifth part of the shield in breadth, if plain; and a third part, if charged. The B. is supposed to represent a shoulder-belt, or scarf worn over the shoulder. When heralds speak of the B. simply, the B. dexter is understood, the B. sinister being always expressly mentioned.

Bend Sinister is the bend dexter reversed, and passing from the left to the right side of the shield, as the dexter does from the right to the left. See BAR and BASTARD BAR.

There are four diminutives of the bend—viz., the *bendlet*, the *garter*, the *cost*, and the *ribbon*.

The terms *in bend*, *per bend*, *bendy*, etc., are of frequent occurrence in heraldic works, and signify that the charge is laced, or the shield divided, diagonally in the direction of the bend.

BEND is the name for one among many kinds of knot by which ropes are fastened on shipboard. Seamen imply this meaning when they speak of "bending the cable," "bending a sail," the "carrick B.," the "fishermen's B.," the "sheet B.," etc.

BENDEMANN, EDUARD, one of the most distinguished painters of the Düsseldorf school, was b. in Berlin in 1811. Although he had received a very careful scientific education, he devoted himself to art, became a pupil of Schadow's and soon proved that he had not mistaken his vocation. As early as 1832, his great picture of the "Captive Jews" was exhibited at Berlin, and at once acknowledged to be a master-piece. His next important work, in 1833, represented "Two Girls at a Fountain." It was followed, in 1837, by "Jeremiah at the Ruins of Jerusalem," a very large picture, which excited universal enthusiasm in Paris, where it was exhibited, and for which he obtained a prize-medal. In 1838, B. was summoned to Dresden as member of the academical council, and professor of the academy of art; and the execution of the larger frescoes in the palace was intrusted to his skill. An affection of the eyes, from which he suffered for several years, interrupted the work, which is now, however, completed, and embraces a wide range of historical and mythological subjects. B.'s artistic bias is characteristic of the Düsseldorf school, his pictures being rather lyrical than dramatic. But he is distinguished by a peculiar grace and charm of his own, arising from a most perfect symmetry in drawing and composition, an exquisite *naïveté* in conception, and a tender, harmonious, yet truthful coloring. His portrait of his wife, a daughter of Schadow, is one of his best works. From 1859 till 1867, he was director of the Düsseldorf academy.

BENDER, a fortified t., with a citadel, in the province of Bessarabia, Russia. The town is situated on the right bank of the Dniester, 48 m. from its mouth, and has paper-mills, tanneries, forges, and saltpeter-works. Pop. '67, 24,443, including many Armenians, Tartars, Moldavians, and Jews. In 1770, the Russians captured the place, and put the garrison and inhabitants, then amounting to about 30,000, to the sword. It was restored to the Turks in 1774, and again stormed by the Russians in 1809. The peace of Jassy gave it back to the Turks, from whom it was again taken by the Russians in 1811, who were confirmed in the possession of it by the treaty of Bucharest in the following year.—Charles XII. of Sweden lived for some time, 1709–12, at Varnitza, a village near Bender.

BEN'DIGO, one of the most productive gold-fields in the colony of Victoria, having, in 1857, yielded, according to the official returns, 525,018 ounces. It is about 25 m. to the n. of Mount Alexander, which, again, is about 75 m. inland from Melbourne.

BENDISH, BRIDGET, 1650–1727; grand-daughter of Oliver Cromwell, endowed with much of his mental and physical energy. She had great reverence for the protector, and once challenged to a duel with swords a fellow passenger in a stage coach who had spoken disparagingly of him. Her father was gen. Ireton.

BE'NE, a t. of about 6000 inhabitants, in the province of Mondovi, Piedmont, 18 m. n.e. of Coni. It occupies the site of the ancient *Augusta Bagiennorum*, destroyed by Alaric. Many interesting vestiges are found in the neighborhood; and the ruins of an aqueduct, baths, and amphitheater are still visible.

BENEDEK, LUDWIG VON, an Austrian gen., b. in 1804 at Odenburg, in Hungary, where his father was a physician of repute. He received his military education at the Neustädt academy, and at its close entered the army as ensign in 1822. In 1843, he was promoted to the rank of senior lieut., and on the occasion of the insurrection in Galicia in 1846, had several opportunities of distinguishing himself. In Aug., 1847, as commandant of count Gyulai's infantry regiment, he moved to Italy, where a still more brilliant career awaited him. On the occasion of the retreat from Milan, and especially after Curtalone, where he had led on the assault with great skill and gallantry, his name was mentioned in the army reports by marshal Radetsky in the highest terms; and, consequently, he received the cross of the order of Maria Theresa. He afterwards distinguished himself at the taking of Mortara, and in the battle of Novara. In April, 1849, he was made maj gen. and brigadier of the first body of reserve of the army of the Danube. He commanded the *avant-garde* at Raab and Oszony, and received a slight wound in the affair at Uj-Szegedin; which did not, however, prevent him from taking a most active part in the subsequent engagements of Szörny and Ozs Ivany, where he was wounded in the foot. At the close of the Hungarian campaign, he was ordered again, high in command, to Italy. In the Italian campaign of 1859, B. commanded the 8th corps of the Austrians. At Solferino, B. drove back the Piedmontese with great slaughter, and was the last to leave the field. He was governor of Hungary in 1860, and soon afterwards got the command of the Austrian army in that country. He commanded the Austrians in the war with Prussia in 1866, but shortly after the defeat at Sadowa he was superseded.

BENEDETTI, VINCENT, Count, of Greek origin, b. Corsica, 1815. He has been French consul at Cairo and Palermo; secretary of legation in Constantinople; held office in the French department of foreign affairs, and was secretary during the negotiation of the treaty of Paris in 1856. In 1860, he went to Turin to negotiate the cession of Nice and Savoy; in 1864, he was ambassador to Berlin. B. was personally concerned in the affair of the protest of Napoleon III. against the candidacy of the prince of Hohenzollern for the throne of Spain, and forced himself upon king William in the public walk at Ems, July 13, 1870, in so offensive a manner that he was officially ignored thereafter.

Four days afterwards France declared war. B. also accused Bismarck of originating a Franco-Prussian treaty in 1866 for neutral cessions of territory, but Bismarck showed that B. himself originated the scheme.

BENEDICITÉ, a hymn or song of the three children in the fiery furnace, sung in the Christian church as early as the time of St. Chrysostom, and used in the Anglican church in the morning-services when the Te Deum is not sung.

BENEDICK, or BENEDICT, the lover in Shakespeare's *Much Ado about Nothing*, who marries "Beatrice." The name usually written "benedict" is a synonym for a man recently married, the antithesis of "bachelor."

BENEDICT is the name of fourteen popes. Of these only the following are historically important enough to deserve special mention.—BENEDICT VIII., son of count Gregory of Tuscoli, was elected in 1012; but was driven from Rome by the anti-pope Gregory. In 1014, he was restored to the papal chair by the emperor Henry II., and afterwards defeated the Saracens, and took from them, with the help of the Pisans and Genoese, the island of Sardinia; and also various places in Apulia from the Greeks, by the help of Henry. He distinguished himself as a reformer of the clergy, and interdicted, at the synod of Pavia, both clerical marriage and concubinage. He died in 1024. —BENEDICT IX., a nephew of the preceding, was elected pope at the age of 18, in 1033; but in 1038, the Romans rose in indignation, and banished him on account of his almost unexampled licentiousness. He was reinstalled by Conrad II.; again formally deposed by the consul Ptolemæus, who set up Sylvester III. in his place; and after three months, was once more installed as pope by means of bribery. By a new simoniacal compact, John Gratianus was declared pope under the name of Gregory VI. The emperor Henry III., to remove such gross scandals from the church, deposed all the three popes—B., Sylvester, and Gregory, and caused Suidger, bishop of Bamberg, to be elected as Clement II.; but on his death, in 1047, the deposed B. IX. again corruptly regained the papal see, and held it eight months, until 1049, when he was displaced, first by Damasus II., and afterwards by Leo IX. He died in the convent of Grotta Ferrata in 1056.— BENEDICT XIII., 1724–30, was a learned and well-disposed man, of simple habits and pure morals, though rather strict in his notions of the papal prerogative. He unfortunately yielded himself to the guidance of cardinal Coscia, a greedy, unscrupulous personage, who greatly abused the confidence reposed in him. B. always exhibited great moderation in politics, and an honorable love of peace, and was instrumental in bringing about the Seville treaty of 1729. During this pontificate, a remarkably large number of saints, chiefly from the monastic orders, were added to the calendar.—BENEDICT XIV. (PROSPERO LAMBERTINI), the most worthy to be remembered of all the pontiffs so named, was born at Bologna in 1675. Before his elevation, he had distinguished himself by extensive learning, and by ability in the several offices of *promotor fidei*, bishop of Ancona (1727), cardinal (1728), and archbishop of Bologna (1732). Succeeding Clement XII., he began his pontificate, in 1740, with several wise and conciliatory measures; founded chairs of physic, chemistry, and mathematics in Rome; revived the academy of Bologna, and instituted others; dug out the obelisk in the Campus Martius, constructed fountains, rebuilt churches; caused the best English and French books to be translated into Italian; and in many other ways encouraged literature and science. His piety was sincere, enlightened, and tolerant, and his doctrines were well exemplified in his practice. He was extremely anxious that the morals of the clergy should be untainted; and, to that effect, established a board of examiners for all candidates to vacant sees. In proof of his toleration, he showed the frankest kindness to all strangers visiting his capital, whatever the nature of their religious opinions. The only accusation brought against him by his Roman subjects was, "that he wrote and studied too much, but ruled too little," or left affairs of business too much in the hands of the cardinal Valentine. After a painful illness, B. XIV. died May 3, 1758.—His most important works are that *On the Diocesan Synod; On the Sacrifice of the Mass;* and *On the Beatification and Canonization of Saints.* A complete edition of his writings was published under the care of the Jesuit de Azevedo (12 vols., 1747–51), and in 16 vols. (1777).

BENEDICT, SAINT, the founder of monachism in the west, was born of a rich and respected family at Nursia, in Umbria, Italy, 480 A.D. At an early age B. was sent to the schools of literature and jurisprudence at Rome, but soon grew dissatisfied with the sterile character of the instruction dispensed. The world was full of distractions, impurities, and ignorance; and it was difficult to resist, by the ordinary safeguards of virtue, the colossal evils by which men were environed: only, therefore, in the devotions of religion, in the holy silence of solitary meditation, did B. see a safe refuge from the sins of the time, and the possibility of realizing a spiritual strength which would enable him to stem the tide of corruption that was setting in. He resolved to leave the city, and betake himself to some deep solitude in which the murmur of the world would be inaudible, and alone in the rocky wilderness wrestle with his own nature, until he had conquered it and laid it a sacrifice on the altar of God. In pursuance of this resolution, when he had only reached, according to some, the age of 14, he departed from Rome, accompanied for the first 24 m. by the nurse whom his parents had sent with him as an attendant to the city. B. then left her, and retired to a deserted country lying on a lake, hence called *Sublacum* (now Subiaco). Here, in a cavern (which afterwards

received the name of the Holy Grotto), he dwelt for three years, until his fame spread over the country, and multitudes came to see him. He was now appointed abbot of a neighboring monastery; but soon left it, as the morals of the half-wild monks were not severe enough for his taste. This, however, only excited a livelier interest in his character, and as he lived in a period when the migration and interfusion of races and nations were being rapidly carried on, he could not fail to draw crowds of wanderers about him. Wealthy Romans also placed their sons under his care, anxious that they should be trained for a spiritual life. B. was thus enabled to found 12 cloisters, over each of which he placed a superior. The savage *Goths* even were attracted to him, and employed in the useful and civilizing practice of agriculture, gardening, etc. He now sought another retreat, and, along with a few followers, founded a monastery on Monte Cassino, near Naples, afterwards one of the richest and most famous in Italy. Here he extirpated the lingering relics of paganism, and had his celebrated interview with Totila, king of the Goths, to whom he spoke frankly and sharply on his errors. In 515, he is said to have composed his *Regula Monachorum*, in which he aimed, among other things, at repressing the irregular and licentious life of the wandering monks, by introducing stricter discipline and order. It eventually became the common rule of all western monachism. The monasteries which B. founded were simply religious colleges, intended to develop a high spiritual character, which might beneficially influence the world. To the abbot was given supreme power, and he was told to acquit himself in all his relations with the wisdom of God, and of his Master. The discipline recommended by St. B. is, nevertheless, milder than that of oriental monachism with regard to food, clothing, etc.; but enjoins continual residence in the monastery, and, in addition to the usual religious exercises, directs that the monks shall employ themselves in manual labors, imparting instruction to youth, copying manuscripts for the library, etc. By this last injunction, St. B., though this was not directly intended, preserved many of the literary remains of antiquity; for the injunction, which he gave only with regard to religious books, was extended afterwards to many secular productions. It is remarkable that the founder of the most learned of all the monastic orders was himself so little of a scholar, that St. Gregory the great described him as being "*scienter nesciens, et sapienter indoctus*"—learnedly ignorant, and wisely unlearned. St. B. died Mar. 21, 543.

BENEDICT, Sir JULIUS, a musician and composer, German by birth, but, since 1836, resident in England. He was born at Stuttgart in 1805, and studied first under Hummel at Weimar, and afterwards under Weber at Dresden. On Weber's recommendation, he was, in 1824, made music director of the Kärnther Thor theater, Vienna; and he afterwards filled the same post in Naples. While in Naples, he produced an opera buffa called *Gracinta et Ernesto*, and an opera seria, *I Portogesi a Goa*. In Paris, and afterwards (1835) in London, he appeared with great success as a pianist. In 1836, he took up his permanent residence in London; and was, during that year, director of the opera buffa at the Lyceum, where he produced an operetta of his own, composed in Naples, *Un Anno ed un Giorno*. Turning his attention afterwards to English opera, he composed *The Gipsy's Warning* (1838), *The Brides of Venice* (1844), and *The Crusaders* (1843), three works which, translated into German, have been well received in the composer's native country. He conducted the opera in Covent Garden theater in 1843 and 1844, and the Norwich musical festival in 1845, and has since conducted much at concerts and great musical gatherings in London and in the provinces, besides being a successful pianoforte teacher. In 1850, he conducted at mademoiselle Jenny Lind's concerts in America. In 1860, he produced a cantata, *Undine*, at the Norwich musical festival, which was very well received. His *Lily of Killarney*, first given in 1862, at Covent Garden, was his greatest operatic success. He has since produced a cantata, *Richard Cœur de Lion*; an opera di camera, *The Bride of Song;* a romantic opera, *Esmeralda;* and a cantata, *St. Cecilia*. His operas have much dramatic and melodic beauty, and in style and feeling are singularly English, to be the composition of a foreigner. His oratorio, *St. Peter*, written for the Birmingham musical festival, 1870, met with extraordinary success. His first symphony was received with great favor in 1873. In 1878, he was for the 13th time conductor of the Norwich festival. Knighthood was conferred on B. in 1871, and he holds many foreign orders.

BENEDICT BISCOP, an English ecclesiastic of the 7th c., who exercised a most important influence on Anglo-Saxon civilization and learning. He was born about the year 629, of a noble Northumbrian family (his patronymic, according to Eddius, being Baducing), and until about his 25th year, was a courtier of Oswin, king of Northumberland. About that time, he gave up his court-life, and accompanied Wilfred to Rome (654), where he spent about ten years in study, and from which he seems to have returned soon after the synod of Whitby in 664. In 665, he was in Rome a second time, being sent on a mission by Alchfrid, king of Northumbria. After a stay at Rome of a few months, he proceeded to Lerins, in Provence, where he became a monk, received the tonsure, and spent about two years, thus acquiring a knowledge of monastic discipline. He returned to Rome in 668, came to England with Theodore and Adrian, and was made abbot of the monastery of St. Peter (afterwards that of St. Augustine) in Canterbury. This he resigned two years after, and went to Rome for a third time, for the purpose of bringing home the literary treasures which he had already collected. He returned

about 673, bringing with him a large collection of valuable books, and repaired to Northumbria, where king Ecgfrid gave him land near the mouth of the Wear, on which he founded the famous monastery of Wearmouth. Workmen were brought from France to build and glaze the church and monastery, this being one of the earliest instances of the use of glass for windows in England. He also introduced from Gaul and Rome (which he visited again in 678) church utensils and vestments, relics, pictures, images, and again a vast number of books. He also brought with him John, arch-chanter of St. Peter's, who introduced the Roman choral service. On his return from this visit to Rome, king Ecgfrid presented him with more land on the other side of the Wear, at a place called Girwi, on which he built a second monastery, dependent on Wearmouth. B. made his fifth and last journey to Rome in 685, and, as on former occasions, came home loaded with books and pictures, bringing with him also, according to Bede, two silk palls "of incomparable workmanship." Shortly after his return from Rome, about 687, he was seized with palsy, under which he languished three years, dying on the 12th Jan., 690. During his long illness, he often anxiously exhorted his monks to look carefully after his books, and preserve them from loss or injury.

The benefits conferred by B. on Anglo-Saxon civilization, which was then only in its dawn, and the impulse given by his labors to Anglo-Saxon learning, were greater than can now be estimated. It is not certain that he wrote any books, and those ascribed to him are of little value; but by his personal teaching, and especially by his founding at Wearmouth such a valuable and, for the time, extensive library, he implanted in the nation a taste for literature and learning, which soon was fruitful in results, and continued to be so for many centuries. Bede, who was his pupil, has written a life of B., and the numerous works of this "venerable" author are the best proof of the extent and variety of information to which he had access in the monastery of Wearmouth.—See Wright's *Biographia Britannica Literaria*.

BENEDICTINE EDITIONS OF THE FATHERS, scarce and costly volumes containing the works of Barnabas, Lanfranc, Bernard, Anselm, Augustine, Cassiodorus, Ambrose, Hilary, Jerome, Athanasius, Gregory of Tours, Gregory the great, Hildebert, Irenæus, Lucius Cæcilius, Chrysostom, Cyril of Jerusalem, Basil, Cyprian, Justin Martyr, Origen, and Gregory Nazianzen; in all 61 volumes.

BENEDICTINES, the general name of all the monks following the rule of St. Benedict. The first Benedictine monastery was that founded at Monte Cassino, in the kingdom of Naples, about 529, by St. Benedict himself. The order increased so rapidly, after the 6th c., that the B. must be regarded as the main agents in the spread of Christianity, civilization, and learning in the west. They are said at one time to have had as many as 37,000 monasteries, and counted among their branches the great order of Clugny, founded about 910; the still greater order of the Cistercians, founded in the following century; the congregations of Monte Cassino in 1408, of St. Vanne in 1600, and of St. Maur on the Loire, in 1627. To this last congregation all the Benedictine houses in France were affiliated. It had afterwards its chief seat at St. Maur, near Vincennes, and more lately at St. Germain-des-Prés, near Paris. Its fine conventual buildings at St. Maur on the Loire were destroyed during the revolutionary troubles. Numbering among its monks such scholars as Mabillon, Montfaucon, Sainte-Marthe, D'Achery, Martene, Durand, Rivet, Clemencet, Carpentier, Toustain, Constant, and Tassin, it has rendered services to literature which it would be difficult to overestimate. Besides admirable editions of many of the fathers, the world of letters owes to the B. of St. Maur the *Arte de Vérifier les Dates* (1783–87, in 3 vols. fol.); a much enlarged edition of Ducange's *Glossarium Mediæ et Infimæ Latinitatis* (1733–36, in 6 vols. fol.), with a supplement (1766, in 4 vols. fol.); the *De Re Diplomatica* (1681 and 1709, fol.); the *Nouveau Traité Diplomatique* (1750–65, in 6 vols. 4to); *L'Antiquité Expliquée* (1719–24, in 15 vols., fol.); the *Monuments de la Monarchie Française* 1729–33, in 5 vols. fol.); the *Acta Sanctorum S. Benedicti* (1688–1702, in 9 vols. fol.); the *Annales Ordinis S. Benedicti* (1713–39, in 6 vols. fol.); a new and much improved edition of the *Gallia Christiana* (1715–1856, in 14 vols. fol.); the *Veterum Scriptorum Spicilegium* (1653–77, in 13 vols. 4to); the *De Antiquis Monachorum Ritibus* (1690, in 2 vols. 4to); the *De Antiquis Ecclesiæ Ritibus* 1700–2,) in 3 vols. 4to); the *Thesaurus Novus Anecdotorum* (1717, in 5 vols. fol.); the *Veterum Scriptorum et Monumentorum Amplissima Collectio* (1724–33, in 9 vols. fol.); the *Histoire Litteraire de la France* (1733–49, in 9 vols. 4to). The B. were suppressed in France, along with the other monastic orders, at the revolution in 1792; and their splendid conventual buildings at St. Maur on the Loire were destroyed. They have lately been revived; and the B. of Solesmes, established in 1837, have resumed, under the direction of dom Gueranger, dom (now cardinal) Pitra, and others, some of the works which the B. of St. Maur left unfinished, and entered on literary enterprises of their own, such as the *Spicilegium Solesmense*, in 10 vols. 4to, of which four have already appeared. The chief B. houses in Germany were those of Prum, Ratisbon, Fulda, Elwang, and Saltzburg; in Spain, they had Valladolid, Burgos, and Montserrat; in Italy, Monte Cassino, Rome, Padua, and Capua. In England, most of the richest abbeys and all the cathedral priories (excepting Carlisle) belonged to this order. In Scotland the B. had the monasteries of Dunfermline, Coldingham, Kelso, Arbroath, Paisley, Melrose, Newbottle, Dundrennan, and others. In Germany, several Benedictine monks distinguished themselves as promoters of edu-

cation in the 10th c.; while in the latter half of the 11th c., the B. Lanfranc and Anselm, archbishops of Canterbury, laid the foundation of mediæval scholasticism. In Italy, also, the B. gained distinction as literati, jurists, and physicians; but almost everywhere corruption of manners appears to have accompanied increasing wealth, until gradually it became the practice to receive, almost exclusively, the sons of noble and wealthy persons as novices among the "black monks." Several of the popes attempted a reformation of the order, and at the general council of Constance, 1416, a plan of reform was laid down, but failed in being carried into practice. In the 15th c., the B. had 15,107 monasteries, of which only 5000 were left after the reformation, and now not more than about 800 can be counted. As early as 1354, this order could boast of having numbered among its followers 24 popes, 200 cardinals, 7000 archbishops, 15,000 bishops, 1560 canonized saints, and 5000 holy persons judged worthy of canonization, and 37,000 monasteries, besides 20 emperors, 10 empresses, 47 kings, above 50 queens, 20 sons of emperors, 48 sons of kings, 100 princesses, and an immense number of the nobility. Tanner (*Notit. Monast.*) enumerates 113 abbeys and other institutions of B. in England, and 73 houses of Benedictine nuns. From their dress—a long black gown, with a cowl or hood of the same, and a scapulary—the B. were commonly styled "black monks." The institution of convents for nuns of this order cannot be traced back beyond the 7th century.

The rule of St. Benedict was less severe than that which the eastern ascetics followed. Besides implicit obedience to their superior, the B. were to shun laughter, to hold no private property, to live sparely, to exercise hospitality, and, above all, to be industrious. Compared with the ascetic orders, the B., both in dress and manners, may be styled the gentlemanly order of monks: and whatever may be said of their religion, they deserve a high tribute of respect for their artistic diligence and literary undertakings. Speaking of the great productions of the B. above noticed, Sir Walter Scott characterizes them as "works of general and permanent advantage to the world at large; showing that the revenues of the B. were not always spent in self-indulgence, and that the members of that order did not uniformly slumber in sloth and indolence." Among the chief works on the history of the B. are the *Annales Ordinis S. Benedicti*, and the *Acta Sanctorum S. Benedicti*, already referred to; Reyner's *Apostolatus Benedictinorum in Anglia* (Douai, 1626, fol.); the *Bullarium Cassinense* (Venice, 1650, 2 vols. fol.); Tassin's *Histoire de la Congrégation de Saint Maur* (Paris, 1770); *Chronica de la Order de San Benito* (Salamanca, 1609-15, 7 vols. fol.); *Regula S. Benedicti et Constitutiones Congregationis S. Mauri* (Paris, 1770, 8vo); Montalembert's *Moines de l'Occident.*

BENEDICTINES (*ante*), an order of Roman Catholic nuns said to have been founded by St. Scholastica, a sister of St. Benedict. In Germany, where they had part in the conversion of the people, they look upon St. Walpurga as their founder. There are establishments in several of the United States, the earliest, in 1853, being that of St. Mary's in Pennsylvania.

BENEDICTION (from the Lat. *benedicere*, to speak well), signifies a solemn invocation of the Divine blessing upon men or things. The ceremony in its simplest form may be considered almost coeval with the earliest expressions of religious feeling. We know from Holy Writ that the Jewish patriarchs before they died invoked the blessing of God upon their children, and at a later period the priests were commanded to implore the Divine blessing upon the people. Christ sanctioned the custom, which was consequently carried forward into the primitive church, where it gradually developed itself in different forms. In the eastern as well as the western church, it is considered an essential preliminary to almost all important acts. One of the most superb spectacles that a stranger at Rome can witness, occurs on Easter Sunday, when the pope, attended by his cardinals, pronounces after mass a solemn B. *urbi et orbi* (on the city and the world). The B., however, is not confined to a form of prayer, but is accompanied with sprinkling of holy water, use of incense, making the sign of the cross, etc. The chief cases in which a B. is bestowed are—the coronation of kings and queens, the confirmation of all church dignitaries, and the consecration of church vessels, bells, and sacred robes; the nuptial ceremony, the absolution, and the last sacrament. The most solemn form of B. in the Roman church is that "with the most holy sacrament," which is administered by the bishop or priest with the monstrance or ostensory containing the consecrated elements. Besides these, lands, houses, cattle, etc., often receive a B. from the priest. In the English church-service, there are two benedictions; in the Scotch, only one. In the Greek church, when the B. is being pronounced, the priest disposes his fingers in such a manner as to convey symbolically to the faithful who are close enough to observe the arrangement, the doctrine of the Trinity, and the twofold nature of Christ.

BENEDICTUS, a portion of the service of the mass of the Roman church—also the so-called "canticle of Zachary" (Luke i. 68-79), used in the Roman service of matin-lauds, and thence adopted into the anglican morning service.

BENEDIX, JULIUS RODERICH, b. 1811; a German dramatic author, an actor and vocalist, and in 1841 manager of a theater in Wesel, where he produced *The Old Fogy*, a comedy. Since then he has written more than 30 plays, some of which have

been translated into English. He is the author of *Pictures from the Life of Actors*, and works on German legends, etc.

BEN'EFICE, or BENEFI'CIUM (Lat. "a good deed," also "a favor," and hence "a grant," or "a provision" generally, and now more especially, a provision made for an ecclesiastical person), was a term formerly applied to feudal estates, but is now used to denote certain kinds of church preferment, such as rectories, vicarages, and other parochial cures, as distinguished from bishoprics, deaneries, and other ecclesiastical dignities or offices. In this sense a distinction is accordingly taken by the 1 and 2 Vict. c. 106, s. 124, between *benefices* and *cathedral preferments;* by the former being meant all parochial or district churches, and endowed chapels and chapelries; by the latter, all deaneries, archdeaconries, and canonries, and generally all dignities and offices in any cathedral or collegiate church, below the rank of a bishop. See note in 3 Stephen's *Com.*, p. 27. By the 5 and 6 Vict. c. 27, s. 15, which is an act to enable incumbents to devise lands on farming leases, it is enacted that the word B. shall be construed to comprehend all such parochial preferment as we have above described, "the incumbent of which, in right thereof, shall be a *corporation sole*" (q.v.); and by an act passed in the same session, chap. 108, being an act for enabling ecclesiastical corporations to grant long leases, it is, by section 31, declared that B. shall mean every rectory, *with or without cure of souls*, vicarage, etc., the incumbent or holder of which shall be a corporation sole. But by a later act, the 13 and 14 Vict. c. 98, which is an act to extend a former act, the 1 and 2 Vict. c. 106, against pluralities, the term B. is, by section 3, explained to mean B. *with the cure of souls and no other*, anything in any other act to the contrary notwithstanding. Benefices are also *exempt* or *peculiar*, by which is meant that they are not to be under the ordinary control and administration of the bishop; but, by section 108 of the 1 and 2 Vict. c. 106, above mentioned, it is provided that such exempt or peculiar benefices shall nevertheless, and so far as relates to pluralities and residence, be subject to the archbishop or bishop within whose province or diocese they are locally situated.

There are, in general, four requisites to the enjoyment of a benefice. 1st, holy orders, or ordination at the hands of a bishop of the established church or other canonical bishop (a Roman Catholic priest may hold a benefice in the church of England on abjuring the tenets of his church, but he is not ordained again); 2d, Presentation, or the formal gift or grant of the B. by the lay or ecclesiastical patron; 3d, Institution at the hands of the bishop, by which the cure of souls is committed to the clergyman; and 4th, Induction, which is performed by a mandate from the bishop to the archdeacon to give the clergyman possession of the temporalities. Where the bishop is himself also patron, the presentation and institution are one and the same act, and called the *collation* to the benefice. In Scotland, the law on this subject is regulated by the 6 and 7 Vict. c. 61, passed in 1843, and commonly called lord Aberdeen's act. See ESTATE, LIVING, PARISH, PLURALISM.

BENEFICIARY is a legal term sometimes applied to the holder of a benefice. It may also denote a person who is in the enjoyment of any interest or estate held in trust by others, in which latter sense it is strictly and technically used in the law of Scotland, all having right or interest in trust-funds and estate being in that system called beneficiaries. The technical term in the law of England corresponding to this latter meaning of the word is *cestui que trust* (q.v.). Patent rights and copyrights are denominated B. privileges. See TRUST.

BENEFIT SOCIETIES, associations for mutual benefit chiefly among the laboring classes, and of which there are now great numbers; being better known under the name of FRIENDLY SOCIETIES, we refer for an account of them to that head. Meanwhile, we confine attention to that peculiar species of associations called BENEFIT BUILDING SOCIETIES, which are much better described as building societies only. These are societies established for the purpose of raising, by periodical subscriptions, a fund to assist members in obtaining heritable property, freehold or otherwise. They were formerly regulated by an act passed in 1836, the 6 and 7 William IV., and continued under its provisions till Nov., 1874, when a new act, which received the royal assent in July of that year, came into operation. All societies established thereafter *must* be governed by this later act, and those which were in existence at the time of its enactment *may* adopt it, but it is not compulsory upon them to do so. The act of 1836 declares that it shall be lawful to establish such societies, for the purpose of enabling the members to erect and purchase dwelling-houses, or acquire other real or leasehold estate, but which shall be mortgaged to the society until the amount or value of the shares drawn on shall be fully repaid with interest and all other appropriate payments. A share is not to exceed in value £150, and the corresponding monthly subscription is not to be more than twenty shillings. A majority of the members may make rules and regulations for the government and guidance of the society, such rules not being repugnant to the provisions of the act, nor to the general laws of the realm; and for offenses against these rules and regulations, fines, penalties, and forfeitures may be inflicted. No member shall be allowed to receive any interest or dividend on his share until the same has been realized, except on the withdrawal of such member according to the rules of the society.

The new act considerably enlarges the scope and powers of B. S. Section 13

declares that any number of persons may establish a society, either terminating or permanent, for the purpose of raising, by the subscriptions of the members, a stock or fund for making advances to members out of the funds of the society, upon security of freehold, copyhold, or leasehold estate, by way of mortgage; and any society under the act shall, so far as is necessary for the said purpose, have power to hold land, with the right of foreclosure, and may from time to time raise funds by the issue of shares of one or more denominations, either paid up in full or to be paid by periodical or other subscriptions, and with or without accumulating interest, and may repay such funds when no longer required for the purposes of the society. It will be seen that the restrictions of £150 and twenty shillings have disappeared, the contributions and ultimate value of a member's interest being at his own discretion. The liability of members, in respect of shares upon which an advance has been made, is limited to the amount actually paid or in arrear thereon; and in respect of shares upon which advances have been made, is limited to the amount payable under any mortgage or other security, or under the rules. Societies are empowered to receive deposits or loans, from members or other persons, corporate bodies, joint-stock companies, or terminating building societies, provided, in the case of permanent societies, that the total amount owing at one time shall not exceed two-thirds of the amount for the time being secured to a society by mortages from its members; and in the case of terminating societies, shall not exceed two-thirds as aforesaid, or a sum not exceeding twelve months' subscriptions on the shares for the time being in force. Societies established under or adopting the act of 1874 are bodies corporate, having perpetual succession and a common seal, thus dispensing with the cumbrous and inconvenient system of trusteeship. Their rules must specify the society's name and place of meeting; mode of raising funds, with their purposes and mode of investment; terms of withdrawal and repayment; manner of alteration of rules; the appointment, remuneration, and removal of officers; provisions as to general and special meetings, and the settlement of disputes, custody of seal, mortgage deeds, and securities, powers of directors and other officers, fines, and mode of dissolution. Societies may unite with others, or one society may transfer its engagements to another. They may purchase, build, hire, or take on lease any building for conducting their business. Minors may be members, but cannot vote or hold office during nonage. Accounts are to be furnished to members and loan depositors annually. The societies are exempt from stamp duties of every kind, except those upon mortgages; while those which continue under the act of 1836 retain their present exemption from stamp-duty upon mortgages also up to £500. It is not probable that this difference will be permitted to continue long; and even now the slight gain is more than counterbalanced by the privileges of incorporation, etc., conceded by the act of 1874. Receipts indorsed upon mortgages are sufficient discharges without reconveyance.

Two great divisions of building societies exist, the terminating and the permanent, but the latter are rapidly superseding the former. In the best-conducted societies, subscriptions are received at any time and to any amount, at the option of the member. The majority of members pay from ten to twenty shillings per month, and others pay smaller or much larger sums as convenient. Very large sums are received in some societies. Two societies in Bradford, Yorkshire, alone receive £900,000 per annum, and have 20,000 contributing members. Other large towns in the provinces are not far behind, and in London the societies are numerous, and in the main prosperous. The royal commissioners on friendly societies, reporting on this branch of their subject in 1872, say that they are below the mark in assuming that building societies form a group of bodies with a subscribed capital of over £9,000,000, a loan or deposit capital of over £6,000,000, over £17,000,000 total assets, having over £16,000,000 advanced on mortgage, and an income of over £11,000,000.

The theory of these institutions is very simple. Money is collected in comparatively small sums from large numbers of people, and lent to others who borrow upon real security, either to build or trade, or for any other purpose. There was a time when members were only permitted to subscribe fixed sums at stated times, and every departure from rule was visited by heavy fines. Now, in the best-conducted societies at least, every facility is given for varying powers of investment to find a place for capital, little or much; and entrance and withdrawal are equally easy. In most cases, the repayments are upon a scale calculated to pay off both principal and interest in a certain number of years, usually about fourteen, but advances on private mortgage or repayable at the borrower's convenience are becoming more frequent every year. In fact, the almost limitless adaptability of the building society system has only been appreciated of late years, and every decade sees changes and improvements in it. Under the new legislation the societies may look forward to a still more prosperous future.

BENEFIT OF CLERGY. This expression relates to happily a former state of the law of England, which at once shows the power of the clergy and the ignorance of the people. It was otherwise called *privilegium clericale*, and in the days of its real meaning and force, the benefit or privilege meant little short of the total exemption of the clerical order, in respect of crimes and offenses, from the jurisdiction and authority of the secular magistrate—an exemption pretended to be founded upon the text of Scripture, "Touch not mine anointed, and do my prophets no harm." The only exception to this

was the priest being held in custody by the king himself; but even in that case, he could only remain in such regal custody with the pleasure and consent of the bishop, who had entire control over his person, and over the inquiry into his offense. If a priest or "clerk" happened to be imprisoned by the secular arm, on a criminal charge or capital felony, he was, on the bishop's demand, to be instantly delivered up without any further inquisition; not, indeed, to be let loose upon the country, but to be detained by the ordinary, till he had either purged himself from the offense, or, having failed to do so, had been degraded; and this state of things continued till the reign of Henry VI., when it was settled that the prisoner should first be arraigned, and might either then claim his B. of C. by plea declining the jurisdiction, or, as was most usually practiced, after conviction, by way of arresting judgment. The test of admission to this singular privilege was the clerical dress and tonsure; and a story is told of one William de Bussy, a sergeant-at-law, 1259 A.D. (the practicing lawyers then were all priests), who, being called to account for his great knavery and malpractices, claimed the benefit of his orders or clergy, which till then remained an entire secret, and to this end wished to untie his coif, that he might show that he had the clerical tonsure; but this was not permitted, and the bystanders seizing him, not by the coif, but by the throat, dragged him to prison. See 1 Stephen, p. 17. But in course of time a much wider and more comprehensive criterion was established, all who could *read*, whether of the clergy or laity—a mark of great learning in those days—and therefore capable of becoming clerks, being allowed the privilege. But laymen could only claim it *once*, and upon so doing, were burned on the hand, and discharged; to be again tried, however, by the bishop, whose investigation usually resulted in an acquittal, which, although the offender had been previously convicted by his country, or perhaps by his own confession, had the effect of restoring him to his liberty, his credit, and his property—in fact, the episcopal acquittal so entirely whitewashed him, that in the eye of the law he became a new and innocent person. The mode in which the test of reading was applied was as follows: On conviction, the felon demanded his clergy, whereupon a book (commonly a psalter) was put into his hand, which he was required to read, when the judge demanded of the bishop's commissary, who was present, *Legit ut clericus?* and upon the answer to this question depended the convict's fate: if it were simply *legit*, the prisoner was burned on the hand, and discharged; but if *non legit*, he suffered the punishment due to his offense. But by 5 Anne, c. 6, the B. of C. was extended to all persons convicted of clergyable offenses, whether they could read or not; and by the same statute and several subsequent ones, instead of burning on the hand, a discretionary power was given to the judge to inflict a pecuniary fine or imprisonment. But all further attempts to modify and improve the law on this subject proving impracticable, the B. of C. was at last totally abolished, by the 7 and 8 Geo. IV. c. 28; and now by the 4 and 5 Vict. c. 22, the same is the law with regard to the peers.

This privilege had never any existence or legal meaning in Scotland; and a learned writer on the law of that country complains of its introduction into a statute applicable to Scotland (Hutchison's *Justice of the Peace in Scotland*, vol. ii., p. 131). See on the subject of this article generally, Kerr's *Blackstone*, vol. iv., p. 452; Hale's *Pleas of the Crown*, part 2, c. 45; and Reeves's *History of the English Law*.

BENEFIT OF INVENTORY, in the Scotch law, was a legal privilege whereby an heir secured himself against unlimited liability for his ancestor, by giving up, within the *annus deliberandi* (q.v.), an inventory of his heritage or real estate, to the extent of which, and no further, was the heir liable. But the *annus deliberandi* is now abolished, and the privilege in question is of the less consequence, seeing that by the 10 and 11 Vict. c. 47, ss. 23 and 25, decrees of service infer only a limited representation of a deceased party, and the heir is only liable to the extent of the inheritance descending to him. See ANNUS DELIBERANDI, HEIR, INHERITANCE, DEBT, and MORTGAGE.

BENEKE, FRIEDRICH EDUARD, professor of philosophy in Berlin, was b. in that city in 1798, and studied theology and philosophy, first at Halle, and then at Berlin. In 1820, he commenced lecturing in the latter university, but his lectures were soon interdicted by the minister Altenstein, as his philosophical views were quite opposed to those of Hegel. After a few years his lectures were again allowed, and on Hegel's death, in 1835, he was appointed extraordinary professor of philosophy. In Mar., 1854, B. disappeared suddenly from his residence, and nothing more was heard of him until June, 1856, when his body was found in the canal at Charlottenburg in the same place in which he had sought his death. B. has more affinity with British thinkers than any other German philosopher. He holds that the only possible foundation for philosophy lies in a strict adherence to the facts of our consciousness. His system of psychology is therefore what the Germans call "empirical," and his method is the Baconian as pursued in natural science. Of his numerous writings may be mentioned *Psychologische Skizzen* (2 vols. 1825–27); *Lehrbuch der Psychologie als Naturwissenschaft* (Text-book of Psychology as a Natural Science, 2d ed. 1845); *System der Logik* (2 vols. 1842); *Erziehungs-und-Unterrichtslehre* (A Treatise on Education, 1842). The best German educationists recommend B.'s psychology as more capable of practicable application than the prevailing systems of Germany.

BENET, STEPHEN VINCENT, b. Fla., 1827; a graduate of the West Point military academy. He has translated Jomini's *Political and Military History of the Campaigns of Waterloo;* in 1862, he published *Military Law and the Practice of Courts-Martial*, which is received as a text-book at the academy. During the war he did service in several responsible positions in the ordnance department, and was brevetted lieut.col. In 1874, he became chief of ordnance, with the rank of brig.gen.

BENEVENTO (ancient *Beneventum*), a city of southern Italy, capital of the province of the same name. It occupies the site of the ancient city, out of the materials of which it is entirely built, on the declivity of a hill, near the confluence of the Calore and Sabato, about 32 m. n.e. of the city of Naples. B. is about two m. in circumference, is surrounded by walls, has a citadel, a fine old cathedral, some noteworthy churches, and a magnificent arch, erected to the honor of the emperor Trajan, by the senate, 114 A.D., which, with the single exception of that of Ancona, is the best preserved specimen of Roman architecture in Italy. It is an archiepiscopal see, and has a pop. of (1872) 20,133. B. is a place of very great antiquity. Some writers attribute its origin to Diomed, and in the cathedral is a bass-relief representing the Calydonian boar adorned for sacrifice, said to be the gift of the Greek hero himself. Others give the credit of its origin to Auson, a son of Ulysses and Circe. It was, however, in the possession of the Samnites, when history first takes notice of it, and it appears to have been captured from them by the Romans, some time during the third Samnite war. It was certainly in the hands of the Romans, 274 B.C., who changed its name from Maleventum to Beneventum, six years later, and made it a Roman colony. The Carthaginians under Hanno were twice decisively defeated in the immediate neighborhood, during the second Punic war. It rapidly rose to a place of importance under the Roman empire, and was visited at various times by several of the emperors.

Under the Lombards, who conquered it in the 6th c., B. continued to flourish, and became the capital of a duchy which included nearly the half of the late kingdom of Naples. In the 9th c. the duchy was separated into three states—B., Salerno, and Capua. In 1077, the whole was taken possession of by the Normans, excepting the town and its present delegation, which had previously (1053) been presented to the pope, by the emperor Henry III. During the 11th and 12th centuries, four councils were held at the city of Benevento. Since that time, with some slight intervals, it has remained under the direct dominion of the popes, who govern it through a resident cardinal with the title of legate. In 1806, it was made a principality by Napoleon, with Talleyrand as prince of B.; but it was restored to the pope in 1815. In 1848–49, B. was faithful to the pope. The province of B. has an area of 675 sq.m.; pop. '72, 231,878.

BENEVOLENCE, in the history of the law of England, was a species of forced loan, arbitrarily levied by the kings in violation of Magna Charta, and in consequence of which it was made an article in the Petition of Rights, 3 Car. I., that no man shall be compelled to yield any gift, loan, or B. tax, or such like charge, without common consent by act of parliament; and by the statute 1 Will. and Mary, st. 2, c. 2, it is declared, that levying money for or to the use of the crown, by pretense of prerogative, without grant of parliament, or for longer time, or in other manner than the same is or shall be so granted, is illegal. See Hallam's *Constitutional History of England*, and 1 Stephen's *Com.*, p. 167.

BEN'EZET, ANTHONY, 1713–84; b. France; an American philanthropist, and one of the earliest opponents of the slave trade. He resided in Philadelphia, and left his property to endow a school for colored children.

BENFEY, THEODOR, b. 1809; professor of Sanskrit and comparative philology in the university of Göttingen. Some of his works are the *Hymn of Samaveda*, a Sanskrit grammar, a Sanskrit-English dictionary, and the *History of the Science of Languages and Oriental Philology in Germany since the commencement of the Nineteenth Century.*

BENGAL', the name of a presidency, and a province in Hindustan, the latter being distinguished as B. *proper*. In 1765, the soubah or viceroyalty of this name was, along with Bahar and part of Orissa, ceded by the great Mogul, virtually in full sovereignty, to the English East India company. As a natural consequence of this acquisition of territory, the presidency of Calcutta, which had been separated from that of Madras in 1707, came to be styled the presidency of Bengal. Moreover, in 1773, this, the youngest of the three distinct governments of British India, was elevated above both its older rivals by an act of parliament, which declared its immediate ruler to be *ex officio* the governor-general of the whole of the company's dominions. With its commanding position on and around the delta of the Ganges and the Brahmaputra, B., as a presidency, grew almost as uninterruptedly as a tree, alike to the n.w. and to the s.e.—far beyond the basins of its own mighty rivers. Within less than 90 years, it had overleaped, without a break in its continuity, at once the Irrawaddy and the Indus. Benares in the one direction, was the first considerable increment, having been absorbed in 1775; while the last addition of importance—unless one should except Oude, which, however, had really become British in 1801—was Pegu, in the other direction, the Burmese war of 1852 filling up the gap on the coast which that of 1826 had still left between Assam and Aracan on the n., and

Tenasserim on the south. From Tenasserim to the Punjab inclusive, B., as a presidency, embraced about 29° of long., and about 21° of lat. Further, it comprised, to the s.e., the detached settlements of Penang, Malacca, and Singapore; while to the n.w. it might, for a time at least, have claimed Afghanistan. The whole of this vast tract was, either directly or indirectly, under the immediate rule of the governor-general, advised, and in some cases, controlled, by a council of 5 members, of whom one was the commander-in-chief, and at least one other was not to be a company's servant.

Some time ago, the presidency of B., having proved to be too extensive for a consolidated administration, was divided into three portions—one portion remaining under the governor-general, and two being assigned to subordinate functionaries, the lieutenant-governors respectively of "the north-western provinces," and of 'Bengal.'" The first portion, under the direct sway of the governor-general, consisted of the Punjab (q.v.), the Cis-Sutlej states, 4 in number—Oude, Nagpoor, Pegu, Tenasserim; and the 3 detached settlements already mentioned in and near the straits of Malacca. The two other portions, occupying, between them, the entire space from Pegu to the Cis-Sutlej states, met near the confluence of the Gogra and the Ganges, Patna being situated in "Bengal," and Benares in "the north-western provinces." The "presidency" of B. is no longer an administrative division; the territory over which the lieutenant-governor of B. now rules is very nearly what used to be known as lower B., and comprises B. proper, Bahar, Orissa, including the tributary Mehals, Chota Nagpore, and the native states of Hill Tipperah and Kooch Bahar. The north-west provinces are no longer included in the government of B.; the Punjab has likewise an independent lieutenant-governor; Oude is under a chief commissioner; Pegu and Tenasserim are embraced in British Burmah; and since 1874 Assam too has its own chief commissioner.

According to the census of 1872, the areas and populations of the four great provinces that constitute B. in the wider sense, and are under the lieutenant-governor of B., are as follows:

	Square miles.	Inhabitants.
Bengal proper	78,982	34,277,342
Bahar	42,417	19,736,101
Chota Nagpore	28,482	3,419,561
Orissa	8,714	3,162,490
	158,595	60,595,524
Tributary states	38,324	2,218,296
Total	196,919	62,813,820

Thus the local government of B. has a population nearly twice as numerous as that of the United Kingdom. It extends from the meridian 82° to 92° e. of Greenwich, and lies within the parallels of 19° 40′ and 28° 10′ n. lat. It consists mainly of the lower plains of the Ganges, and the whole of the great delta, and comprises a portion of the valley of the Brahmapootra, and the sea-board district of Chittagong. Chota Nagpore and Orissa are beyond the western bounds of the plains of the Ganges.

In military matters, Hindustan is regarded as composed of the three presidencies of Bengal, Madras, and Bombay. When the army of B. is spoken of, we must therefore understand by B. a much larger area than that included in the above table. In 1871, the number of European soldiers in the army of B. was 35,122; native, about 65,000. Other features of B. as a presidency will fall naturally under more general heads. B. proper alone, the ancient soubah, or the modern province, now claims more special notice.

B. proper, then, is bounded on the n. by Nepaul, Sikim, and Bhotan; on the e. by Assam; on the s. by the bay of Bengal; on the s.w. by Orissa and Gundwana; and on the w. by Bahar. Taking its widest range, it measures about 350 m. from w. to e., by an average of about 300 from s. to n., and covers an area of 89,836 sq.m., embracing about 30 administrative districts. In 1871, the pop. was 36,769,735. Thus Bengal proper is somewhat smaller in extent and denser in population than Great Britain. Next to Calcutta, the cities of note are Moorshadabad, Dacca, Burdwan, Purneah, Hoogly, Midnapore, Rajmahal, Bancorah, Berhampore, etc. In B. proper, within the district of Hoogly, there stands also the French settlement of Chandernagore, containing somewhat less than 4 sq.m., with a pop. of about 33,000. The Hoogly district, moreover, contained, at one time, two other dependencies of foreign countries, the Dutch Chinsura, and the Danish Serampore, respectively ceded to England in 1824 and 1845. B. proper, as a whole, may be regarded as almost a dead level. It is only on the s.w. frontier that it shows any hill-country, for towards the n. it is said nowhere to reach even a single spur of the Himalaya. The principal rivers are the Ganges and the Brahmaputra, the former intersecting the country diagonally from n.w. to s.e., and the latter crossing its more easterly portion in a direction to the w. of south. During their lower courses, these main channels are so interlaced together as to form perhaps the most singular net-work of waters in the world; and their first point of confluence is said to be Jaffergunge—the head also of tide-water—in lat. 23° 52′ n., and long. 89° 45′ e., at a distance of 160 m. from the sea. But the thousand-isled delta commences 120 m. furthur up the Ganges, where

the highest offset, the Bhagirathi, breaks off to the right, afterwards to join a similar offset, the Jellinghee, in forming the Hoogly of Calcutta. Besides these two grand arteries, the province is watered by many less considerable rivers, chiefly northerly tributaries of the Ganges: so that even in the dryest season there is scarcely any spot 20 m. distant from a navigable stream. During the rainy months, almost every water-course in the more level regions inundates the adjacent plains; while, down in the delta, the separate floods sometimes mingle themselves into a breadth of 100 miles. To say nothing of temporary inconvenience and loss, these visitations often inflict permanent damage such as is wholly irreparable. The soil, in most parts of the province, is so decidedly alluvial, that hardly a rock or a stone meets the ascending voyager within a distance of 400 m. from the sea—a soil offering but a feeble barrier to torrents which, besides gathering, as they rise, velocity and momentum, are liable to change their direction with each increase of depth and width. A twofold evil is the result. The Ganges and the Brahmaputra, resuming, as it were, their gifts of a former age, cut for themselves new passages, to the injury of private individuals, while their old ones become so many seething swamps, to the prejudice of the public health. To a partial extent, such calamities have been averted by embankments. In these circumstances, the intercourse is ordinarily carried on by water: the Bengalee, in fact, may be viewed as almost amphibious; and on the Lower Ganges alone, there are said to be—unless in so far as steam may have reduced the number—about 30,000 professional boatmen. Speaking generally, the communications by land are merely beaten paths. The only exception of note—and that certainly a noble one—is the Grand Trunk road, which traverses the province from Calcutta upwards on its way to Delhi, Lahore, and the Indus. Much of the country is covered by thick woods and impenetrable jungles, which abound in wild animals, such as the jackal, the leopard, the tiger, and the elephant. The last is often tamed for domestic use, the more common beasts of burden being the camel and the horse, the latter of an altogether inferior variety. Lying, as B. proper does, between the 21st parallel and the 27th, its climate and productions, so far as the latitude alone is concerned, may be expected to be tolerably uniform over the entire province. But other causes intervene to affect the result. Thus, the nearer any place is to the sea, the heavier are the rains, and the broader is the overflow; the difference of moisture, however, being, in the remoter localities, often made up by irrigation. Moreover, in an inverse proportion to the latitude, the alternate monsoons of the bay of Bengal (see next article), with their respective influences on the thermometer and barometer, are more sensibly felt in the maritime tracts. Lastly, to these special causes must be added a cause of more general character—the difference of elevation. Hence, wheat and barley, for instance, grow only on the higher grounds, while rice cannot thrive unless within the range of the inundations, yielding, too, an endless diversity of varieties, according to the infinitely fluctuating conditions under which it may be cultivated. Besides grains and vegetables in great variety and abundance, B. proper gives to commerce opium, indigo, silk, sugar, tobacco, coffee, and cotton. See CALCUTTA. Cotton manufactures, once extensively carried on, particularly in the district of Dacca, have latterly given way to British competition. The article of salt, to come up under another head in connection with revenue, claims separate notice. Most of what is consumed in B. proper is made in deserts on the coast, alternately covered and abandoned by every tide, where the singularly powerful evaporation—said to be sometimes an inch a day on the depth of the adjacent bay—impairs the health of the laborer in proportion as it facilitates his labor. Of all these commodities, indigo (q.v.) is, in one important view, the most valuable, as being more likely than any other to attract English agriculturists to India. From the earliest times the dye appears to have been cultivated on the Lower Ganges, which for ages enjoyed, in this respect, the monopoly of the European trade. But when once the cultivation of the plant was introduced into America, it gradually engrossed the market—the greater care in the preparation making up for a natural inferiority in the article itself; and it was only when British capital and skill undertook the manufacture, that B. began to resume her original supremacy in this branch of agriculture. The annual rain-fall at Calcutta varies from 50 in. to 85, diminishing gradually towards the interior. At Calcutta also, in the year 1871, the mean temperature for May was 84° 12′; for July it was 83° 12′; and for Dec., 69° 48′. The prevailing winds were, from Jan. to May of the same year, n.w. to s.; from June to Sept., southerly; from Oct. to Dec., n.w. Iron and coal are understood to abound, though by no means continuously, in a tract as large as England, running to the w. from Rajmahal—a tract, however, not wholly situated in Bengal proper. In 1757, a single battle, gained against odds of twenty to one, transferred B. from the Mogul's viceroy to the English East India company—the Mogul's own grant of 1765 ratifying the decision of Plassy. B. has 10 colleges belonging entirely to the government, and 5 private colleges receiving grants-in-aid, which were attended in 1873 by 1163 students. There are 2 unaided colleges. In 1871–72, the government and aided schools numbered 4383, with 7292 teachers, and 163,280 pupils. Besides these there were 10,907 ascertained schools not receiving aid from the state, with 169,917 pupils. There is also a vast number of petty hedge schools, of which no statistics exist.

BENGAL, BAY OF, a portion of the Indian ocean, of the figure of a triangle, or rather of a quadrangle, for the northern extremity, instead of running to a point, measures about 250 m. from Balasore to Chittagong. Its southern side, drawn from Coromandel

to Malacca, so as merely to leave on the right both Ceylon and Sumatra, may be stated at 1200 miles. The bay of B. receives many large rivers—the Ganges and the Brahmaputra on the n., the Irrawaddy on the e., and on the w. the Mahanuddy, the Godavery, the Kistna or Krishna, and the Cauvery. On the w. coast, there is hardly anything worthy of the name of harbor; while on the e. there are many good ports—such as Aracan, Cheduba, Negrais, Syriam, Martaban, Tavay river, King's island, besides several more in the islands between Pegu and Sumatra. The evaporation, as stated in the previous article, sometimes amounts, in the hottest season, to about an inch a day. The monsoons prevail over the whole of the n. part of the Indian ocean, of which the bay of B. is a part, and also over the maritime tracts of B. itself. The n.e. monsoon is clearly the ordinary trade-wind of the northern hemisphere; while that from the s.w. is shown by Maury, in his *Physical Geography of the Sea*, to be a deflection of the ordinary trade-wind of the southern hemisphere. Generally speaking, the n.e. and s.w. monsoons prevail respectively in summer and winter. Maury, however, shows that, on different parallels, there are different seasons for the alternate changes.

BENGAL' ARMY. A succinct account of the military forces in India, European and native, will be found under EAST INDIA ARMY; including a notice of the changes made consequent on the transfer of the company's powers to the crown, in 1858.

BENGALI' LANGUAGE. See HINDUSTAN.

BENGAL' LIGHT, BLUE LIGHT, or BENGAL FIRE, is a brilliant signal-light used at sea during ship-wreck, and in ordinary pyrotechny for illuminating a district of country. It is prepared from niter, sulphur, and the tersulphuret of antimony. The materials are reduced to fine powder, thoroughly dried, and intimately mixed in the following proportions by weight: niter, 6; sulphur, 2; tersulphuret of antimony, 1. The mixture constitutes the B. L., and when kindled by a red-hot coal, red-hot iron, or flame, immediately bursts into rapid and vivid combustion, evolving a brilliant, penetrating, but mellow light, which, during the darkness of night, readily overcomes the gloom for a considerable space. As the fumes evolved during the combustion of the B. L. contain an oxide of antimony, and are poisonous, the light cannot be used with safety in rooms or inclosed spaces.

BENGA'ZI, a seaport t. of Barca, n. Africa, finely situated on the e. coast of the gulf of Sidra, in lat. 32° 6′ n., and long. 20° 2′ east. It has a pop. of about 7000, who carry on a trade with Malta and Barbary in oxen, sheep, wool, and corn. The value of exports in 1874 was £279,000. It has a castle, the residence of a bey, who governs it for the pasha of Tripoli. Its harbor is rapidly filling up with sand. There are here English, French, and Italian consuls. B. is chiefly interesting to the traveler, as having been the site of the ancient city of Hesperis, near which were several singularly luxuriant dells of large extent, inclosed within steep rocks rising to the height of 60 or 70 feet. These were supposed to answer well the description of the fabled gardens of the Hesperides. It first rose to importance under Ptolemy III., who called it Berenice, after his wife. It had then a large population, chiefly of Jews. Justinian afterwards fortified it.

BENGEL, JOHANN ALBRECHT, a distinguished German theologian and commentator, whose writings have exercised considerable influence in England, was b. at Winnenden, in Würtemberg, June 24, 1687. His early life was checkered by many vicissitudes. After completing his theological curriculum in 1707, he became curate of Metzingen; a year after, he was appointed theological tutor at Tübingen. Later in life, he held several high offices; among others, that of consistorial councilor and prelate of Alpirsbach, in Würtemberg, where he died Dec. 2, 1752. He was the first Protestant author who treated the exegesis of the New Testament in a thoroughly critical and judicious style. He did good service also in the rectification of the text of the Bible, and in paving the way for classifying the sacred manuscripts into families. The short notes in his *Gnomon Novi Testamenti* (Tübingen, 1742) have been generally regarded as valuable, and translated into various languages. They were especially made use of by John Wesley, in his *Notes on the New Testament*, which forms one of the standards of Wesleyan Methodism. Indeed Wesley's work may be regarded as little more than an abridged translation from Bengel. *An Exposition of the Revelation of St. John* (Stuttgard, 1740), and a chronological work—the *Ordo Temporum a Principio per Periodos Œconomiæ Divinæ Historicus atque Propheticus* (Tübingen, 1741), gained for B., in his time, a great reputation; some regarding him as an inspired prophet, but the majority as a visionary. In these works he calculated, on the basis he supposed to be laid down in the Apocalypse, that the world would endure for the space of 77777 years; and that the "breaking loose and the binding of Satan" would take place in the summer of 1836.

BENGUE'LA, a country of western Africa, the limits of which are not very definitely fixed. It is usually represented as lying between lat. 9° and 16° s., and long. 12° and 17° east. The river Coanza separates it from Angola on the n., the mountains behind cape Negro bound it on the s., and the Atlantic ocean on the west. Its surface is generally mountainous, rising from the coast-line inland, in a series of terraces; several important rivers flow through it in a n.w. direction to the Atlantic. These rivers have numerous affluents, and water is everywhere so plentiful that it may be found by digging 2 ft. beneath the surface. Vegetation of the most luxuriant and varied description is the

consequence of this humidity. The fruit-trees both of tropical and subtropical climates, succeed extremely well. The inhabitants, however, are too ignorant or indolent to take advantage of the productiveness of the soil. Animals of all kinds common to western Africa abound in B., both on land and in water. Peacocks are said to be accounted sacred in B., and kept tame about the graves of the great chiefs. Sulphur, copper, and petroleum are found in the mountains, and also gold and silver in small quantities. The coast is unusually unhealthy, but the interior is more salubrious. B. is inhabited by a variety of petty tribes, some of which are cannibals, and barbarous beyond even the barbarism of Africa. As might be anticipated, religion exists only in the form of fetichism. The Portuguese claim B., but they exercise no real power in the interior.

BENGUE'LA, ST. PHILIP DE, the Portuguese capital of the above region, on the Atlantic, near the mouth of the river Catumbella. Lat. 12° 33′ s., long. 13° 25′ east. It is very unhealthy; so inimical to European life, indeed, that the Portuguese affirm their countrywomen could not live three months in it. It has a miserable appearance, being built of half-baked bricks, and made ruinous-like by a practice that prevails of never repairing the houses, which, whenever they exhibit symptoms of decay, are abandoned for new ones erected in the vicinity. Pop. 3500, chiefly free blacks or slaves. It was a great slave-station at one time, exporting annually 20,000 slaves. The trade has fallen off greatly of late years. The town was, some time ago, invaded by a herd of thirsty elephants in quest of water, and almost entirely destroyed.

BENHAM, HENRY W., b. Conn.; a West Point graduate, in the engineering service in the war with Mexico, and wounded at Buena Vista. In 1861, brig.gen. of volunteers; his rank since 1867 being col. of engineers. He has been employed in the coast survey and the construction of harbor defences.

BENI' a river of South America, in the state of Bolivia, formed by the junction of all the streams that rush down from the eastern Andes between 14° and 18° s. latitude. Flowing through the department of its own name, it joins the Mamore to form the Madeira, one of the largest affluents of the Amazon.

BENICAR'LO, a poor, dirty, walled town of Spain, in the province of Valencia. Pop. 6000, who manufacture "full-bodied" wines for export to Bordeaux, where they are used in cooking clarets for the English market. Bad brandy is also manufactured here; and the town being situated on the Mediterranean, a little fishing is carried on.

BENICIA, the seat of justice of Solano co., Cal., and once capital of the state, on Carquinez strait, between Suisun and San Pablo bays, 30 miles n.e. of San Francisco; pop. '70, 1656. It has a good harbor, with steam communication with San Francisco. There are tanneries, flouring mills, and cement works; a collegiate institute, a law school, and St. Augustine (Episcopal) theological seminary. The U. S. military depot is here.

BE'NI-HAS'SAN, a village of upper Egypt, on the e. bank of the Nile, in lat. 27° 53′ n., and long. 30° 55′ east. The place is remarkable for the numerous grottoes in its vicinity, which are among the most interesting in Egypt. These catacombs are excavated in the calcareous bank—apparently, at one time, washed by the Nile—now flowing further w.—in which the low hills that rise in this part of the valley terminate. The catacombs are about thirty in number, and are supposed to have been used as sepulchres by the principal inhabitants of Hermopolis, a city that stood on the opposite side of the river. Some of the grottoes consist of three apartments, the largest of which is 60 by 40 ft.; and pillars are cut out of the rock in imitation of the columns that support the roofs of buildings. These shafts are polygons of sixteen sides, fluted except on the inner side, which is left smooth for a line of hieroglyphics. They are usually about 16 ft. high, and from 3 to 5 ft. in diameter at the base. The sides of the caverns are covered with paintings representing the industrial pursuits, sports, pastimes, etc., of the ancient Egyptians. The paintings, though not so artistic as those in the Theban catacombs, are of earlier date, and throw much light on the manners and customs of the people.

BE'NI-ISGUEN', a large t. in the interior of Algeria, surrounded by a rampart, flanked with towers, and said to be nearly as populous as Algiers. It has some trade in grain.

BE'NI-IS'RAEL (Sons of Israel), a remarkable race in the w. of India, who preserve a tradition of Jewish descent, and have from time immemorial acknowledged the law of Moses, although in many respects conforming to the idolatry of the Hindus by whom they are surrounded. Dr. Wilson estimates their whole number at not much more than 5000. Their original settlement was at Navagaum, about 30 m. from Bombay, where they were protected by the native princes; they have spread through the maritime parts of the Konkan, and some of them are now to be found in Bombay itself. Their features exhibit a resemblance to those of the Arabian Jews. Until recently, they were ignorant even of the names of many of the books of the Old Testament; and it was not without hesitation that they consented to receive those of the later prophets. Dr. Wilson supposes them to be a remnant of the ten tribes, and to have settled in India long before the Jews of Cochin. See COCHIN (HINDUSTAN). They reject the name of Jews, and deem its application to them a reproach. They have no MS. of the

law in their synagogues. Their communities are governed by a *mukadam*, or head-man of their own number; and their religious assemblies are presided over by a *kazi*, who also performs circumcision and other rites.

BENIN, a state in Guinea, Africa, above the mouth of the river Niger, situated in 4° to 9° n. lat., and 4° to 8° e. long. It takes its name from the western arm of the Niger—formerly supposed to be a main river, and styled *Benin* or *Formosa*—which leaves the Niger at Kirii, and, after a course of about 115 m., forms an embouchure two m. wide. The country of B. is bounded on the n.e. and the e. by the Niger; on the s. by the bay of Benin, into which cape Formosa is projected; on the w. by Dahomey; and on the n.w. by Yariba. The coast is indented by numerous estuaries, and is generally level; but the land gradually rises towards the north, until it reaches an elevation of 2500 feet in the Kong Mountains. The soil is very fertile, producing rice, yams, palms, sugar, etc. The animals are the same as those in other states of Guinea, but the hippopotamus is more common. The population is so dense that the king—who is worshiped as a great *fetich*—could, in its most flourishing days, bring into the field an army of 100,000 men. The government, customs, and superstitions of B. are like those of Ashantee. The kingdom has long been declining, and is now much broken up into independent states. The capital, Benin, situated in lat. 6° 20′ n., long. 5° 50′ e., with about 15,000 inhabitants, has a considerable trade. Messrs. Smith and Moffat, who visited it in 1838, describe its market-place as very offensive, from the effluvia rising from a heap of human skulls; while in the outskirts of the town they were still more revolted by the sight of turkey-buzzards feeding on bodies of men recently decapitated. At Gato, a harbor lower down the river, where the traveler Belzoni died, European merchants formerly had factories. Warree is another principal place. The export trade of B. consists of palm-oil, salt, blue coral, jasper, wild-beast skins, slaves, etc. B. was discovered by the Portuguese Alfonso de Aveiro, 1486. In 1786, the French founded settlements at the mouth of the river, which were destroyed by the British in 1792.

BENIN, Bight of, that portion of the gulf of Guinea (q.v.) extending from cape Formosa on the e. to cape St. Paul's on the w., a distance of about 390 m., with a coast-line of 460 miles. Several rivers empty themselves into the B. of B., the three principal of which, Benin, Escardos, and Forcados, are accessible to shipping. The coast along the Bight was blockaded in 1851 by the British fleet engaged in the suppression of the slave-trade. Palm-oil and ivory are the principal articles of trade at the towns on the coast.

BENI-SOUEF, a t. of Central Egypt, on the right bank of the Nile, about 70 m. s.s.w. of Cairo, one of the stations where travelers making the tour of Egypt usually stay. It is the entrepot of all the produce of the fertile valley of Fayoum, and has cotton-mills and alabaster quarries. Pop. 5000.

BENITIER, or Benatura, the name of the vase or vessel in which consecrated or "holy water" is held in Roman Catholic churches. In England the B. was known by the names of the "holy-water font," the "holy-water vat," "the holy-water pot," the "holy-water stone," the "holy-water stock," and the "holy-water stoup." Benitiers were either movable or fixed. Portable ones, commonly of silver, were used in processions. Fixed benitiers were placed near the doors of churches, so that the people might dip their fingers in the water, and cross themselves with it as they entered or left the church. The learned French ecclesiologist, M. Viollet-le-Duc, is disposed to think that, before the 12th c., there were no fixed-benitiers, their place being served by vases of metal set down near the entrance of the church when the doors were opened. The fixed B. is usually placed either against a pillar, or upon a pedestal. It is of all shapes, and is of the most different materials, but oftenest of stone. The benitiers belonging to the church of St. Sulpice, in Paris, are remarkable for their beauty. They are formed of magnificent shells, and bordered with gilt copper. In Great Britain, benitiers are found of every style, from Romanesque to late Third Pointed. On the continent, they range from Romanesque to Renaissance, those of the latter style being generally of marble, richly sculptured, and supported by figures.

BENJAMIN (a Hebrew proper name, signifying "son of my right hand," or "son of good fortune"), the youngest and most beloved of the sons of Jacob. His mother, Rachel, who died soon after he was born, called him *Benoni* (son of my pain), but his father changed it to Benjamin. He was the head of one of the twelve tribes of Israel. The tribe in the desert reckoned 35,400 warriors above twenty years of age; and on the entrance into Canaan, 45,600. Its territory, which was small but fertile, lay on the w. side of the Jordan, between the tribes of Ephraim and Judah. The chief places were Jericho, Bethel, Gibeon, Gilgal, and Jerusalem, the last of which was on the confines of Judah. In the time of "the Judges," the tribe of B. became involved in war with the eleven other tribes of Israel, on account of refusing to deliver up to justice the Gibeonitish ruffians who had brutally abused the concubine of an Ephraimite. The result was dreadful. All the male descendants of B. were put to the sword (Judges xx. and xxi), excepting 600, towards whom the hearts of their brethren finally relented. Saul, the first king of Israel, was of the tribe of B., which remained loyal to his son, Ishbosheth. After the death of Solomon, B., along with Judah, formed the

kingdom of Judah; and on the return from the captivity, these two constituted the principal element of the new Jewish nation.

BENJAMIN, JUDAH PETER, b. San Domingo, 1812, and came with his parents to Savannah in 1816. He studied at Yale, and began the practice of law in New Orleans. In 1852, he was elected U. S. senator as a whig, and in 1859 re-elected as a democrat. He was among the earliest of the secessionists in the congress of 1860–61, leaving the senate in February of the latter year, and becoming attorney-general of the confederacy. When the rebellion was suppressed, he left the country and has since resided in London, where he has an extensive practice in the law.

BENJAMIN, PARK, 1809–64; b. Demerara; graduate at Trinity college, Hartford; practiced law in Boston in 1832, and was an editor of the *New England Magazine*. In 1837, he removed to New York and became one of the editors of the *American Monthly Magazine*, and two years later assisted Horace Greeley in editing *The New Yorker*. In 1843 he was one of the editors of the *New World*, retiring in 1844. He wrote many poems, essays, reviews, etc.; but no collected edition of his works has been made. In person he was large and apparently very robust; but an early sickness deprived him of the use of his legs.

BENJAMIN OF TUDELA, a Jewish rabbi, was b. in Navarre, Spain. He was the first European traveler who gave information respecting the distant east. Partly with commercial views, and partly to trace the remnants of the "lost tribes," he made a journey, in the years 1159–73, from Saragossa, through Italy and Greece, to Palestine, Persia, and the borders of China, returning by way of Egypt and Sicily. He died in 1173, the last year of his travels. His notes of foreign lands—originally written in Hebrew, and frequently republished in Latin, English, Dutch, and French—are occasionally concise and valuable; but on the whole must be accepted with qualifications. Like all the early travelers, B. had a greedy ear for the marvelous. His errors are also numerous. The latest edition by Asher (London, 1841) contains the original text, with an English translation and learned annotations.

BENJAMIN TREE. See BENZOIN.

BEN LAWERS, a mountain in Perthshire, Scotland, about 32 m. w.n.w. of Perth, on the w. side of Loch Tay. This mountain, which is easy of ascent, is rich in specimens of Alpine plants, and a magnificent view is commanded from its summit, which has an elevation of 3984 feet. Ore of titanium is found in the mountain.

BEN LE'DI, a mountain also of Perthshire, 4 m. w.n.w. of Callander, with an elevation of 2882 feet. It received its name from the Druids, who are supposed to have had a place of worship on its summit—the Gaelic words *Beinn-le-Dia*, signifying "hill of God." This mountain is celebrated in Scott's *Lady of the Lake*.

BEN-LO'MOND, a celebrated Scottish mountain in the n.w. of Stirlingshire, on the e. side of Loch Lomond, and about 27 m. w.n.w. of Stirling. This mountain, forming the s. extremity of the Grampians or Central Scottish Highlands, is 3192 ft. high, and consists of mica slate, with veins of quartz, greenstone, and feldspar porphyry. The summit is precipitous on the n. side, with a gentle declivity on the s.e.; it is covered with vegetation to the top. Though considerably surpassed in height by several other Scottish mountains, none are more imposing. Seen from Loch Lomond, it appears a truncated cone, and from between Stirling and Aberfoyle, a regular pyramid. It has perhaps been ascended by a greater number of tourists than any other of the Highland mountains. The magnificent view from the top, in clear weather, includes the whole length (30 m.) of Loch Lomond, with its diversified isles, and wooded and cultivated shores, the rich plains of Stirlingshire and the Lothians, the windings of the Forth, the castles of Stirling and Edinburgh, the heights of Lanarkshire, the vales of Renfrewshire, Ayrshire, Firth of Clyde, isles of Arran and Bute, the Irish coast, Kintyre, and the Atlantic. The n. semicircle of the horizon is bounded by ben Lawers, Voirlich, Ledi, Cruachan, and Nevis; while some of the beautiful Perthshire lochs are seen.

BEN MACDHUI, a lofty mountain of Aberdeenshire, belonging to the Grampian range, at one time regarded as the highest in Great Britain, but now ascertained to be the second—its elevation being 4296 feet.

BENNET, HENRY, earl of Arlington, 1618–85; a distinguished English statesman in the reign of Charles II. In the beginning of the civil war he was under-secretary to lord Digby, the secretary of state. He afterwards volunteered in the royal cause, and did good service, especially at Andover, where he was wounded. He was made secretary to the duke of York; in 1658, knighted by Charles, at Bruges, and sent as envoy to the court of Spain. On the king's return to England, B. was called home, and made keeper of the privy purse and principal secretary of state. In 1670, he was one of the council that got the nickname of the "cabal," and one of those who advised shutting up the exchequer. In 1672, he was made earl of Arlington and viscount Thetford, and soon afterwards a knight of the garter. His *Letters to Sir William Temple* were published after his death.

BENNETT, JAMES GORDON, b. Scotland, Sept. 1, 1795, d. N. Y., June 1, 1872. He was intended for the priesthood by his parents, who sent him to a Roman Catholic sem-

inary; but in 1819, he migrated to America, and began teaching in Halifax, N. S. In the autumn of that year, he reached Boston and took the situation of proof-reader in a publishing house, and while there made his first literary venture in fugitive poems. In 1822, he was on the *Charleston Courier* as Spanish translator and special writer. Coming to New York, he undertook to start a commercial school, but abandoned the idea and took to lecturing on political economy. In 1825, he owned the *New York Courier*, a short-lived Sunday journal. Then he became a casual reporter and writer, now technically called a "Bohemian;" in 1826, he obtained regular employment on Snowden's *National Advocate*, and was active as a politician. In 1827, he wrote for the *New York Enquirer*, edited by Mordecai B. Noah, and in 1828 was its Washington correspondent. The next year the *Enquirer* was united to the *Courier*, and in the autumn B. became associate editor of the *New York Courier and Enquirer*. In 1832, in consequence of a difference of opinion about the U. S. bank between him and James Watson Webb, the responsible editor, B. left the *Courier and Enquirer*, and in October issued the *New York Globe*, which lived four weeks. He next appeared as a share-owner in the *Pennsylvanian*, of Philadelphia, and in 1833 was chief editor. In 1834, he returned to New York, and on Wednesday morning, May 6, 1835, he issued from the basement of No. 20 Wall street, No. 1 of the *Herald*, price one cent. It had four pages of four columns each, the whole surface of print being a little less than 3½ sq.ft., of which one quarter was occupied by advertisements. The *Herald* issues now (1880) on Sundays occasionally sheets of 24 pages of 6 columns, or 144 columns, having a printed surface of 48 sq.ft., of which two thirds are taken by advertisers. The cost of advertising in the first number was 50 cents for 16 lines; at present the same number of lines costs $6.40. In the opening editorial, B. announced his independence of parties, cliques, and factions, and proposed to publish simply an independent newspaper. On the 11th of the month the second number was issued, and contained the "money," or "Wall street" article, a department now indispensable to a morning newspaper in any commercial city. For some time all the editorials, reports, etc., were written by the editor himself, who often wrote in the first person, and with a pungency that secured attention and circulation. He took immediate advantage of ocean steamers and the telegraph to secure news, and his paper reported through Morse's experimental wires the first speech ever sent by telegraph to any journal, that of John C. Calhoun on the war with Mexico. The *Herald* was the first daily paper to issue on Sundays, and the first to publish on every day in the year. Hesitating at no trouble or expense, and availing himself of the steamship, the telegraph, the horse-express, and the post-office, B. soon made the *Herald* widely known as what he meant it to be—a newspaper, to increase the importance and value of which was the sole ambition of his life. He left two children, a daughter and James Gordon, Jr., bequeathing the *Herald* entire to the son, who continues it with the spirit and enterprise of the founder.

BENNETT, JOHN HUGHES, 1812–75; b. London. He was educated at Exeter and Edinburgh, and studied in Paris and Germany. He was for 26 years professor of the institutes of medicine in Edinburgh university. He was an able teacher, and his original investigations entitle him to a high place in the history of medicine. His best known publications are *Clinical Lectures, Treatise on Physiology*, and *Text-Book of Physiology*.

BENNETT, Sir WILLIAM STERNDALE, MUS.D., D.C.L., English pianist and composer, was b. at Sheffield, April 13, 1816. After studying under Crotch, Holmes, and Potter, in the royal academy, London, he attracted the notice of Mendelssohn at the Düsseldorf musical festival, appeared with success at Leipsic in the winter of 1837–38, and was received with great applause when he returned to London. In 1838, he was elected member of the royal society of music. In 1856, he succeeded Mr. Walmsley as professor of music at Cambridge. At the opening of the international exhibition, 1862, Tennyson's ode, *Uplift a Thousand Voices*, set to music by B., was fervidly sung. In 1868, he was appointed principal of the royal academy of music; and was knighted in 1871. He died in 1875.

BEN NEVIS, the highest mountain in Great Britain, is situated in the co. of Inverness, Scotland. It has a height of 4406 ft., is exceedingly difficult of ascent, with a tremendous precipice of 1500 ft. in depth on the n.e. side. Here snow remains throughout the year. Granite and gneiss form the base of the mountain, which in its upper part is composed of porphyry.

BENNIGSEN, LEVIN AUG. THEOPHILUS, Count, one of the most famous Russian generals, was b. at Brunswick, Feb. 10, 1745. His father was an officer in the Brunswick guards; and B. himself entered the Hanoverian service for a time; but having squandered the property left him, he joined the Russian army in 1773, and in the Turkish war soon attracted the notice of the empress, Catherine, who employed him to carry out her designs against Poland. He was one of the leaders of the conspiracy against the emperor Paul (1801); though he is said not to have been present at the catastrophe, but to have prevented the empress Maria from rushing to her husband when she heard his cries. He fought with considerable success in the battle of Pultusk (1806), and held the chief command in the obstinate and murderous struggle at Eylau (1807). When Napoleon invaded Russia in 1812, B. commanded the Russian center on the bloody field of Borodino, and gave his voice for fighting a second battle before the walls of Moscow.

Before the French began their retreat, he gained a brilliant victory over Murat at Wcronowa (Oct. 18th). Differences with Kutusov, who would not adopt B.'s plan to prevent the French from crossing the Beresina, made him retire from the army; but after Kutusov's death, he took the command of the Russian army of reserve, which entered Saxony in July, 1813, fought victoriously at the battle of Leipsic, and was created count by the emperor Alexander on the field. When Leipsic was taken, it was he that was commissioned by the allies to announce to the king of Saxony that he was a prisoner. Failing health made him retire from the Russian service in 1818 to his paternal estate in Hanover, where he died Oct. 3, 1826.—His son, ALEX. LEVIN B., became a leading Hanoverian statesman.

BENNINGSEN, RUDOLF VON, b. 1824; a Hanoverian statesman who was elected in 1866 (after the annexation) to the North German diet and the Prussian assembly, becoming vice-president of both bodies and a prominent liberal leader. He has also superintended the administration of government in the province of Hanover.

BENNINGTON, a co. in s.w. Vermont, on the Massachusetts and New York lines; drained by Hoosac river, reached by the Rensselaer and Saratoga railroad; 700 sq.m.; pop. '80, 21,945. It is famous for quarries of fine marble, and is a good agricultural region. Co. seats, Bennington and Manchester.

BENNINGTON, a t. in B. co., Vt., 35 m. n.e. of Albany, N. Y., on the Harlem Extension railroad; pop. '80, 6,333. It has important manufactories of parian ware and porcelain from materials abundant in the neighborhood. There is an observatory on Mt. Anthony, near the village. The "battle of B." was fought Aug. 16, 1777, when gen. Stark, leading a force of New Hampshire militia, defeated col. Baum and a detachment of Burgoyne's army. The English lost 200 killed, 600 prisoners, and 1000 stands of arms; the Americans lost 14 killed and 42 wounded.

BEN-RHYD'DING, a celebrated hydropathic establishment in the West Riding of Yorkshire, in a beautiful situation on the right bank of the river Wharf, 16 m. n.w. of Leeds. The building, erected in 1846 at the cost of nearly £30,000, is a very imposing pile, on an eminence midway up the side of the valley. There is accommodation for a large number of patients and visitors, and extensive pleasure grounds around. In addition to the usual appliances of the water-cure, and a variety of gymnastic exercises, Dr. M'Leod (who died in 1875) introduced the compressed-air bath (q.v.); and some time ago, a sumptuous Turkish bath was added to the other attractions of the establishment.

BEN'SHIE, or BAN'SHEE, an imaginary being in the superstitions of the Irish. The B. is a female, who is called the wife of the fairies, and she makes herself known by wailings and shrieks, premonitory of a death in the family over which she is presumed to exercise a kind of guardianship. The name of this tutelary demon is supposed to be from the Irish Celtic *ben* or *bean*, a woman; and *sighe*, a fairy. A similar superstition prevailed, and is perhaps not yet extinct, in the highlands of Scotland.

BENSON, JOSEPH, 1748–1821; an English preacher; he was educated for the established church, but became a Methodist and succeeded Wesley as president of the conference of the church. He was editor of the *Wesleyan Magazine*, and author of three works in especial defense of the Methodists, *Sermons on Various Occasions*, *Life of John Fletcher*, and *Commentary on the Holy Scriptures*.

BENT, a co. in e.s.e. Colorado, on the Kansas border, bounded on the s. by the Arkansas river, and intersected by the Kansas Pacific, and the Atchison, Topeka and Santa Fe railroads; pop. '70, 592; in '80, 1674. The surface is level. Productions chiefly agricultural. Co. seat, Las Animas.

BENT GRASS, *Agrostis*, a genus of grasses, distinguished by a loose panicle of small, one-flowered, laterally compressed spikelets; the glumes unequal, awnless, and longer than the paleæ, which are also unequal, and of which the inner one is sometimes wanting, and the outer sometimes has and sometimes has not an awn; the seed free. (For explanation of these terms, see GRASSES.) The species are numerous, and are found in almost all countries and climates; several are natives of Britain. All of them are grasses of a slender and delicate appearance. Some are very useful as pasture-grasses and for hay, upon account of their adaptation to certain kinds of soil, although none of them is regarded as very nutritious.—The common B. G. (*A. vulgaris*) forms a principal part of the pasture in almost all the elevated districts of Britain, and is equally abundant in many parts of the continent of Europe. It resists drought better than almost any other grass, but is only sown by agriculturists on soils unsuitable for the more luxuriant grasses. It is also regarded as very suitable for lawns; but in light, dry, cultivated grounds, it is often a troublesome weed, known as black squitch, or quick-grass, and frequent harrowing is resorted to for the removal of its creeping perennial roots. It is as frequent on wet as on dry soils, and varies much in size and appearance.—The marsh B. G. (*A. alba*), also very common in Britain, forming a large part of the natural pasture in many moist situations, is very similar to the species just described, but generally taller and stouter. Of this also there are many varieties, but, in all of them, the *ligule* (the little membranous tongue at the junction of the blade of the leaf with its sheathing base) is elongated and acute, whilst in *A. vulgaris* it is very short, and appears as if cut

off. A variety, so little different as scarcely to deserve the name, but with somewhat broader leaves and more luxuriant habit of growth, was at one time much celebrated among agriculturists, under the name of florin grass, or *agrostis stolonifera*. It was unduly lauded, and the consequent disappointment led to its being unduly disparaged. It is a useful grass in moist grounds, newly reclaimed bogs, or land liable to inundation. The first three or four joints of the culms lie flat on the damp soil, emitting roots in abundance, and it was formerly propagated by chopping these into pieces, and scattering them, but now generally by seed.—Herd grass (*A. dispar*) is a native of the United States, with broader leaves than either of the preceding species, very creeping roots, and large panicles almost level at top. It was at one time strongly recommended for cultivation, but has gone out of repute in Britain. It is, however, more highly esteemed in France, particularly upon account of the great crop which it yields on deep sand and on moist calcareous soils.—Brown B. G. (*A. canina*), a common perennial British grass, abundant in moist heaths and moorish grounds, is valuable for mixing with other grasses to form permanent pasture on poor wet peaty soils.—Silky B. G. (*A. spici venti*) is a beautiful grass, with very slender branches to its ample panicle, which, as it waves in the wind, has a glossy and silky appearance. It is a rare native of sandy grounds in England, common in southern and central Europe; an annual grass, occasionally sown in spring to fill up blanks in grass-fields.

BENTHAM, JEREMY, an eccentric but eminent writer on ethics and jurisprudence, was the son of a wealthy solicitor in London, where he was born (in Red Lion street, Houndsditch) on the 15th Feb., 1748. He received his early education at Westminster school; and, when yet a boy, being little more than twelve years of age, he went to Queen's college, Oxford, where he took his master's degree in 1766. But though his years were so tender, he appears not to have been so unprepared as might be supposed to benefit by the university; for before entering it, he had already, by his precocious tendencies to speculation, acquired the title of "philosopher." On graduating, his father, who expected his son to become lord chancellor, set him to the study of the law at Lincoln's inn, where he was called to the bar in 1772. He never practiced in his profession, however, for which he had a strong distaste, which is paraded in many of his writings. Turning from the practice of law to its theory, he became the greatest critic of legislation and government in his day. His first publication, *A Fragment on Government*, 1776, was an acutely hypercritical examination of a passage in Blackstone's *Commentaries*, prompted, as he has himself explained, by "a passion for improvement in those shapes in which the lot of mankind is meliorated by it." The *Fragment* abounds in fine, original, and just observation; it contains the germs of most of his after-writings, and must be highly esteemed, if we look away from its disproportion to its subject and the writer's disregard of method. The *Fragment* procured him the acquaintance of lord Lansdowne, in whose society at Bowood he afterwards passed perhaps the most agreeable hours of his life. It was in the Bowood society that he conceived an attachment to Miss Caroline Fox (Lord Holland's sister), who was still a young lady, when B., in the 54th year of his age, offered her his heart and hand, and was rejected "with all respect." In 1778, he published a pamphlet on *The Hard Labor Bill*, recommending an improvement in the mode of criminal punishment; which he followed in 1811 by *A Theory of Punishments and Rewards*. In these two works, B. did more than any other writer of his time to rationalize the theory of punishments by consideration of their various kinds and effects, their true objects, and the conditions of their efficiency. He published, in 1787, *Letters on Usury;* in 1789, *Introduction to the Principles of Morals and Legislation;* in 1802, *Discourses on Civil and Penal Legislation;* in 1813, *A Treatise on Judicial Evidence;* in 1817, *Paper Relative to Codification and Public Instruction;* in 1824, *The Book of Fallacies*. These were followed by other works of less consequence. His whole productions have been collected and edited by Dr. Bowring and Mr. John Hill Burton, and published in eleven volumes. It is well, however, for B.'s reputation, that it does not rest wholly on his collected works; and that he found in M. Dumont, Mr. James Mill, and sir Samuel Romilly, generous disciples to diffuse his principles and promote his fame. In his early works, his style was clear, free, spirited, and often eloquent; but in his later works it became repulsive, through being overloaded and darkened with technical terms. It is in regard to these more especially that M. Dumont has most materially served his master by arranging and translating them into French, through the medium of which language B.'s doctrines were propagated throughout Europe, till they became more popular abroad than at home. Mr. James Mill, himself an independent thinker, did much in his writings to extend the application in new directions of B.'s principles, a work in which, apart from his original efforts, he has achieved a lasting monument of his own subtilty and vigor of mind. Criticisms of B.'s writings will be found in the *Edinburgh Review*, by sir Samuel Romilly, and in the *Ethical Dissertation* (*Encyclopædia Britannica*, 7th and 8th eds.), by sir James Mackintosh. But the most valuable contribution in English to his reputation is unquestionably *Benthamiana*, by Mr. John Hill Burton, advocate, containing a memoir, selections of all the leading and important passages from his various writings, and an appendix embracing an essay on his system, and a brief clear view of all his leading doctrines.

In all B.'s ethical and political writings, the doctrine of utility is the leading and

pervading principle; and his favorite vehicle for its expression is the phrase, "the greatest happiness of the greatest number," which was first coined by Priestley, though its prominence in politics has been owing to Bentham. "In this phrase," he says, "I saw delineated for the first time a plain as well as a true standard for whatever is right or wrong, useful, useless, or mischievous, in human conduct, whether in the field of morals or politics." In need scarcely be remarked that the phrase affords no guidance as to how the benevolent end pointed at is to be attained; and is no more than a quasi-concrete expression of the objects of true benevolence. In considering how to compass these objects, B. arrived at various conclusions, which he advocated irrespective of the conditions of society in his day, and of the laws of social growth which, indeed, neither he nor his contemporaries understood. He demanded nothing less than the immediate remodeling of the government, and the codification and reconstruction of the laws; and insisted, among other changes, on those which came at a later day to be popularly demanded as the points of the "charter"—viz., universal suffrage, annual parliaments, vote by ballot, and paid representatives. However impossible some of these schemes were, it cannot be denied that B. did more to rouse the spirit of modern reform and improvement in laws and politics, than any other writer of his day. Many of his schemes have been, and many more are, in the course of being slowly realized; the end and object of them all was the general welfare, and his chief error—apart from his overestimate of the value of some changes which he proposed—lay in conceiving that organic changes are possible through any other process than that of growth and modification of the popular wants and sentiments. It was this error that led the philosopher, in his closet in London, to devise codes of laws for Russia (through which country he made a tour in 1785) and America, the adoption of which would have been equivalent to revolutions in these countries, and then bitterly to bewail the folly of mankind when his schemes were rejected.

In ethics, as in politics, he pressed his doctrines to extremes. It has been said that his doctrine of utility was so extended that it would have been practically dangerous, but for the incapacity of the bulk of mankind for acting on a speculative theory.

By the death of his father in 1792, B. succeeded to property in London, and to farms in Essex, yielding from £500 to £600 a year. He lived frugally, but with elegance, in one of his London houses (Queen square, Westminster); and, employing young men as secretaries, corresponded and wrote daily. By a life of temperance and industry, with great self-complacency, in the society of a few devoted friends (who, says sir James Mackintosh, more resembled the hearers of an Athenian philosopher than the proselytes of a modern writer), B. attained to the age of 84. He died in June, 1832.

BENTHAMIA, a genus of plants of the natural order *cornaceæ* (q.v.), consisting of Asiatic trees or shrubs, of which the fruit is formed of many small drupes grown together. *B. frugifera*, a native of Nepaul, is a small tree, with lanceolate leaves, and a reddish fruit, not unlike a mulberry, but larger; not unpleasant to the taste. It has ripened fruit in the s. of England, and will probably be found to succeed in the open air, wherever the winters are so mild that fuchsias are not cut down by frost. The flowers are fragrant.

BENTINCK, Lord WILLIAM GEORGE FREDERICK CAVENDISH, commonly called lord George B., at one time the leader of the agricultural protection party, third son of the fourth duke of Portland, was born 27th Feb., 1802, and entering the army when young, eventually attained the rank of maj. He subsequently became private secretary to his uncle, the right hon. George Canning. Elected in 1826 M.P. for Lynn-Regis, he sat for that borough till his death. At first, attached to no party, he voted for Catholic emancipation and for the principle of the reform bill, but against several of its most important details, and in favor of the celebrated Chandos clause (q.v.). On the formation of sir Robert Peel's ministry in Dec., 1834, he and his friend lord Stanley, afterwards earl of Derby, with some adherents, formed a separate section in the house of commons. On the resignation of sir Robert Peel in April following, lord George openly joined the great conservative party, which acknowledged that statesman as its head, and adhered to it for nearly eleven years. On Peel's return to power in 1841, lord George received an offer of office, which he declined, being at that time deeply interested in the sports of the field and the race-course. When Peel introduced his free-trade measures in 1845, a large portion of his supporters joined the protection party then formed, of which lord George became the head, and a leading speaker in the debates. His speeches in the session of 1845–46 were most damaging to the government of sir Robert Peel, and contributed in no small degree to hasten its downfall in July of the latter year. Lord George supported the bill for the removal of the Jewish disabilities, and recommended the payment of the Roman Catholic clergy by the landowners of Ireland. In the sporting world he is understood to have realized very considerable gains, and he showed the utmost zeal at all times to suppress the dishonest practices of the turf. He died suddenly of a spasm of the heart, 21st Sept., 1848, while crossing his father's park at Welbeck Abbey, Nottinghamshire.

BENTINCK, Lord WILLIAM HENRY CAVENDISH, a general officer and statesman, uncle of the preceding, and second son of the third duke of Portland, was born 14th Sept.,

1774, and became an ensign in the Coldstream guards in 1791. Having served with distinction in Flanders, Italy, and Egypt, he was in 1803 appointed governor of Madras, where he advocated several useful reforms; but his proscription of beards and the wearing of turbans and earrings by the sepoys when on duty, led to the mutiny and massacre of Vellore, and his own immediate recall. In Aug., 1808, he was placed on the staff of the army in Portugal under sir Harry Burrard. Subsequently selected to proceed on an important mission to the supreme Junta of Spain, he accompanied the army under sir John Moore in its retreat, and at Corunna commanded a brigade. He next commanded a division of lord Wellington's army, and shortly after was sent as British minister to the court of Sicily, and commander-in-chief of the British forces in that island. At the head of an expedition, he landed in Catalonia in July, 1813, penetrated to Valencia, and afterwards laid siege to Tarragona, but was repulsed at Villa Franca. Early in 1814, quitting Sicily, he repaired to Tuscany, published at Florence a proclamation inviting the Italians to shake off the French yoke, and afterwards made himself master of Genoa. Between 1796 and 1826, he held a seat in parliament as member for Camelford, Nottinghamshire, and Ashburton. In 1827, he was appointed gov.gen. of India, and sworn a privy-councilor. His policy in India was pacific and popular, and his viceroyship was marked by the abolition of sutti (q.v.), and by the opening up of the internal communication, as well as the establishment of the overland route. After his return in 1835, he was elected M.P. for Glasgow. He died at Paris, June 17, 1839.

BENTIVOGLIO, GIOVANNI; 1438–1508; chief magistrate of Bologna, while it was a republic, continuing his father's rule with great severity; but "his encouragement of the fine arts and his decoration of the city by sumptuous edifices, gilded his usurpation." He was expelled by pope Julian II. in 1506, and died in Milan.

BENTLEY, RICHARD, a distinguished classical scholar, was b. at Oulton, in Yorkshire, Jan. 27, 1662. In 1676, he entered St. John's college, Cambridge, in the humble capacity of subsizar. Little is known of his university career, except that he showed early a strong taste for the cultivation of ancient learning. At the usual time, he took the degree of bachelor of arts; and on leaving the university, he was appointed headmaster of the grammar-school of Spalding, Lincolnshire. About a year afterwards, he resigned this situation to become tutor to the son of Dr. Stillingfleet, then dean of St. Paul's, and subsequently bishop of Worcester. B. accompanied his pupil to Oxford, where he had full scope for the cultivation of classical studies; and that he succeeded in acquiring there some local reputation, is evinced by his having been twice appointed to deliver the Boyle lectures on the evidences of natural and revealed religion. He entered the church, and owed to the patronage of the bishop of Worcester various good ecclesiastical appointments, and through the same influence became librarian of the king's library at St. James'. In 1690, he published his *Dissertation upon the Epistles of Phalaris*, which established his reputation throughout Europe, and may be said to have commenced a new era in scholarship. The principles of historical criticism were then unknown, and their first application to establish that the so-called epistles of Phalaris, which professed to have been written in the 6th c. B.C., were the forgery of a period some eight centuries later, filled the learned world with astonishment.

In 1700, B. was appointed master of Trinity college, Cambridge; and in the following year, he married Mrs. Joanna Bernard, the daughter of a Huntingdonshire knight. The history of B.'s mastership of Trinity is the narrative of an unbroken series of quarrels and litigations, provoked by his arrogance and rapacity, for which, it must be confessed, he was fully as well known during his lifetime as for his learning. He contrived, nevertheless, to get himself appointed regius professor of divinity, and, by his boldness and perseverance, managed to pass scathless through all his controversies. Notwithstanding that at one time the bishop of Ely, the visitor of Trinity, pronounced sentence depriving him of his mastership, and that at another the senate of the university pronounced a similar sentence of his academic honors, he remained in full possession of both the former and the latter till the day of his death. This stormy life did not impair his literary activity. He edited various classics—among others, the works of Horace—upon which he bestowed vast labor. He is, however, more celebrated for what he proposed than for what he actually performed. The proposal to print an edition of the Greek New Testament, in which the received text should be corrected by a careful comparison with all the existing MSS., was then singularly bold, and evoked violent opposition. He failed in carrying out his proposal; but the principles of criticism which he maintained have since been triumphantly established, and have led to important results in other hands. He is to be regarded as the founder of that school of classical criticism of which Porson afterwards exhibited the chief excellences, as well as the chief defects; and which, though it was itself prevented by too strict attention to minute verbal detail from ever achieving much, yet diligently collected many of the facts which men of wider views are now grouping together, to form the modern science of comparative philology. B. died in 1742, leaving behind him one son, Richard, who inherited much of his father's taste with none of his energy, and several daughters, one of whom, Joanna, married, and was the mother of Richard Cumberland, the dramatist.—Monk's *Life of Richard Bentley*, 1830.

BENTON, a co. in n.w. Arkansas, bordering on Missouri and the Indian territory; 900 sq.m.; pop. '80, 25,419—196 colored. The chief business is agriculture. Co. seat, Bentonville.

BENTON, a co. in Indiana, bordering on Illinois; intersected by the Bloomington division of the Wabash, and the Cincinnati, Lafayette and Chicago railroads; 414 sq.m.; pop. '70, 5615. It has fertile prairie soil, with some forests. Co. seat, Oxford.

BENTON, a co. in Iowa, on the Cedar and Iowa rivers; intersected by the Burlington, Cedar Rapids and Northern, and the Chicago and Northwestern railroads; 720 sq.m.; pop. '75, 22,807; in '80, 24,888. Its surface is undulating prairie and woodland; chief business, agriculture. Co. seat, Vinton.

BENTON, a co. in Minnesota on the Mississippi river; intersected by the St. Paul and Pacific railroad; 400 sq.m.; pop. '75, 1974; in '80, 3017. It is an agricultural region, drained by St. Francis, Elk, and Little Rock rivers. Co. seat, Sauk Rapids.

BENTON, a co. in Mississippi on the Tallahatchie river and the Tennessee border; recently organized. Co. seat, Ashland.

BENTON, a co. in Missouri on the Osage river and its tributaries; 770 sq.m.; pop. '70, 16,322—320 colored. It is a good agricultural region, and has lead mines. Co. seat, Warsaw.

BENTON, a co. in Oregon, between Willamette river and the Pacific ocean; 1200 sq.m.; pop. '80, 6,403. The surface is mountainous, but good for grazing and the hardier grains. Co. seat, Corvallis.

BENTON, a co. in n.w. Tennessee on the T. river; crossed by the Nashville and Northwestern railroad; 400 sq.m.; pop. '70, 8234—452 colored; in '80, 9856; a good agricultural region. Co. seat, Camden.

BENTON, Thomas Hart, b. N. Y., Mar. 14, 1782; d. Washington, April 10, 1858. His family went to Tennessee, where he studied law and was elected to the legislature, where his first work was to reform the judiciary and to secure to slaves the right of trial by jury. In the war with England, B. was one of Jackson's aids, and raised a regiment of volunteers. In 1815, B. settled in St. Louis, and established the *Missouri Inquirer*, a journal that occasioned for him a number of duels, in one of which he killed his opponent. He advocated the admission of Missouri as a slave state, and after the famous compromise in 1820, was chosen U. S. senator. He was regularly re-elected, so that he was senator for 30 successive years, during all of which period he was conspicuous as a leader on almost every important question. One of his long prosecuted plans was to amend the constitution so that the people could vote directly for president, or come as near as possible to such a system. This project he brought forward several times, but it never came near adoption, all friends of caucus nominations and secret machine work in politics naturally opposing it. One of his hardest fights was in opposing the re-chartering of the U. S. bank, when he advocated the establishment of a currency of gold and silver only, for which idea he was long called "Old Bullion." After the charter had passed and president Jackson had vetoed it, the senate adopted a resolution censuring the president; but B., not long after, moved to expunge that resolution from the record, and carried his point after a long and fierce contest. Among other measures advocated by B. were the pre-emption of public lands, a railroad to the Pacific, the abolition of the salt-tax, and opening mineral lands to settlement. In the Oregon boundary question with Great Britain he took a leading part against the "fifty-four forty or fight" advocates, and his influence greatly conduced to the retreat of Polk's administration from an extreme position. He opposed the compromise measures of Henry Clay in 1850, and they were defeated as a whole, but adopted separately. He was friendly with Calhoun until the nullification episode, and thenceforth for a long period his enemy. Two years after his long service in the senate, B. was chosen to the other house, where he opposed the Kansas-Nebraska bill and failed of re-election on that account. In 1856, he was a candidate for governor of Missouri, through a "Native American" side issue. At the same election he supported Buchanan for president, although his own son-in-law, Fremont, was the opposing candidate. Col. Benton's *Thirty Years' View* is a well known and valuable political retrospect of his experiences and observations in the senate. He also made an *Abridgment of the Debates in Congress from* 1789 *to* 1856, in 15 large volumes.

BENTONVILLE, a village in Johnston co., N. C., where, Mar. 16, 1865, the confederates under Johnston undertook to capture the left wing of Sherman's army, then on the "march to the sea." They were resisted by gen. Slocum and Kilpatrick's cavalry, and failed. The union loss in killed and wounded was 1600; confederate loss not known, but there were 267 dead on the field and 1600 prisoners. Pop. '80, 1,076.

BENT TIMBER, produced by a modern method; usually made of planks bent to the desired curve and fastened together to form beams. A beam thus formed is stronger than if bent in a whole piece. At first the timber was steamed, but that course has been generally abandoned, as the steam injures the wood.

BE'NUE, or Bi'nué, or, as Dr. Barth prefers to spell it, Be'nuwé, called also Chadda and Tchadda, from the erroneous supposition that it was connected with lake

Tchad; an important river of central Africa, forming the eastern branch of the Quorra or Niger, which it joins about 230 m. above the mouth of that river in the gulf of Guinea. At its junction with the Faro, in lat. about 9° 33′ n., long. 12° 40′ e., the point where Dr. Barth crossed, he describes the B. as being 800 yds. across, with a general depth in its channel of 11 ft. and "a liability to rise under ordinary circumstances at least 30 ft., or even at times 50 ft. higher." In 1854, an expedition under the command of Dr. Baikie explored the B. as far as Dulti, a place about 350 m. above its confluence with the Niger, and some 80 or 100 m. from where Dr. Barth crossed. Dr. Barth regards this river as offering the best channel for the introduction of civilization into the heart of central Africa seeing that the tract of land which separates the basins of the B. and the Shari, which flows into lake Tchad, "cannot exceed 20 m., consisting of an entirely level flat, and probably of alluvial soil. . . . The level of the Tsad, and that of the river B. near Gewe, where it is joined by the Mayo Kebbi, seem to be almost the same." In the second expedition, undertaken in 1862, Dr. Baikie explored as far n. as Kano, in Haussa. The expedition of Dr. Nachtigall made in 1872 did not add much to our previous knowledge.

BENYOWSKY, MAURICE AUGUSTUS, Count de, a man of remarkable character and extraordinary fortunes, was born at Verbowa, in Hungary, 1741. He served in the seven years' war, and during his youth displayed that restless love of adventure which marked his subsequent career. He went to Dantzic for the purpose of studying navigation, and from thence made several voyages to Hamburg and Plymouth. When about to start for the East Indies in 1767, he received a pressing invitation to join the Polish confederation, with which he complied, and shared most of the dangers and glories of the campaign against the Russians until he was taken prisoner in May, 1769. After being transferred from one Russian prison to another, he was, in Dec., 1769, banished to Siberia, and from thence, in a few months, to Kamtchatka. During the voyage his exertions and skill saved the vessel that carried him. This recommended the prisoner to the governor, Nilov, who was further pleased by B.'s skill as a chess-player, and made him tutor in his family. In this capacity he gained the affections of Aphanasia, daughter of the governor, by whom he was assisted in his plans for escape; which, however, was not effected without a struggle, in which the governor was killed. B., with ninety-six companions, in a ship well armed and provisioned, and with a considerable amount of treasure, set sail from Kamtchatka in May, 1771. Having visited some of the islands of Japan and Formosa, B. arrived at Macao on the 22d of Sept., where he remained until the 14th Jan., and then sailed for France. He had not been here long when the French government proposed that he should found a colony at Madagascar, and he at once acquiesced. B. arrived on the island in Feb., 1774, and was made king in 1776 by the chiefs in conclave, he adopting the native costume. Returning to Europe with a view to establish commercial relations between France and Madagascar, B. met with a very cold reception from the French government, and returned to the service of Austria, in the hope that the emperor would assist him in his schemes—a hope not fulfilled. He next made unsuccessful overtures to the British government, but at length receiving assistance from private persons in England and America, departed again for Madagascar, where he arrived in 1785; and, involving himself in contention with the French government of the isle of France, was killed in battle, May 23, 1786. B. was a man of remarkable resources, great decision of character, courage, and sagacity. He was particularly well versed in human nature, a knowledge which proved of essential service to him during his brief but most remarkable career.—*Memoirs and Travels of Count. de Benyowsky, Written by himself and Edited by W. Nicholson* (2 vols. 4to. Lond. 1790),

BENZER'TA, LAKES OF, the ancient *Hipponitis Palus* and *Sizaræ Palus,* two lakes within the dominions of Tunis, from which town they are about 30 m. distant, in a n.w. direction. They are each about 9½ m. long, and the larger one, which is clear and salt, is about 5½ m. broad; the smaller, which is turbid and fresh, 3½. They are about 2 m. apart, but united by a channel with a general depth of 6 ft. and breadth of 75. Tunis is supplied with fish mainly from these lakes. So valuable is the fishing, that a wealthy Arab rents it from the bey of Tunis for £4000 per annum.

BENZIE, a co. in n.w. Michigan on lake Michigan; 440 sq. m.; pop. '74, 2663. The chief business is agriculture. Co. seat, Benzonia.

BENZILE, BENZOILE, or BENZOYLE, is the radical or root of the group of substances which comprehends as members the hydrate of benzoyle (oil of bitter almonds), benzoic acid, benzoin, and benzole. It is prepared by passing a stream of chlorine gas through fused benzoin, or by heating one part of benzoin with two parts of concentrated nitric acid. B. floats to the upper part of the liquid mixture as a liquid oil, which solidifies on cooling. B. is a tasteless solid, insoluble in water, but readily dissolved by ether and alcohol, and on concentration of the ethereal or alcoholic solution, the B. crystallizes in regular six-sided prisms, of a yellow color. When heated to 194° to 198° it fuses. Its composition is expressed by the chemical formula $C_{28}H_{10}O_4$, and many chemists name the substance possessing this formula *benzile,* reserving the title *benzoile* or *benzoyle* for a substance polymeric (see POLYMERISM) with benzile, which has not yet been isolated, but which may be represented by $C_{14}H_5O_2$.

BENZOIC ACID, or *the flowers of benzoin and benjamin*, occurs naturally in many balsamiferous plants, and especially in benzoin (q.v.), from which it may be readily obtained by several processes, which it is not necessary here to describe. B. A. is always in the form of snow-white, glistening, feathery crystals, with a fairy aspect of lightness. It has a very fragrant and pleasant aromatic odor, due to the presence of a trace of an essential oil, and a hot bitter taste. It is readily dissolved by alcohol and ether, but sparingly soluble in water. B. A. is one of the materials present in *tinctura camphoræ composita*, and has been administered in chronic bronchial affections; but the benefit derivable from its use in such cases is questionable. B. A. taken into the stomach, increases within 3 or 4 hours the quantity of hippuric acid in the urine. It forms a numerous class of compounds with the oxides of the metals, lime, etc., called benzoates. The chemical formula for crystallized B. A. is $HO,C_{14}H_5O_3$.

BENZOIN, BENJAMIN, or BENZOIC GUM, a fragrant resinous substance, formed by the drying of the milky juice of the benzoin or benjamin tree (*styrax*, or *lithocarpus benzoin*), a tree of the natural order *styracaceæ*, and a congener of that which produces STORAX (q.v.), a native of Siam, and of Sumatra, and other islands of the Indian archipelago. The tree grows to nearly 2 ft. in diameter; the smaller branches are covered with a whitish rusty down; the leaves are oblong, acuminate, and entire, downy and white beneath; the flowers are in compound racemes. B. comes to us in reddish-yellow transparent pieces. Different varieties, said to depend upon the age of the trees, are of very different price; the whitest, said to be the produce of the youngest trees, being the best. There is a variety known in commerce as *amygdaloidal benzoin*, which contains whitish almond-like tears diffused through its substance, and is said to be the produce of the younger trees. B. is obtained by making longitudinal or oblique incisions in the stem of the tree: the liquid which exudes soon hardens by exposure to the sun and air. B. contains about 10 to 14 per cent. of benzoic acid (q.v.); the remainder of it is resin. B. is used in perfumery, in pastilles, etc., being very fragrant and aromatic, and yielding a pleasant odor when burned. It is therefore much used as incense in the Greek and Roman Catholic churches. Its tincture is prepared by macerating B. in rectified spirit for 7 to 14 days, and subsequently straining, when the *compound tincture of benjamin, wound balsam, friar's balsam, balsam for cuts*, the *commander's balsam*, or *Jesuit's drops*, is obtained. It is frequently applied to wounds directly; or still better, when the edges of the wound are brought together, and bound with lint or plaster, the tincture of B. may be used as an exterior varnish. In the preparation of *court-plaster*, sarcenet (generally colored black) is brushed over with a solution of isinglass, then a coating of the alcoholic solution of benzoin. The tincture is likewise employed in making up a cosmetic styled *virgin's milk*, in the proportion of 2 drams of the tincture to 1 pint of rose-water; and otherwise it is used in the preparation of soaps and washes, to the latter of which it imparts a milk-white color, and a smell resembling that of vanilla. B. possesses stimulant properties, and is sometimes used in medicine, particularly in chronic pulmonary affections. It may be partaken of most pleasantly when beaten up with mucilage and sugar or yolk of egg. The name *ava dulcis* (q.v.) has sometimes been given to it, although it is not the substance to which that name seems properly to have belonged.—The milky juice of *terminalia benzoin*, a tree of the natural order *combretaceæ*, becomes, on drying, a fragrant resinous substance resembling B., which is used as incense in the churches of the Mauritius. It was at one time erroneously supposed that B. was the produce of *benzoin odoriferum*, formerly *laurus benzoin*, a deciduous shrub, of the natural order *lauraceæ*, a native of Virginia, about 10 to 12 ft. high, with large, somewhat wedge-shaped, entire leaves, which still bears in America the name of *benzoin*, or *benjamin tree*, and is also called *spice-wood* or *fever-bush*. It has a highly aromatic bark, which is stimulant and tonic, and is much used in North America in intermittent fevers. The berries are also aromatic and stimulant, and are said to have been used in the United States during the war with Britain as a substitute for pimento or allspice. An infusion of the twigs acts as a vermifuge.

BENZOIN ODORIFERUM, the benjamin tree or spice bush, properly *lindera benzoin* of the laurel order. It has an aromatic bark, used as a tonic and stimulant in intermittent fevers.

BENZOLE, BENZINE, or PHENE, is a compound of carbon and hydrogen ($C_{12}H_6$), formed during the destructive distillation of coal (see GAS; COAL), and found dissolved in the naphtha which is condensed from the vapors evolved from the gas retort. It may be prepared from coal-tar naphtha by subjecting the tar to a temperature of 32° F., when the B. solidifies, while the other naphtha constituents remain liquid. Two gallons of the naphtha yield a pint of pure rectified benzole. It can also be obtained (1) by subjecting oil-gas to a pressure of 30 atmospheres; (2) by the dry distillation of kinic acid (q.v.); and (3) by cautiously heating a mixture of one part of benzoic acid and three parts of quicklime, when the material which distills over is impure benzole. At ordinary temperatures, B. is a thin, limpid, colorless liquid, evolving a characteristic and pleasant odor. At 32° F., it crystallizes in beautiful fern-like forms, which liquefy at 40°; and at 177°, it boils, evolving a gas which is very inflammable, burning with a smoky flame. It readily dissolves in alcohol, ether, turpentine, and wood-spirit, but is insoluble in water. It is valuable to the chemist from the great power it possesses of dissolving

caoutchouc, gutta-percha, wax, camphor, and fatty substances. It is thus of service in removing grease-stains from woolen or silken articles of clothing. When heated, it also dissolves sulphur, phosphorus, and iodine. B., when acted upon by chlorine, nitric acid, etc., gives rise to a very numerous class of compounds.

BENZOYLE, HYDRIDE OF, is the volatile or essential oil belonging to the benzoic series. It is represented by the formula $C_{14}H_5O_2,H$, and has been already considered under ALMONDS, VOLATILE OIL, or ESSENTIAL OIL OF (q.v.).

BEOWULF, an Anglo-Saxon epic poem, which is one of the greatest literary and philological curiosities, and one of the most remarkable historical monuments in existence. The date of the events described is probably about the middle of the 5th c.; and as the legends refer to the Teutonic races which afterwards peopled England, it is believed that the poem, in its original shape, was brought by the Anglo-Saxons from their original seats on the continent. Only one MS. of the poem is known to exist; that, namely, in the Cottonian library, which was seriously injured by the fire of 1731. This MS. consists of two portions, written at different times and by different hands, and is manifestly a copy, executed perhaps about the beginning of the 8th c., from an older and far completer version of the poem. But, even in the form in which it came from the hands of its last recaster, B. is the oldest monument of considerable size of German national poetry, and notwithstanding the Christian allusions which fix the existing text at a period subsequent to 597 A.D., a general heathen character pervades it, which leaves little doubt as to the authentic nature of the pictures which it presents of Teutonic life in ante-Christian times. Much learned labor has been bestowed on this strange relic by Sharon Turner (*Hist. of Anglo-Saxons*, vol. iii.); Conybeare (*Illustrations of Anglo-Saxon Poetry*); Dr. G. J. Thorkelin of Copenhagen, who first published the entire work in 1815; and above all, by Mr. Kemble, whose beautiful edition was published by Pickering in 1833, and was followed in 1837 by a translation, with glossary, preface, and philological notes.

At first Mr. Kemble was disposed to regard B. as an historical epic, but his view of it latterly came to be, that though to some extent historical, it must be regarded, in so far as the legends are concerned, as mainly mythological; and this remark he conceived to apply to the hero not less than to the incidents related. But Beowulf, the god, if such he was, occupies only a small space in the poem, and seems to be introduced chiefly for the purpose of connecting Hrothgar, king of Denmark, whom Beowulf, the hero, comes to deliver from the attacks of the monster Grendel, with Scef or Sceaf, one of the ancestors of Woden, and the common father of the whole mythical gods and heroes of the north. Sceaf is traditionally reported to have been set afloat as a child on the waters, in a small boat or ark, having a *sheaf* (Ang.-Sax. sceaf) of corn under his head; whence his name. The child was carried to the shores of Slesvig, and being regarded as a prodigy, was educated and brought up as king. Between Sceaf and Beowulf, Scyld intervened, according to the opening canto of the poem; but when compared with kindred traditions, the whole genealogy becomes involved in extreme obscurity, and Scyld seems sometimes to be identified with Sceaf, and sometimes with Woden. But the view of the connection between Beowulf and Sceaf is strengthened by the following considerations. The old Saxons, and most likely the other conterminal tribes, called their harvest month (probably part of Aug. and Sept.) by the name Beo or Beowod, in all probability their god of agriculture or fertility. Whether, or to what extent, this divinity is identical with the mythical hero of the poem, Mr. Kemble does not venture to determine, though he indicates a strong leaning to the affirmative.

But in so far as the main points of historical interest are concerned—viz., the [illegible] of the legends, and the race and regions to which they belong—the results of the historical and of the mythological view seem to be pretty nearly the same. The poem falls entirely out of the circle of the northern sagas, and probably belongs to Slesvig. All the proper names are Anglo-Saxon in form, but not the slightest mention is made of Britain, the Ongle mentioned being manifestly Angeln (see ANGLES), and not Anglia. From this and many other considerations, the learned editor infers that B. records the mythical beliefs of our forefathers; and in so far as it is historical commemorates their exploits at a period not far removed in point of time from the coming of Hengest and Horsa, and that in all probability the poem was brought over by some of the Anglo-Saxons who accompanied Cerdic and Cyneric, 495.

The poem opens with an incident which reminds us of one of the most beautiful of Mr. Tennyson's earlier poems, the *Mort d'Arthur*, and seems to show a similarity between British and Germanic traditions. We give it in the simple words of Mr. Kemble's prose translation.

"At *his* appointed time then Scyld departed, very decrepit, to go into the peace of the Lord; they then, his dear comrades, bore him out to the shore of the sea, as he himself requested, the while that *he*, the friend of the Scyldings, the beloved chieftain, had power with *his* words; long he owned it! There upon the beach stood the ring-prowed *ship*, the vehicle of the noble, shining like ice, and ready to set out. They then laid down the dear prince, the distributer of rings, in the bosom of the ship, the mighty one beside the mast; there was much of treasures, of ornaments, brought from afar. Never heard I of a comelier ship having been adorned with battle-weapons and with war-weeds, with bills and mailed coats. Upon his bosom lay a multitude of treasures which were

to depart afar with him, into the possession of the flood. They furnished him not less with offerings, with mighty wealth, than those had done who in the beginning sent him forth in his wretchedness, alone over the waves. Moreover they set up for him a golden ensign, high overhead; they let the deep sea bear *him;* they gave *him* to the ocean. Sad was their spirit, mournful *their* mood. Men know not in sooth to say (men wise of counsel, *or any* men under the heavens) who received the freight."

The following is a brief outline of the story: B. is introduced to us, preparing for a piratical adventure. After a vivid description of the embarkation of the hero and his "friendly Scyldingi," the scene changes, and the palace of Hrothgar rises before us. Here the Danish king has assembled his warriors, and holds a feast, unconscious of the deadly peril in which he is placed. The "scop" ("shaper," from *scapan*, "to shape" or "create") sings a poem on the origin of things, and how evil came into the world. This is deftly used to bring upon the stage the "grim stranger Grendel, a mighty haunter of the marshes, one that held the moors, fen, and fastness, the dwellings of the monster-race." Malignant and cruel, he hears with envious hate the sounds of joy echoing from the hall, and stealing into the palace after dark, when the revel is over, he seizes and destroys thirty of the sleeping thegns. In the morning, when the havoc wrought by Grendel becomes known, there is a fierce outcry, and Hrothgar is loudly blamed. Yet twelve winters pass by before the outrage is avenged. The king is continually "seethed in the sorrow of the time;" but help is at hand. B. has heard of the crimes of the monster, and comes with his Geats (Jutes) to inflict punishment. The voyage over the waves, and the landing of the brave adventurers on the shores of Hrothgar's dominions, is finely told. After some parley with the coast-guards, an interview takes place between the monarch and the hero, who almost pleads to be allowed to deliver the land from the ravages of Grendel. Most tender and pathetic is the passage in which he asks—if fortune should be adverse to him ("if Hilda"—i.e. "the goddess of slaughter"—"should take him away"), that they would not mourn over the "solitary rover," but plant a "simple flower" on his cairn, and send back his "garments of battle" to his lord and kinsman, Higelac. The inevitable feast follows, in the course of which the "scop" sings of the peace that is to be, and B. enlarges upon his past exploits. Then we have an exquisite picture of the Danish queen: "There was laughter of heroes, the noise was modulated, words were winsome; Wealtheow, Hrothgar's queen, went forth; mindful of their races, she, hung round with gold, greeted the men in the hall; and the free-born lady gave the cup first to the prince of the east Danes; she bade him be blithe at the service of beer, dear to his people. He, the king, proud of victory, joyfully received the feast and hall-cup. The lady of the Helmings then went round about every part of young and old; she gave treasure-vessels, until the opportunity occurred, that she, a queen hung round with rings, venerable of mood, bore forth the mead-cup to Beowulf. Wise of words, she greeted the Geat, she thanked God because her will was accomplished, that she believed in any earl, *as* a consolation against the crimes." That night, when the shadows of darkness have fallen, Grendel comes swiftly to the palace from the misty moors, and assails Beowulf. A fierce struggle ensues, but the monster is baffled, and obliged to flee. Next day a second feast is held in honor of the hero's success, magnificent gifts are showered upon him by the grateful Hrothgar, the services of the "scop" are again called into request, music and sports follow, and the queen once more moves through the crowd of warriors with courtesy and grace. The night, however, is not to pass without its tragedy. The mother of the monster secretly enters, and destroys one of the king's dearest thegns. B., in a magnanimous speech, undertakes to avenge him. Having sought the wild haunts of the "hateful one," he first slays the mother after a furious combat, in which he would have been vanquished but for the apparition of a magic sword "over the waves," which came into his grasp. Grendel is then destroyed, and his head carried off as a present to Hrothgar. B. then returns home, and after a variety of other but less interesting adventures, succeeds to the throne on the death of his kinsman Higelac. More recent editions than those above noted are that by Heyne (1863, 3d ed. 1873); and the admirable English one of Thomas Arnold, published with translation, notes, and appendix in 1876. Wackerbarth (1849) and Thorpe (1855) have given English metrical translations; the best German versions are those of Simrock (1859), Heyne (1863), and Von Wolzogen (1873).

BEPUR, or BEYPORE, a seaport of western India, 6 m. s. of Calicut. Its situation is very beautiful. It has a considerable trade in timber, particularly teak, which is floated down the river for exportation. Iron ore is found in the neighborhood, and iron-works have recently been established here. B. is the terminus of a railway across the peninsula of India from Madras by way of Coimbatore, and will probably soon become a place of great importance. Pop. in 1871, 5858.

BEQUEATH, to leave personal property by will or testament to another. In the case of *real* estate, the proper term to employ is *devise*. But although it is usual and safe so to use these words, neither of them is essential to the validity of an English will, but other words, showing clearly the intention of the testator, will suffice. In the Scotch law, the term B. can only apply to *personal* estate. Real estate, indeed, according to the existing regulations of that system, cannot be left or conveyed by will or testament; a testamentary disposition or settlement, expressed in certain technical terms of present

conveyance, being necessary for the purpose. See WILL; LEGACY; DISPOSITION (*mortis causâ*); SETTLEMENT; REAL; PERSONALITY.

BEQUEST, a legacy of personal property left by will. See BEQUEATH and its references.

BÉRANGER, JEAN-PIERRE DE, a celebrated French poet, was b. in Paris, 19th Aug., 1780, in the house of his grandfather, a tailor in the Rue Montorgueil, to whose care he was left entirely by his father, a scheming and not over-scrupulous financier. After living some time with an aunt at Péronne, to whom he appears to have been indebted for those republican principles which afterwards made him so obnoxious to successive French governments, B., at the age of 14, was apprenticed to a printer in that place, where he remained three years, devoting all his leisure hours to the acquirement of knowledge. He now returned to Paris, where his father, a zealous royalist, was engaged in some questionable schemes of money-getting, which were mixed up with conspiracy. B. assisted him in his money affairs, so far as he honorably could, and kept his political secrets; but he did not disguise his contempt for the royalist cause, nor fail to express his opposite sympathies. The business, however, was not one to the taste of B., who was throughout the whole of his life a man of the most sensitive honor, and he soon left it. He had ere this begun to write, but his poems were not successful; and reduced almost to destitution, he, in 1804, inclosed some of his verses to M. Lucien Bonaparte, with a letter explaining his circumstances, and with a request for assistance—the one solitary instance of solicitation during a long life of independence, marked by the refusal of numerous offers of lucrative patronage. The appeal was not made to a deaf ear. M. Bonaparte obtained employment for the poet, first as editor of the *Annales du Musée*, and afterwards as a subordinate secretary in the university; a post which he held for 12 years, when the government, provoked at his satire, and alarmed at his popularity, dismissed him. During the "hundred days," Napoleon offered B. the remunerative post of censor—a singular office for such a man. He refused it. But though he scorned to accept favor from, or to flatter Napoleon, at a time when it was alike fashionable and profitable to do so, he was of much too noble a nature to join in the sneers and reproaches which greeted the hero on his fall. Above the fear of power, he was incapable of taking advantage of misfortune. In 1815, B. published his first collection of songs, which soon attained a very wide popularity. In 1821, he published another collection, which was followed shortly after by some fugitive pieces, which subjected him to a government prosecution, a sentence of three months' imprisonment, and a fine of 500 francs. In 1825, a third collection, and in 1828, a fourth appeared, still more withering in its sarcasm on those in power; and the penalty of B.'s outspokenness was a fine of 10,000 fr., and nine months' confinement in La Force. The fine was soon paid by the poet's friends, and his prison became the resort of the most eminent men in the kingdom, and a very armory in which he forged those keen-piercing bolts which galled so terribly, and contributed so much to the overthrow of the Bourbons. But B. refused to profit by the new state of things he had been instrumental in bringing about. Rejecting the emoluments and honor which his friends, now in power, were anxious to bestow, he retired to live in privacy at Passy. In 1833, he published a fifth collection of songs, when he took a formal leave of the public; and from that time until the day of his death, 24 years after, he remained silent. In 1848, B. was elected a member of the assemblée constituante by more than 200,000 votes; but after taking his seat, to show his appreciation of the honor conferred on him, he almost immediately resigned. He consistently rejected all the offered favors of the late emperor, as well as a graceful overture on the part of the empress, which he owned it cost him much to refuse. B. died at Paris, July 17, 1857. The cost of his funeral was defrayed by the French government, and his remains were attended to the grave by the most distinguished men in all departments of literature. B. was as emphatically the poet of the French people as Burns was the bard of the Scottish peasantry. The same stanch and fearless independence, genuine manliness, sound common-sense, and contempt for everything mean and hypocritical, characterized both men; and as poets, they differ in excellence only as the sentiments of the French and Scottish people differ in their capacity to be turned into song. "Neither friend nor enemy has as yet disclosed to us any speck on the heart, the honor, the genius, or the good sense of Béranger." Since his death, his *Last Songs*, written between 1834 and 1851, have been published, and also *My Biography* (Paris, M. Perrotin; London, Jeffs). See *My Biography; Mémoirs of Béranger*, by M. Lapointe; and *Béranger et son Temps*, by Jules Janin (1866).

BERAR', a valley situated locally in the Nizam's territories, but annexed politically to British India, for the maintenance of what is called the Nizam's contingent. It is bounded on the n. by a detached portion of Scindia's dominions and the Nerbudda provinces; on the e. by Nagpoor; on the w., by Candeish; and on the s., by two of the Nizam's remaining districts—Maiker Bassim and Mahur. It lies between 20° 15′ and 21° 40′ n. lat., and between 76° and 78° 2′ e. long, having an area of 16,960 sq. miles. Pop. '68, 2,231,565. It is traversed in its length by the Poornah—itself a tributary of the Taptee—which, with its numerous affluents, affords an ample supply of water to the valley, and, on other grounds, is peculiarly suitable to the cultivation of cotton. The transfer in 1853 from the Nizam to the British has proved favorable to this production; about 25

per cent of the area is devoted to cotton. In the e. part there is a coal-field of 40 sq.m., and at Akolah, in Purana, there are salt wells fed by a subterranean lake. Though Ellichpore is the chief town, yet it is inferior to Oomrawutti.

BÉRARD, FRÉDÉRIC, 1789–1828; a French physician and writer on physiology, educated at Montpellier, and employed in Paris on the *Dictionary of Medical Sciences*. He held a chair of medicine in Paris, and was a professor of hygiene in Montpellier, where he died from excessive work at the age of 39. His most important work is *Des Rapports du Physique et du Moral*, in which he holds that the soul and the principle of life are in constant reciprocal action, and the first owes to the second not the formation of its faculties, but the conditions under which they are evolved.

BERAT', a t. of Albania, European Turkey, in the vilayet of Janina, situated on the banks of the Usumi, about 30 m. n.e. of the seaport of Avlona. Pop. 8000 to 10,000, two thirds of whom are Greeks; the remainder Turks. The valley in which B. stands is very fertile, producing large quantities of grain, oil, and wine. B. has a citadel, and traces of ancient Greek buildings, and gives title to a Greek archbishop.

BERBER, EL MEKHEIR, or EL MESHERIF, a t. on the e. bank of the Nile, below the confluence of the Atbara, about 18° n., 34° e. It is important only as one of the main stations on the direct route from Khartoum to Cairo, and as the starting-place for caravans going to Suakin, on the eastern coast. Pop., estimated, 8000.

BER'BERA, a seaport station of Somali, eastern Africa, with a good harbor, on a bay of the gulf of Aden. Lat. 10° 26′ n., long. 45° 8′ e. It is celebrated as the scene of a large annual fair, which brings nearly 20,000 people together from all quarters in the east. Coffee, grains, ghee, gold-dust, ivory, gums, cattle, ostrich-feathers, slaves, etc., are brought down to this place from the interior on strings of camels, sometimes numbering as many as 2000, and exchanged for cotton, rice, iron, Indian piece-goods, etc. As soon as the fair—which usually extends from Nov. to April—is over, the huts are carefully taken down, and packed up, and nothing remains to mark the site of the town but the bones of animals slaughtered for food during the continuance of the fair.

BERBERID'EÆ, or BERBERIDA'CEÆ, a natural order of exogenous plants, of which the different species of barberry (q.v.) afford the best known examples. Many of the plants of this order are spiny shrubs; some are perennial herbaceous plants. Their leaves are alternate, their flowers sometimes solitary, sometimes in racemes or panicles. The calyx consists of 3, 4, or 6 deciduous sepals; the corolla, which arises from beneath the germen, consists of petals equal in number to the sepals, and opposite to them, or twice as many; the stamens are equal in number to the petals, and opposite to them; the anthers are 2-celled, each cell opening curiously by a valve which curves back from bottom to top; the carpel is solitary and 1-celled; the fruit is either a berry or a capsule. This order, which is nearly allied to *vitaceæ* (q.v.), (vines, etc.), contains more than 100 known species, chiefly belonging to the temperate parts of the northern hemisphere, and of South America.

BERBERINA, or BERBERINE, an alkaloid in the barberry, columbo, yellow root, and other plants, appearing in minute yellow crystals of bitter taste. Its formula is C_{40},H_{17},NO_8. There is an impure muriate called hydrastin, sometimes used as a medicine.

BERBERS, the general name usually given to the tribes inhabiting the mountainous regions of Barbary and the northern portions of the great desert. It is derived, according to Barth, either from the name of their supposed ancestor, *Ber*, which we recognize in the Lat. *A-fer*, an African (see letter B); or from the Greek and Roman term *Barbari*. The name by which they call themselves, and which was known to the Greeks and Romans, is Amázigh, or Mazigh, Mazys, Amoshagh, Imoshagh, etc., according to locality, and whether singular or plural. These tribes have a common origin, and are the descendants of the aboriginal inhabitants of northern Africa. They appear to have been originally a branch of the Semitic stock; and although they have been conquered in succession by the Phœnicians, Romans, Vandals, and Arabs, and have become, in consequence, to some extent, a mixed race, they still retain, in great part, their distinctive peculiarities. Till the 11th c., the B. seem to have formed the larger portion of the population inhabiting the southern coast of the Mediterranean, from Egypt to the Atlantic ocean; but, on the great Arab immigrations which then took place, they were driven to the Atlas mountains, and to the desert regions where they now live. In Tripoli, the allegiance they pay to the Turks is little more than nominal; in Algeria, where they usually are termed Kabyles, they are yet unconquered by the French; and in Morocco, where they are called "Shellooh," they are only in form subject to the emperor. The B. occupying the desert, who are called Tuaric, or Tawarek, by the Arabs, have become much mixed with the negro race. The number of the B. is estimated at between three and four millions. They are of middle stature, sparely but strongly built. The complexion varies from a red to a yellow brown, and the shape of the head and the features has more of the European than the oriental type. The hair is, in general, dark, and the beard small. The eyes are dark and piercing. Their manners are austere, and in disposition they are cruel, suspicious, and implacable. They are usually at war, either with their neighbors or among themselves; are impatient of

restraint; and possessed of a rude, wild spirit of independence, which makes it impossible for them to unite for any common purpose, or to make the advances in civilization which one might otherwise expect from their high physical organization. They live in clay-huts and tents; but, in their larger villages, they have stone-houses. They have herds of sheep and cattle, and practice agriculture, and are especially fond of the cultivation of fruit-trees. They possess water-mills and oil-presses. The mines of iron and lead in the Atlas are wrought by them, and they manufacture rude agricultural implements, as well as swords, guns, and gunpowder. They formerly professed the Christian religion; but since the Arabs drove them from the fertile plains between the mountains and the sea, they appear to have retrograded in every way, and they are now among the most bigoted adherents of the religion of Mohammed; although their former creed has left a few traces, as in the names *Mesi* for God, and *angelus* for angel, and many curious customs still observed among them. See Barth's *Africa*, vol. i.

BERBICE, the eastern division of British Guiana, is bounded w. by Demerara; n. by the Atlantic; e. by Dutch Guiana or Surinam; and s. by the basin of the Amazon, or rather, perhaps, the upper waters of the Surinam and Corentyn. In 1796, Berbice, Demerara, and Essequibo were surrendered to the British under maj gen. Whyte, but were soon after restored to the Dutch at the peace of Amiens, and recaptured in 1803. B. stretches in long. between 55° 40′ and 57° 20′ w., and in lat. southward from 6° 30′ north. It is subdivided into six parishes, four of which belong ecclesiastically to the Scotch national church, and two to the Episcopalian. Pop. about 32,000, of whom nearly 4000 are white and of mixed race. The principal products are sugar, coffee, cocoa, and tropical fruits. Cotton has all but ceased to be grown. The forests abound with splendid timber trees, including the mora, bullet-tree, and cedar. The Berbice river, though not the largest in British Guiana, is navigable to the greatest distance from the sea. The Essequibo discharges a greater volume of water, but is interrupted by rapids within 50 m. of the coast, while the Berbice admits a draught of 12 ft. for 100 m., and one of 7 ft. for 60 more, the influence of the tide reaching nearly the whole way. Even as far as lat. 3° 55′ n., 175 m. in a straight line from its outlet, it has been found to have a width of 100 ft., with a depth of from 8 to 10. An important affluent is the Canje, on the banks of which a number of the most important plantations are situated. New Amsterdam, on the right bank of the Berbice river (pop. 7000), is the chief town and port of the district.

BERCETO, a t. of Italy, in the province and 25 m. s.w. from the city of Parma, beautifully situated amongst the Apennines. It is a clean, well-built town. The church is an old Gothic building. The mountains rise rapidly to the w. of B., and some of the scenery which they present is very wild and desolate.

BERCHTA (in old German, Peracta, and the original form of the name Bertha, being from the same root as the English word *bright*, and meaning "shining," "white") is, in German mythology, the name given in the s. of Germany and in Switzerland to a spiritual being, who was apparently the same as the Hulda (gracious, benign) of northern Germany. This being represented originally one of the kindly and benign aspects of the unseen powers; and so the traditions of Hulda (q.v.) in the north continued to represent her. But the B. of the south, in the course of time, became rather an object of terror, and a bugbear to frighten children; the difference probably arising from the circumstance, that the influence of Christianity in converting the pagan deities into demons was sooner felt in the south than in the north. Lady B. has the oversight of spinners. The last day of the year is sacred to her, and if she find any flax left on the distaff that day, she spoils it. Her festival is kept with a prescribed kind of meager fare—oat-meal-gruel, or pottage, and fish. If she catches any persons eating other food on that day, she cuts them up, fills their paunch with chopped straw and other such agreeable stuffing, and then sews up the wound with a plowshare for a needle, and an iron chain for a thread. In some places, she is the queen of the crickets. She is represented as having a long iron nose and an immensely large foot. That she was once an object of worship, is testified by the numerous springs, etc., that bear her name in Salzburg and elsewhere. It is likely that many of the sagas of B. were transferred to the famous Berthas (q.v.) of history and fable. The numerous stories of the "White Lady" who appears in noble houses at night, rocks and nurses the children while the nurses are asleep, and acts as the guardian angel of the race, have doubtless their root in the ancient heathen goddess Berchta.

BERCHTESGADEN, a principality of Bavaria, adjoining the Austrian duchy of Salzburg, and forming the extreme s.e. corner of the German empire; 155 sq.m.: pop. 9500. It is a rough mountain region, unfit for agriculture or even pasturage; but the scenery is magnificent. The Konig's lake, nearly surrounded by mountains, has on its shore at St. Bartholoma, a chapel much frequented by pilgrims. There is also a chapel of ice. The main industry of the people is the manufacture of toys, known in commerce as Berchtesgaden wares.

BERCHTESGADEN, a village of Bavaria, charmingly situated on a mountain slope, about 15 m. s. of Salzburg. Pop. '71, 1763. It has a royal hunting-lodge, but the place is most remarkable for its government salt-mines, from which 150,000 cwt. of rock-salt

is annually obtained. During the residence of the court, the mine is sometimes illuminated, and its chambers are then seen to great advantage.

BERCY, a t. of France, in the department of the Seine, situated on the right bank of the river of the same name. B. forms a suburb of Paris, and its population is reckoned as a portion of that of the capital. It has a large business in wines and other liquors.

BERDIANSK, a well-built seaport town of southern Russia, government of Taurida, on the northern coast of the sea of Azov. B. has the finest roads in the sea of Azov, and is a place of commercial activity, being the entrepot for the products of surrounding governments. It trades in fish, wood, hides, tallow, grain, coal, and salt; there are extensive coal-mines and salt-lakes in its vicinity. Pop. '67, 12,465. In 1855, during the Crimean campaign, capt. Lyons destroyed government property to a large amount, but the town was spared.

BERDITCHEV', a t. of Russia, in the government of Kiev, famous for its five annual fairs. At these, cattle, corn, wine, honey, leather, etc., are disposed of. The average annual value of the sales is £600,000. Pop. '67, 52,786, chiefly Jews.

BEREA COLLEGE, in Madison co., Ky., 40 m. s. of Lexington, was originated by John G. Fee, a minister, son of a slaveholder, but a zealous opponent of the system. For this opposition his father and his church disowned him. Always under suspicion, the college was suppressed, after the John Brown affair, and its officers were driven from the state. After peace it was revived, and has prospered greatly, having an annual average of nearly 300 students, of whom about 60 per cent are males and about 60 per cent colored persons. There has never been any trouble about color or sex in the institution. The curriculum is about the same as in other colleges. The college was opened in 1858. At last report there were the president, Rev. E. H. Fairchild, and 12 professors and instructors, and 31 students of the college grade.

BEREANS, an almost extinct sect of Christians, who originated in Scotland in the 18th century. Their name is derived from the circumstance that the inhabitants of Berea "received the word with all readiness of mind, and searched the Scriptures daily."—Acts xvii. 11. The founder of the B. was the Rev. John Barclay, a native of Perthshire, b. 1734, d. 1798. From him they also received the name of Barclayans. They believe that the knowledge of God's existence and character is derived from the Bible alone, and not from reason or nature; that the Psalms of David do not relate to David at all, but exclusively to Christ; that assurance is of the essence of faith; and that unbelief is the unpardonable sin. In the ordinary points of doctrine they are Calvinistic.

BEREGH, a co. in Hungary, s.w. of Galicia; 1429 sq.m.; pop. '70, 159,223, about half Ruthenians, and the remainder Magyars, with the exception of 8000 Jews, Germans, etc. It is mountainous and barren in the n., but fertile in the s., producing excellent wine. Capital, Berigszasz; pop. 6272.

BERENGAR I., King of Italy, was the son of Eberhard, duke of Friuli, and of Gisela, the daughter of the emperor Louis the pious. He and Guido, duke of Spoleto, were the two most powerful and ambitious nobles in Italy at the close of the 9th century. After the deposition of Charles the fat in 887, B., Guido, and Adalbert, count of Tuscany, became candidates for the Carlovingian throne. B. was crowned king of Italy at Pavia in 888, while Guido attempted to secure the realm of France. The former soon irritated the nobles against him by condescending to hold his territory in fief from Arnulf, king of Germany, against whom he found it vain to maintain his independence; and when Guido returned from his unsuccessful expedition to France, he was persuaded to put himself in opposition to B., and was chosen king of Italy. With the help of Arnulf, however, B. ultimately prevailed. After the death of Guido in 894, his son Lambert compelled B to share with him the sovereignty of n. Italy; but, on the assassination of Lambert in 898, B. contrived to obtain possession of the whole of Lombardy. His influence quickly sank. He could check neither the plundering incursions of the Hungarians across the Alps in the n., nor those of the Arabs, who laid waste the shores of the south. The nobles now called in Louis, king of lower Burgundy, who was crowned at Rome in 901; but he proved no better, and was finally overpowered by Berengar. In 915, B. was crowned emperor by pope John X.; but the nobles, who appear to have kept themselves during his reign in a state of chronic disaffection, again revolted, and, in 919, placed themselves under the banner of Rodolf of Burgundy, who completely overthrew B. on the 29th July, 923. The latter, in his extremity, called in the Hungarians to his aid, which unpatriotic act alienated the minds of all Italians from him, and cost him his life, for he was assassinated in the following year, 924.

BERENGAR II., the son of Adalbert, count of Ivrea, and grandson of Berengar I., succeeded to his father's possessions in 925, and married Willa, niece of Hugo, king of Italy, in 934. Incited by his ambitious and unscrupulous wife, he conspired against Hugo, and in consequence was compelled to flee to Germany, where he was received in a friendly manner by the emperor Otto I. In 945, he recrossed the Alps at the head of an army. The nobles and the townspeople both welcomed him; but, instead of assuming the crown himself, he handed it over to the weak Lothaire, the son of Hugo. On the

death of Lothaire, who was probably poisoned by Willa, B. allowed himself to be crowned along with his son Adalbert, in 950. To establish himself firmly in his new position, he wanted Adelheid, the youthful widow of Lothaire, to marry his son. She refused, and was subjected to a most cruel imprisonment, but ultimately found a helper and husband in the emperor Otto himself, who, at the imperial diet of Augsburg in 952, compelled B. to acknowledge Italy to be a fief of the German empire. B. soon after engaged in war with the emperor, who sent his son Ludolf against him. Ludolf was successful, but died in 957, of poison administered, as was believed, by Willa. B. again mounted the throne, but behaved with such intolerable tyranny that his subjects and pope John XII. called in the aid of the emperor, who marched into Italy in 961, and took possession of the country. B. took refuge in a mountain-fortress, where he held out till 964, when hunger compelled him to capitulate. He was sent as a prisoner to Bamberg, in Bavaria, where he died in 966. His wife, Willa, retired into a convent, and his three sons died in exile.

BERENGARIUS OF TOURS, a distinguished scholastic theologian, was b. at Tours, in France, 998 A.D. His master, Fulbert de Chartres, is reported to have prophesied on his death-bed that Berengarius would prove a dangerous man. In 1030, he was appointed preceptor of the school of St. Martin, in Tours, and in 1040, made archdeacon of Angers. Here he continued to deliver his metaphysico-theological prelections, and drew upon himself the charge of heresy, in reference to the doctrine of transubstantiation. He held the doctrine of Scotus Erigena, that the bread and wine in the sacrament of the eucharist remained bread and wine, and that the faith of the believer who recognized their symbolic meaning only transformed them subjectively into the body and blood of Christ. This interpretation was condemned by pope Leo IX., 1049–1050, and also by king Henry I. of France. In 1054, he retracted his opinion before the council of Tours, but what Berengarius meant by "retractation" it is not easy to see, for he immediately returned to his conviction, and recommenced the advocacy of it. For this he was cited to appear at Rome, where he repeatedly abjured his "error," but never seems to have really abandoned it. Hildebrand, who was then pope, treated him with great moderation; and at last, when he discovered how hopeless it was to bind down Berengarius by abjurations or declarations, he conceived it best to let him alone. Harassed and weakened by the attacks of the orthodox party, headed by Lanfranc of Canterbury, he finally retired to the isle of St. Cosmas, near Tours, in 1080, where he spent the last years of his life in devotional exercises. He died in 1088. The greater number of his works are lost; such as are extant have been collected and published by the Vischers (Berlin, 1834).

BERENICÉ, the name of several celebrated women of ancient times.—1. B., daughter of Lagus and Antigone, and the second wife of the Egytian king, Ptolemy I. (Soter), (323–284 B.C.). She is described by Plutarch as the first in virtue and wisdom of the wives of Ptolemy. Theocritus celebrates her beauty, virtue, and deification in his *Idyls* 15 and 17.—2. B., daughter of Ptolemy II. (Philadelphus) and Arsinoë, was married to Antiochus II. of Syria, after he had divorced his wife Laodice, whom, however, he again took back, putting B. away. Laodice having no faith in her husband, poisoned him, and caused B. and her son to be murdered.—3. B., daughter of Magas, king of Cyrene, granddaughter of B. No. 1, was to have been married to Demetrius the fair, but he having slighted her for her mother, she caused him to be murdered, and then went to Egypt and married Ptolemy III. (Euergetes), in accordance with the terms of a treaty between her father and Ptolemy II. During the king's wars in Asia, the queen B. made a vow to offer her beautiful hair to the gods when her husband returned safely—a vow which she fulfilled. The hair was suspended in the temple of Venus, whence, it is said, it was taken away to form a constellation, *Coma Berenicæ*. B. was put to death by her son, Ptolemy IV. (Philopator), when he succeeded to the throne.—4. B., also called Cleopatra, daughter of Ptolemy IX. (Lathyrus), was, on her succession to the throne, married to Alexander II., by whom she was murdered 19 days after marriage.—5. B., daughter of Ptolemy XI. (Auletes), eldest sister of the renowned Cleopatra, was raised to the throne after her father's deposition, 58 B.C., but was put to death when her father was restored, 55 B.C. She was first married to Seleucus, whom she caused to be put to death, and afterwards to Archelaus, who was put to death with her.—There were, besides, two Jewish Berenices—the one, daughter of Salome, sister of Herod the great and Costobarus, and mother of Agrippa I.; the other, and more famous, was daughter of this monarch. She was three times married: first, at a very early age, to Marcus, son of Alexander the Alabarch; afterwards to her uncle, Herod, king of Chalcis, who dying, left her for the second time a widow, at the age of 20; and again to Polemon, king of Cilicia, whom she soon deserted to return to her brother, king Agrippa II., the same before whom Paul defended himself at Cesarea. After the capture of Jerusalem, she went to Rome, and Titus, who was much in love with her, would have married her but for the opposition of the people. The intimacy of B. and Titus forms the subject of a tragedy by Racine.

BERENICÉ (modern name, Sakáyt-el-Kublee, "Southern Sakáyt"), a t. of Egypt, on a bay in the Red sea, 20 m. s.w. of Ras Bernass. It was founded by Ptolemy Philadelphus, and was in ancient times the emporium of the trade with India, but it is

now ruined, and interesting only for its antiquities, which include hieroglyphics, sculptures, and a temple dedicated to Serapis. There are emerald mines in its vicinity that have been worked since the time of the ancient Egyptians.

BERESFORD, JAMES, 1764–1840; an English author, educated at Oxford, and a rector in Leicestershire. His *Miseries of Human Life*, a satire in prose, is well known.

BERESFORD, WILLIAM CARR, Viscount, a distinguished military commander, natural son of the first marquis of Waterford, was born 2d Oct., 1768, and entered the army in 1785. After serving in various parts of the world, he bore a conspicuous part in the reconquest of the cape of Good Hope in 1806, and subsequently, with the rank of brig.gen., was with the British force that took possession of Buenos Ayres. In Aug., 1808, he joined the British army in Portugal, and proceeded into Spain with sir John Moore's force; was present at the battle of Corunna; and, after covering the embarkation of the troops, returned with them to England. In Feb., 1809, maj.gen. B. was ordered a second time to Portugal, to take the command of the Portuguese army, with the local rank of lieut.gen.; and he succeeded in improving its discipline so greatly, as soon to render it highly efficient for active service. Appointed marshal of Portugal in Mar., at the head of 12,000 men, he attacked the French in the north of that kingdom, crossed the river Douro, drove Loison's division back to Amarante, and uniting with the force under sir Arthur Wellesley, pursued it in its retreat till it was utterly disorganized. For his services at the battle of Busaco, 27th Aug., 1810, B. was nominated a knight of the bath. He commanded at the bloody battle of Albuera, May 16, 1811, and for the victory there gained over Soult, he received the thanks of parliament. He was present at Badajoz; at Salamanca, where he was severely wounded; at the various battles on the Pyrenees; at Nivelle, where he led the right of the center; at Nive; and at Orthez. He was in command of the British troops which took possession of Bordeaux, and subsequently distinguished himself at the battle of Toulouse. In May, 1814, he was created baron, and in 1823 viscount Beresford. By the Portuguese government, he was sent, in 1814, to Rio Janeiro, to suppress a formidable revolt there. In the Wellington administration, Jan., 1828, to Nov., 1830, he was master-gen. of the ordnance. He bore the title of marquis of Campo, mayor and duke of Elvas in Spain, conde de Francoso in Portugal, and was knight of several foreign orders. He died, without issue, 8th Jan., 1854, when the title became extinct.

BERESI'NA, or BEREZI'NA, a river of Russia, having its rise in the n. of the government of Minsk. It flows in a southward direction for about 240 m. to the Dnieper, which it joins above Redchitzka. It is connected with the Düna, or Dwina, by a canal, a communication between the Black and Baltic seas being thus established. The B. is memorable on account of the disastrous passage of the French army, Nov., 1812, during the retreat from Moscow. Two bridges over the B.—one for troops, the other for baggage and artillery—were hastily constructed. Many of the *pontoniers* died from the hardships endured in making these bridges. On the 27th, the passage of the French commenced, and was continued during the whole of the day. Victor's rear-guard of 7000 men, under Partonneaux, were, however, intercepted by the Russians, and had to capitulate. On the 28th, a vigorous attack was made by the Russians on the French on both sides of the river, but too late to prevent the latter securing the road to Zembin. The Russians, however, established a battery of 12 pieces to command the bridge; and the panic and confusion of their enemies now became dreadful. The artillery bridge broke, and all rushing to the other, it was soon choked; multitudes were forced into the stream, while the Russian cannon played on the struggling mass. On the 29th, a considerable number of sick and wounded soldiers, women, children, and sutlers, still remained behind, despite the warnings of marshal Victor and gen. Eblé, until preparations were made for burning the bridges. Then a fearful rush took place; and as the fire seized the timbers, men, women, and children threw themselves in desperation into the flames or the river. 12,000 dead bodies found on the shores of the river, when the ice thawed, attested the magnitude of the French distaster. The Russians took 16,000 prisoners and 25 pieces of cannon.

BERET TYO-UJFALU', a market-town of Hungary, co. Bihar, with a pop. '69, of 5760.

BEREZ'NA, a t. of Russia, in the government of Tchernigov, on the Desna. Pop. '67, 9678.

BEREZOV', or BERESOFF' ("the town of birch-trees"), a t. of Siberia in the government of Tobolsk, on the left bank of the Sosva, a branch of the Obi, in lat. 63° 30' north. It is a small place, but important as the sole fur and skin trading station in a vast extent of country. Its annual fair is largely attended. It is the favorite residence of the Ostiaks and Voguls. Prince Menschikoff, the favorite of Peter the Great, who was banished to B., died and was buried here in 1731. His grave was opened 90 years afterwards, when his body, clothed in the uniform of the time, was found as free from decay as on the day it was buried, the frost, which at B. penetrates the soil to the depth of several feet, having preserved it. Pop. '67, 1561.

BERG, BURG, BURGH, roots entering into the composition of many names of places. *Berg* (Ger.), *Beorg* (Ang.-Sax.), means "hill," "mountain;" and *burg*, or *burgh*, means

"fort," "castle," "citadel," probably from being situated on a hill or eminence. See BOROUGH, BURGH.

BERG, formerly a duchy of Germany, now incorporated with the Prussian dominions, and divided into the circles of Düsseldorf, Solingen, Elberfeld, Lennep, and Duisburg. After various vicissitudes, B. had merged in the electorate of Bavaria. In 1806, Bavaria ceded it to France; and Napoleon the same year adding to it large adjoining territories, made its area about 6700 sq.m., and erected it into a grand duchy, constituting his brother-in-law, Murat, sovereign. Two years afterwards, Murat, being transferred to the throne of Naples, Napoleon's nephew, then crown prince of Holland, was made grand duke. The peace of 1815 gave B. to Prussia.

BER'GA, a t. of Catalonia, Spain, situated near the river Lobregat, 52 m. n.n.w. from Barcelona. Its streets are paved, but mostly narrow and crooked. It has 5 squares, 3 churches, several convents, a hospital, schools, etc. It is overlooked and defended by a castle with a strong battery. Pop. 6333, mostly employed in husbandry and as muleteers; the produce of the fields, vineyards, and olive-yards of the neighborhood giving rise to a considerable trade. Cotton fabrics are also manufactured in B., and this branch of industry is on the increase.

BERGAMA (ancient *Pergamos*), a city of Asiatic Turkey, vilayet of Khodavendikhiar, situated in a beautiful and fertile valley, on the right bank of the Caicus, about 40 m. n.n.e. of Smyrna. Lat. 39° 4′ n., and long. 27° 12′ east. In early times, the city was the capital of the kingdom of Pergamus (q.v.). Many ruins still exist to attest the former magnificence of Bergama. The present pop. of B. is about 15,000, four fifths of whom are Turks.

BER'GAMO (the ancient *Bergomum*), a fortified t. of Lombardy, situated on some low hills between the Serio and Brembo, about 29 m. n.e. of Milan, in lat. 45° 42′ n., and 9° 37′ east. B. consists of two parts—the upper city, wherein the nobility, an exclusive class, reside; and the Borgo, a suburb where business is transacted. Pop. '72, 34,555. B. is well built, has a castle occupying the most elevated part of the town, and a cathedral. Silk, cotton, linen, woolen fabrics, and iron goods are manufactured. It has also an extensive trade in grindstones, quarried in the vicinity. Annually, in the month of Aug., the largest fair in northern Italy is held here, at which money to the estimated amount of £1,200,000 is turned over. Under the Roman empire, B. became a municipal town of importance. It was destroyed by Attila, 452 A.D.; and after the fall of the Roman empire, it became one of the chief towns of the Lombard kings in this part of Italy, and capital of a duchy. After numerous changes, its inhabitants placed themselves under the protection of the Venetian Republic in 1427, and formed an integral portion thereof (with one exception of 9 years) until the subversion of the republic by Napoleon in 1797. Bernardo Tasso, the father of Torquato, and Tiraboschi, author of *The History of Italian Literature*, were natives of Bergamo. B. is the capital of the province of the same name, which has an area of 1015 sq.m., a pop. '71, of 368,152, and good pasturage for sheep and goats; iron, marble, lignite, and whetstones are also found.

BERGAMOT is the name of various kinds of pear, to which, however, no common distinctive character can be assigned. The name is used both in Britain and upon the continent of Europe. The proper B. pear is probably the *B. crasanne*, a flattish, rough-skinned pear with a long stalk. It has a very juicy pulp, as soft as butter, of an extremely pleasant flavor, and is esteemed as one of the best dessert pears. Metzger, in his work on the pomaceous fruits (*kernobstsorten*) of the s. of Germany (Frankfort, 1847), describes no fewer than 47 kinds of pears, which all bear the name of B., although some of them differ very widely from each other.

BERGAMOT is also the name of a species or variety of the genus *citrus* (q.v.), also called the B. ORANGE, or MELAROSA; by some botanists regarded as a variety of the orange (*C. aurantium*); by others, as a variety of the lime (*C. limetta*); and elevated by Risso to the rank of a distinct species, under the name of *C. bergamia*. Of its native country or origin, nothing can be told, except that it was probably derived, like its congeners, from the east. It is now cultivated in the s. of Europe; and from the rind of its fruit, the well-known OIL OF B. is obtained, which is extensively used in making pomades, fragrant essences, eau de Cologne, liqueurs, etc. The fruit is pear-shaped, smooth, of a pale-yellow color, and has a green, subacid, firm, and fragrant pulp. The essential oil is obtained by distillation, or by grating down the rinds, and then subjecting them to pressure, which is the better method. The oil is also obtained from other varieties or species of the same genus. It is of a pale-yellow color, or almost colorless. One hundred B. oranges are said to yield about 2½ ounces of oil. Oil of B. is frequently employed for diluting or adulterating the very expensive blue volatile oil of camomile (q.v.).

BERGEDORF, a t. of Germany, 10 m. e.s.e. from Hamburg. When Lübeck joined the Zollverein in 1868, it resigned to Hamburg, on payment of 200,000 thalers, its share in the government of B., and its small territory. Pop. of territory above 12,000. Part of this territory is known by the name of the Four Lands (*Vierländer*). It is inhabited by a well-conditioned and industrious population, much occupied in the cultivation of fruit and vegetables, not only for the market of Hamburg, but for that of London.

Peach and apricot orchards, and fields of strawberries: extend over great part of the district. Cattle-husbandry is also carried on, and much attention is devoted to the rearing of poultry. The people of the Four Lands are distinguished from their neighbors by peculiarity of dress, and even each of the four small communities from which the name has been derived has some distinguishing peculiarity of its own.

BERGEN, a seaport t. of Norway, in the province of the same name, situated on a promontory at the head of a deep bay, called Vaagen. Lat. 60° 24′ n., long. 5° 18′ e. With the exception of the n.e. side, where lofty mountains inclose it, B. is surrounded by water. It is walled, and additionally protected by several forts, mounting in all upwards of 100 guns. The entrance to the harbor is dangerous without a pilot; but within, it is safe and commodious. B. is built in a semicular form round the harbor, and has a picturesque appearance from the sea. A close inspection discovers it to be generally well and substantially built, but many of the streets are crooked and narrow. It has a cathedral, various churches, hospitals, refuges for the poor, public libraries, etc.; is the seat of a secondary judicial tribunal, of one of the three national treasuries, the diocese of a bishop, and the station of a naval squadron. Its chief manufactures are tobacco, porcelain, and cordage. It has numerous distilleries, and some ship-building yards. The principal trade of B., however, is its export of stock-fish (dried fish of the cod family) and cod-liver oil, which it obtains from the northern provinces. Twice a year, the Norlandmen come to B. with their fish, receiving in exchange for them such articles of necessity or luxury as they require. In March and April, as many as 600 or 700 vessels are to be seen in the harbor of B. at once, laden with the produce of the winter-fishing, and with skins and feathers. The summer-fishing is not quite so productive. The annual value of the stock-fish exported from B. is about 2,000,000 specie dollars (£450,000). In addition, it exports about half a million barrels of herrings, and 20,000 barrels of cod-liver oil, the finest of which is used for medicinal purposes and for lamps, the coarsest for dressing leather. The chief imports are brandy, wine, corn, cotton, woolens, hemp, sugar, coffee, etc. The climate of B. is exceedingly humid, but not unhealthy. B. was founded in 1069 or 1070, by Olaf Kyrre, who made it the second city in his kingdom, and it was soon raised to the first rank. In 1135, king Magnus had his eyes put out here by his rival, Harald Gille, who was himself murdered in B. a year after. In 1164, the legate of the pope crowned king Magnus Erlingson here; and here, a century afterwards, king Hakon was crowned. The black pestilence, which ravaged Norway, first made its appearance in B. in 1348, and the city has since been several times devastated by it. The first treaty entered into with any foreign nation by England was made with B. in 1217. But the English and Scottish traders were soon displaced by the merchants of the Hanse towns, who continued to exercise and abuse their monopoly until their supremacy was broken by an act issued by Frederick II. of Denmark, in 1560; and in 1763, their last warehouse fell into the hands of a citizen of Bergen. B. was long the most important trading town of Norway, but has been recently surpassed by Christiania. Pop. '75, 34,384.

BERGEN, a co. in New Jersey on the Hudson river; intersected by the Erie, New York and Oswego Midland, and Northern New Jersey railroads; 350 sq m.; pop. '80, 36,790. The chief geological feature is the Palisades, a perpendicular wall of rock forming the w. bank of the Hudson through the entire county, rising from 300 to 500 ft. above the water. The county is intersected by the Hackensack, Ramapo, and Saddle rivers. Market gardening for New York is a leading industry. Co. seat, Hackensack. Among its population are many descendants of the early Dutch settlers.

BERGEN, a province in s.w. Norway, on the Atlantic; area, including a part of Romsdal, 18,549 sq.m.; pop. '75, 356,561. The coast is indented by many fjords or gulfs, the largest being Hardangar Fjord. There are high mountains all over the province, but in the valleys around the fjords and streams, good pasturage is found. Cattle breeding and the herring fisheries are the main occupations. There are marble, and ores of copper and iron, but none are worked owing to want of fuel. Capital, Bergen.

BERGEN-OP-ZOOM, a t., formerly strongly fortified, in the province of North Brabant, Netherlands, about 20 m. n. of Antwerp, stands on the little river Zoom, at its entrance into the e. branch of the Scheldt. Lat. 51° 29′ n., long. 4° 17′ east. The importance of its position rendered it the object of many a contest. The Netherlanders made it one of their strongholds in their struggles with Spain. The prince of Parma besieged it in vain in 1588; three assaults by the Spaniards in 1605 also failed, as did the siege by the marquis of Spinola, in 1622, which, after a duration of 78 days and a loss of 10,000 men, was raised on the arrival of prince Maurice of Orange. The fortifications were afterwards strengthened by the engineer Cochorn, so as to give it the reputation of being impregnable. Yet the French, under count Löwendal, in 1747, after a siege of two months, and the springing of 41 mines by the assailants, and 38 by the defenders, took the place by storm. In the winter of 1794, it capitulated to Pichegru. Being incorporated with France in 1810, it was blockaded by the English in 1814, who, under sir Thomas Graham, attempted to surprise the fortress on the night of the 8th of Mar., with a force of 4000, but after carrying the greater part of the works, they were, through remissness in sending support, overpowered by the brave garrison, and either slain or

forced to surrender. The French gave up the fortress under the treaty of Paris. B. has manufactures of earthenwares, and a large trade in anchovies. Pop. '75, 9599.

BERGERAC, a t. of France, in the department of Dordogne, about 25 m. s.s.w. of Périgueux. It is situated in a fertile plain on the right bank of the river Dordogne, which is here crossed by a fine bridge of five arches. Its principal manufactures are paper, serges, hosiery, hats, earthenware, and iron and copper articles. It is the entrepôt of the trade of the department. The department of Dordogne is celebrated for its wine, which is called B. wine, and also *small champagne*. It is both white and red in color, and takes a high place among the Garonne and Bordeaux wines. B. was taken and fortified by the English in 1345, who, after being driven out by Louis of Anjou, again got possession of it, and retained it until 1450. B. suffered greatly in the religious wars. It was dismantled by Louis XIII. in 1621. Pop. '76, 10,610.

BERGH, HENRY, b. N. Y., 1823; educated at Columbia college, and author of several works of fiction, among them a drama called *Love's Attractions*, *Married Off*, *The Ocean Paragon*, *The Streets of New York*, etc. He was secretary of legation at St. Petersburg in 1863, and subsequently vice-consul. Nearly 20 years ago he became interested in the treatment of domestic animals, and in face of much opposition he succeeded, in 1866, in getting an incorporation of the "American Society for the Prevention of Cruelty to Animals." The work of the society commended itself to the better class of the people, and its growth was rapid and substantial. The report for the first year showed 101 prosecutions; 41 for beating horses or other animals with clubs, whips, etc.; 10 for conveying animals in a cruel and inhuman manner; 15 for driving horses unfit to be used; 3 for overloading; 12 for starving or abandoning horses or other animals; and 20 for various acts of cruelty to cattle, dogs, cats, poultry, etc. In the thirteen years ending with 1878, there were 6809 prosecutions, including, besides the offenses named, driving horses until they fell dead, dragging horses with broken legs through the streets, selling diseased animals, plucking poultry while alive, dog and cock fighting, using instruments of torture, malicious mutilating, wounding, or poisoning of animals, etc. When the society began operations, the common method of transporting sheep and calves was by tying their legs and piling them one on another in a truck, the driver not seldom seating himself comfortably upon the agonizing heap, and taking his ease, while they bleated and groaned beneath him. Now such animals are carried standing in large cages. The main room of the society contains a curious collection of the bits, spurs, gags, fetters, goads, and other instruments of torture heretofore used, fit to be shown with similar engines employed in the palmy days of the Spanish inquisition upon men and women who failed to believe in the dogmas held by their tormentors. Since the organization of Mr. B.'s society, 13 branches have been started in the state of New York. In the other states of the union and in Canada, there are now 62 societies devoted to the same object; and England and other foreign countries have followed the example. In Nov., 1878, the "International Society of America" held its first session to consider the question of the transportation of cattle. It must be added that the humane work begun by Mr. B. soon enlisted the sympathies of women, and some of his ablest assistants and most generous donors are found among the estimable ladies in New York and elsewhere. The present society has for six years published a journal to advocate its purposes, and its drinking hydrants for man and beast in various parts of the city and the parks keep it in constant memory.

BERGHAUS, HEINRICH, one of the most active promoters of geographical knowledge, was b. at Cleves, in Rhenish Prussia, 3d May, 1797, and educated at the gymnasium of Münster. As conductor of the road and bridge corps in the department of the Lippe, then (1811) part of the French empire, and afterwards in the Prussian army, he had opportunity to advance his knowledge of geodesy. In 1816, he was made "geographical engineer" in the war department in Berlin, and was employed on the trigonometrical survey of Prussia, and became (1824) professor of mathematics in the architectural academy of Berlin (a post he held till 1855), and (1836) director of the geographical school in Potsdam. The best known of his chartographical works is his *Physical Atlas* (90 plates, Gotha, 1838–48), which forms the basis of Johnston's work with the same title published in Edinburgh. He has been employed on an ethnographical map of Germany since 1848. As a writer, he has edited several geographical periodicals. His *Geog. Jahrbuch* (Geog. Annual), published since 1849, forms a supplement to the *Physical Atlas*. Of a more popular nature are his *Physicalische Erdbeschreibung* (Physical Descriptions of the Earth), *Grundlinien der Staatenkunde* (Outlines of the Political Character of States), and *Ethnographie*, all of which appeared at Stuttgard between the years 1846–50. In 1855, he published a work entitled *Was man von der Erde weiss* (What is known of Earth). In 1855–56, appeared an *Atlas der Oesterreichischen Monarchie*, and *Landbuch der Mark Braadenburg*. In 1862 appeared his *Landbuch von Pommern;* and in 1863, *Briefwechsel Alexander von Humboldt's mit H. Berghaus*.

BERGHEM, NICHOLAS, one of the finest of the Dutch painters, was b. at Haarlem, 1624, and studied painting first under his father, afterwards under Van Goyen, Weenix the elder, and other masters. He soon acquired an extraordinary facility of execution; and his industry, naturally great, was stimulated by the cravings of his avaricious wife, who thought he could never earn too much. Accordingly, he scarcely ever left his

studio, and we might wonder where he found all the materials for his landscapes, which now decorate the best collections of Europe; but he had carefully studied nature during his long residence at the castle of Bentheim. Warm coloring, natural and original grouping, and a general happy arrangement, are the leading features in B.'s landscapes. Strict criticism may object to some traces of lightness in execution, and may demand greater natural truth in some points, especially the outlines of animals; but these defects are lost in the general excellence of B.'s pictures. His etchings are highly esteemed. B. died in his native place, 1683.

BERGLER, JOSEPH, a historical painter of considerable note, was b. at Salzburg, 1753. Having studied under Martin Knoller at Milan for several years, B. went to Parma, where, in 1784, his picture of Samson being delivered by Delilah into the hands of the Philistines obtained the chief prize of the academy there. Returning to Germany, he, in 1786, settled at Passau, where he was appointed painter to cardinal Auersperg, prince-bishop, and in this capacity painted many fine altar-pieces. B. having been made director of the academy of Prague in 1800, removed to that city, where he continued to reside until his death in 1829. The impetus which he gave to the fine arts in Bohemia was very marked, and his school furnished a goodly number of eminent artists. His principal works are a *Cyclus*, or series of important events drawn from the history of Bohemia, in 66 sheets: "Libissa, Queen of the Fairies, deciding a Dispute between two Brothers for the Heritage of their Father;" "The Deliverance of Charles IV.;" and "Hermann and Thusnelda."

BERGMAN, TORBERN OLOF, a celebrated chemist of the 18th c., was b. at Katharinberg, West Gothland, Sweden, Mar. 9, 1735. He was sent at 17 years of age to the university of Upsala, with a view to prosecute studies qualifying him either for the church or the bar; but disliking both these professions, he devoted himself to natural history, physics, and mathematics, and soon made some interesting discoveries in entomology, while he also distinguished himself as an accurate astronomical observer. In 1767, B. was elected to the chair of chemistry at Upsala, and continued to fill it until his death, which took place at Medevi, in July, 1784. B. published a vast number of dissertations, the most important of which are collected into six octavo volumes under the title of *Opuscula Torberni Bergman Physica et Chemica* (Leip. 1779–81). His essay on *Elective Attractions* was translated into English by Dr. Beddoes.

BERG'MEHL, or MOUNTAIN-FLOUR, is a recent deposit of a white or cream-colored powder of extreme fineness, composed almost entirely of the indestructible silicious frustules or cell-walls of *diatomaceæ* (q.v.). From its resemblance to flour, it has been mixed with ordinary food, in seasons of scarcity, and thus used by the inhabitants of Norway and Sweden, who suppose it to be nutritious. When subjected to a red heat, it loses from a quarter to a third of its weight, the loss consisting probably of organic matter, and this would make it in itself nutritious; but it seems to derive its chief value from its increasing the bulk of the food, and rendering the really nutritious portion more satisfying. On the other hand, there have been experiments tending to show that B. does contain a very small proportion—3 or 4 per cent—of positive nutriment.

Similar deposits occur at Dolgelly in North Wales, at South Mourne in Ireland, and in Mull and Raasay in the Hebrides. The contained organisms show that these beds have been deposited in fresh water.

BERGUES, a t. of France, in the department of the Nord, about 5 m. s.s.e. from Dunkirk. It is situated on the Colme, at the foot of a hill, was strongly fortified by Bauban, and has the means of laying the valley under water. The canal of B., which admits vessels of 300 tons burden, unites it with Dunkirk and the sea, and its favorable situation makes it the entrepôt of the produce of the adjoining country. It has manufactures of soap, tobacco, and earthenware, and also sugar and salt refineries. B. was first walled and fortified by Baldwin II.; count of Flanders; and Baldwin IV. erected a splendid abbey, of which two towers only remain, in honor of St. Winnoc, who retired here in the beginning of the 10th century. Between the 13th and 16th centuries, B. suffered much from wars, and changed masters several times. Pop. '76, 5368.

BERGYLT, *Sebastes Norvegicus* or *Scorpæna Norvegica*, a fish of the mailed cheeks (q.v.) family, or *sclerogenidæ*—the family to which gurnards and sticklebacks belong—but so much resembling a perch in appearance, that it was formerly called *perca marina*, or sea-perch. It is sometimes called the Norway haddock, although it has no resemblance to the haddock. It is an inhabitant of all the northern seas, and is occasionally found on the British coasts at least as far s. as Berwick. It is of a red color, dark on the upper parts, reddish-white beneath. Its gill-covers are armed with short spines; the anterior rays of the dorsal fin are strong spines, the posterior portion of the fin has soft rays. The B. attains a length of two ft. or upwards. It is good for food, and the Greenlanders use it not only in a fresh but in a dried state. They take it by long lines and baited hooks in the deep bays of their coast.

BERHAMPORE', the name of two towns in British India.—1. B., in the presidency of Madras, is a military station in the district of Ganjam. It is in n. lat. 19° 20', and e. long. 84° 50', being 525 m. to the n.e. of Madras, and 325 to the s.w. of Calcutta. The cantonments, themselves on a rocky ledge, have to the s. and e. a plain of consid-

erable extent, on the nearer edge of which is the native town, with a pop. of (1871) 21,670.—2. B. or Burhampore, in the presidency of Bengal, is in the district of Moorshedabad, being on the left bank of the Bhagirathi or Bhagruttee, which, itself the first great offset of the Ganges, afterwards joins another great offset, the Jellinghee, to form the Hoogly. B. is in n. lat. 24° 5′, and e. long. 88° 17′, being distant from Calcutta by land and water respectively 118 and 161 miles. It has long been one of the principal military stations in British India. The grand square, inclosing a spacious parade-ground, is particularly striking; and the quarters of the European officers form handsome ranges of brick-built and stuccoed edifices. There are here a college, hospitals, and mission churches. B. is the seat also of a civil establishment; and the houses of its chief members, erected in convenient spots in the neighborhood, give the place an air or grandeur and importance. B., though at one time extremely unhealthy, from its low and moist site on the delta of the Ganges, has yet been so much improved by sanitary measures, as to be second to no spot of Bengal in salubrity. In the spring of 1857 B. acquired an unenviable celebrity as being the cradle of the disaffection which so speedily led to the massacre of Meerut. Pop. '71, 27,110.

BE'RI, a t. of India, in the British district of Rohtuck, Punjab, in n. lat. 28° 40′, e. long. 76° 40′, 36 m. w. by n. from Delhi. Pop. '68, 9,723.

BERIOT, CHARLES AUGUSTE DE, 1802–70; a composer and violinist, b. in Louvain. He was a precocious and original musician, remarkable for pure tone and refined taste. In 1835, he became the husband of the famous singer, Malibran. In 1842, he was made professor in the Brussels conservatoire, but resigned ten years after in consequence of failing eyesight. He was the author of a complete manual for the violin, and of a great number of popular compositions for that instrument.

BERJA, a t. of Spain, in the province of Andalusia, at the foot of the Sierra de Gador, about 22 m. w. of Almeira. It has manufactures of linen fabrics, hats, hardware, and leather, and a trade in wine and oil. Pop. about 8000, who are chiefly engaged in mining lead, which is plentiful in the Sierra de Gador. Agriculture is also prosecuted to some extent.

BERKELEY, a co. in n.e. West Virginia, between two branches of the Potomac, intersected by the Baltimore and Ohio railroad; 250 sq.m.; pop. '70, 14,900—1672 colored; in '80, 17,412. The surface is rough and not easily cultivated, but much grain, butter, and wool are produced. Co. seat, Martinsburg.

BER'KELEY, a small t. of Gloucestershire, 15 m. s.w. of the t. of Gloucester, on on the small river Avon, a mile and a half e. of its junction with the estuary of the Severn. Pop. of borough (1871), 1161; of parish 5690. The town lies in the fine vale of B., which is 25 m. long and 4 broad, between the Severn on the w., and beech-covered hills on the east. This vale consists of rich meadow pasture-land, on a deep, fat loam, and is celebrated for its dairies and cheese. The latter is the far-famed "double Gloucester," of which each cow yields 340 lbs. a year. Near B. is the entrance to the B. and Gloucester canal, navigable for vessels of 600 tons. Some trade exists in timber and malt. B. castle is an embattled building on an eminence s.e. of the town, and which, about 1150, was granted by Henry II. to Robert Fitzhardinge, with power to enlarge and strengthen it. Here Edward II. was murdered in 1327 by Maltravers and Gourney. In the civil wars of Charles I., the castle held out for the king, but was taken after a nine days' siege by the parliamentarians. In the castle is preserved the cabin-furniture of Drake the navigator. Dr. Jenner, the discoverer of vaccination, was a native of B., and is buried in the parish church of St. Mary here.

BERKELEY, GEORGE, bishop of Cloyne, and a distinguished philosopher, was the eldest son of William B., a cadet of the family of the earl of Berkeley. He was born on the 12th of Mar., 1684, at Kilcrin, near Thomastown, co. of Kilkenny, Ireland. As a boy, he studied at the school of Kilcrin, at which Swift also received his early education; and in his fifteenth year he followed his great countryman to Trinity college, Dublin, where, in 1707, he obtained a fellowship. At Trinity, he enjoyed the society of Swift, who patronized him, as he did almost everybody, and who subsequently had a great deal to do in shaping his fortunes.

B.'s career as an author began in 1707 (the year in which he obtained his fellowship) by the publication of a work written three years before, at the age of 20, entitled *Arithmetica absque Algebrâ aut Euclide Demonstrata*. This was followed, in 1709, by the celebrated essay, *Towards a New Theory of Vision*, in which he demonstrated the dependence of the perceptions of distance, magnitude, and situation on the sense of touch. This essay led to considerable controversy at the time, though its conclusions may now be considered as not admitting of doubt. In 1733, B. produced a pamphlet in vindication of it—viz., *The Theory of Vision or Visual Language, showing the Universal Presence and Providence of the Deity Vindicated and Explained*. By this time he had propounded his system of absolute idealism. His *Treatise concerning the Principles of Human Knowledge* appeared so early as 1710. Its object was to undermine the materialism of the age, by denying, on received principles of philosophy, the reality of an external world. If there is no external world, he argued, the phenomena of sense can be explained only by

supposing a deity continually necessitating perception. B. has since been laughed at by many who could not see how the premises laid in the philosophy of the day led to his system; by many he will always be laughed at as an idle dreamer; but, in point of fact, his system is a monument at once of marvelous subtlety of mind and of the most pious devotion of the intellectual powers to the cause of religion. The object was, as the full title of the book itself sets forth, to inquire into and remove the causes of scepticism, atheism, and irreligion. It is only an illustration of the truth of the old saying, that extremes meet, if, in following out this pious purpose, he prepared the way for a subtler form of scepticism (in Hume's philosophy) than the world had previously known. The reader will find valuable assistance to the apprehension of B.'s system in sir William Hamilton's *Discussions*, and in his dissertations and notes to Reid's *Philosophy of the Human Mind*. It must suffice to mention here that B. was the first philosopher who proposed a scheme of absolute idealism.

In 1713, B. went to reside in London, where, in the same year, he published a defense of his ideal system, *Three Dialogues between Hylas and Philonous*. Shortly after this he was appointed chaplain and secretary of legation under lord Peterborough, whom he accompanied to Italy. In 1721, he returned to London; and in 1724, he became dean of Derry, with an income of £1100, and resigned his fellowship.

B. was not a man to settle in the enjoyment of leisure and opulence. The dean of Derry set to devising schemes of usefulness, fixing at last on one by which his deanery and income were to be exchanged for exile and £100 a year. This was the Bermudas college scheme for training pastors for the colonies, and missionaries to the American Indians. Swift, failing to induce him to give the project up, made influence with ministers to support it, which they promised to do. Full of hope, B. prepared for his exile; he married in Aug., 1728, Anna Elvert, daughter of right hon. John Forster, speaker of the Irish house of commons, and soon after sailed for Rhode Island. The support promised by government was never given to him, and, after six years, he returned to England heart-broken with failure, and harassed by creditors. He had barely returned, however, when (1734) he received the bishopric of Cloyne, as a mark of favor from the queen. He was now once more in the enjoyment of leisure for literature. Soon appeared the *Minute Philosopher*, followed by various letters and pamphlets on the state of the country, and, in 1749, by *A Word to the Wise*. In 1744, he gave the world his notions of the virtues of tar-water in a book entitled *Siris*. Tar-water appears to have been in his thoughts as in his system—which must have been saturated with it—from this time till his death. His last work was *Farther Thoughts on Tar-water*, published in 1752. The fact is, he was hypochondriacal for many years before his death. He died, 14th Jan., 1753, at Oxford, whither he had gone to live with his son, who was studying at Christ church. A genial companion, an affectionate and steady friend, he was loved by all of his contemporaries who enjoyed his society; a graceful writer, a subtle philosopher, and an active churchman, his whole life was devoted to usefulness, and ennobled by the purity of his aspirations. The best edition of his works is that of prof. Fraser, LL.D., 1871.

BERKELEY, MILES JOSEPH, an English botanist, b. 1803; educated at Cambridge, a curate at Margate, and dean of Weldon. He is a fellow of the Linnæan and many other scientific societies; author of *Gleanings of British Algæ*, of the concluding volume of *English Flora*, articles on *Diseases of Plants*, papers on vegetable pathology, an introduction to *Cryptogamic Botany*, and works on fungi, mosses, etc.

BERKELEY, Sir WILLIAM, d. 1677; Governor of the colony of Virginia in 1641, keeping the colony loyal to the king until compelled by his friends to submit to Cromwell. 1651, when Richard Bennet was made governor. B. remained in the colony, and in 1660 was chosen governor by the general assembly. Years later he lost the favor of the people by failing to protect them from the Indians, and a rebellion against him led by Nathaniel Bacon (q.v.) almost succeeded, but failed in consequence of the sudden death of the leader. He was recalled in 1677. B. was the author of *A Discourse and View of Virginia* and a drama called *The Lost Lady*.

BERKELEY SOUND, the most frequented inlet of the East Falkland island, near its n.e. extremity. It is in lat. 51° 30′ s., and long. 57° 56′ west. Though it is difficult to enter, yet it contains several excellent harbors. Its shores yield ample supplies of water, cattle, and vegetables.

BERKELEY SPRINGS, or BATH, a t. and seat of justice of Morgan co., W. Va., near the Potomac, 77 m. w. of Washington; pop. 70,407. Persons suffering from dyspepsia, neuralgia, and chronic rheumatism, are benefited by the water.

BERKHAM'STEAD, GREAT, or BERKHAMSTEAD ST. PETER'S, a market t. of Hertfordshire, England, situated in a deep valley, on the right bank of the small river Bulborn, on the Grand Junction canal and the London and North-western railway, 28 m. n.w. from London. The main street is about 1 m. in length. The town is well built, mostly of brick. The parish church, a cruciform building in the center of the town, is chiefly in the perpendicular style. The father of the poet Cowper was rector of B., and the poet himself was born here. The town is supposed to be of Saxon origin, and the kings of Mercia had a palace or castle here. William the conqueror met the nobles and prelates at B., and took an oath to rule according to the ancient laws and customs of the

country. He bestowed the castle and manor of B. on his half-brother, the earl of Moreton. The castle was rebuilt in the reign of king John. The property having reverted to the crown, was bestowed by Edward III. on his son, the Black Prince, when he created him duke of Cornwall, and has since been held by the princes of Wales as dukes of Cornwall. A few massive fragments of the wall of the castle still remain, to the e. of the town. A free grammar-school was founded in the reign of Edward III., and still subsists, having been lately much enlarged and enriched by the establishment of several exhibitions. A charity-school was founded under the will of Thomas Bourne in 1727. Straw-plaiting is carried on to a considerable extent in B., and a vast number of wooden articles are made, as bowls, cricket-bats, hoops, toys, etc. There are extensive chemical works, and a considerable trade in timber, malt, and coals. There is a weekly corn-market. Pop. '71, 4083.

BERKS, a co. in s.e. Pennsylvania, on the Schuylkill, intersected by the Philadelphia and Reading, and Wilmington and Reading railroads; 920 sq.m.; pop. '70, 106,701. The Blue mountains are on the n.w., and the South mountain, or the Blue Ridge, traverses the central s.e. portion. The valley soil is fertile and well cultivated, and there are iron and copper mines of value. B. was settled by Germans more than a century ago, and its people still speak "Pennsylvania Dutch," together with English. Co. seat, Reading.

BERKSHIRE, a co. in Massachusetts, forming the entire w. border of the state; crossed by the Boston and Albany, the Pittsfield and North Adams, and the Housatonic railroads; 1000 sq.m.; pop. '78, 68,270. The surface is greatly diversified by mountains, forests, and streams. Saddle mountain is the highest point in the state. Grazing is a leading feature. Marble, limestone, and iron are found, and there are many manufactories of wool, cotton, leather, flour, paper, lumber, etc. The picturesque scenery has attracted from the large cities many residents, who have embellished the region with elegant rural homes. Co. seat, Pittsfield.

BERKSHIRE, a midland co. of England, bounded n. by Gloucester, Oxford, and Bucks, e. by Oxford and Bucks; s.e. by Surrey; s. by Hampshire, and w. by Wiltshire. Greatest length, 50 m.; average breadth, 15. Area, 752 sq.m., nearly one half of which is under tillage, one fourth in pasture, and one sixteenth in wood. B., which is one of the most beautiful of the English counties, lies in the valley of the Thames, and has an undulating surface, rising in some parts into hills. Older tertiary strata, consisting of the London clay, occupy the e. part of the county; cretaceous strata, the middle; and oolitic, the west. A range of chalk-hills, or downs, connected with the Chilterns on the e., and the Marlborough Downs on the w., crosses the country into Wiltshire, from Reading to Wallingford, attaining at White Horse Hill (so called from the gigantic figure of a horse rudely defined in the chalk—a relic of ancient times) a height of 893 feet. Between this range—the w. part of which is occupied by sheep-walks—and a smaller oolitic one skirting the valley of the Thames, is the vale of White Horse, the richest part of the county, and drained by the Ock. To the s. of the Downs is the fertile vale of Kennet, drained by the river of that name, and its feeder, the Lambourn. To the e. is the forest district, comprising Windsor forest, part of Bagshot Heath, etc. The forest chiefly consists of hazel, oak, beech, ash, and alder. The Thames skirts the whole n. border of the county, winding through a course of 100 m., but in a direct line, only 52, and navigable nearly the whole way. It is the chief river of B., the other rivers of the county being its tributaries; of which the chief are the Kennet, Leddon, and Ock. The Kennet is navigable for 30 miles. The climate of B. is very healthy, being mild in the valleys, and bracing on the high lands. The soil varies greatly: in the valleys, it is generally a fertile loam, with a subsoil of chalk, gravel, or clay. The country between the valleys of Kennet and White Horse consists chiefly of sheep-walks; and along the Thames, and to the w. of the Ridge Way, or Downs, it is chiefly dairy and pasture land. The chief crops are oats and wheat. "Double Gloucester" and "pineapple" cheese are exported in large quantities to London. There is a superabundance of horses. Swine are extensively reared, especially near Faringdon, the breed being one of the best in England. Property is very much divided, and the number of gentlemen's seats and villas is very great. The farms are generally of moderate size. The county is traversed by the Great Western railway and its branch lines, and by two canals. B. is divided into 20 hundreds, 151 parishes, and 12 poor-law unions. It returns 8 members to parliament, 3 for the county, 2 for Reading (the county town), and 1 each for Windsor, Wallingford, and Abingdon. Besides these towns, there are the municipal boroughs of Newbury (the scene of two severe conflicts in the civil war) and Maidenhead, and the market-towns of Faringdon, Hungerford, Wantage, Wokingham, East Ilsley, and Lambourn. The pop. of B. in 1871 was 196,475 (97,078 males and 99,397 females), showing an increase of 20,219 since 1861, when the pop. was 176,256, and of 85,995 or 78 per cent since the first census in 1801. The county has no manufactures of any importance. The British and Roman remains are numerous, including Roman roads and many camps and barrows. Of the old castles, the principal relic is Windsor (q.v.); of monastic establishments, the abbeys of Abingdon and Reading. The churches are small, and, from the scarcity of building-stone, are often constructed of chalk and flint. There are many Norman churches, erected in the 12th and 13th centuries.

BERLEBURG, or BERLEBURGER, BIBLE, published by unknown editors at Berleburg, in Germany, 1726–29. It is an original translation, with a running exposition, giving the literal, spiritual, and hidden or mystical interpretation. It has the characteristic excellences and defects of pietism.

BERLEN'GAS, a group of rocky islands in the Atlantic ocean, off the w. coast of the Portuguese province of Estremadura, and 10 m. n.w. of Peniche. The principal one, named Berlenga, is fortified, and has been used as a state-prison.

BERLICHINGEN, GOETZ or GOTTFRIED VON, "of the iron hand," a German knight of the 16th c., may, with Ulrich von Hutten, be considered as the last worthy representative of the chivalry of the middle ages, then expiring. He was b. at Jaxthausen, in Würtemberg, in the ancestral castle of his family, which may be traced back into the 10th century. His education was conducted by his uncle Kuno, with whom he attended the diet of Worms in 1495. He gratified his passion for war at first by taking part in several of the quarrels between German princes, and at the siege of Landshut lost his right hand, which was replaced by one of iron, yet shown at Juxthausen. When the general peace of the country had been established under Maximilian I., Goetz retired to his castle. But a restless spirit, and the general turbulence of the time, involved him in continual feuds with the neighboring barons and free cities, in which he displayed a mixture of lawless daring and chivalrous magnanimity. Having joined duke Ulrich of Würtemberg against the Swabian league, on the duke's expulsion, he was taken prisoner, and had to pay a ransom of 2000 florins. In the peasants' war of 1525, he took part with the insurgents, and was chosen leader of a part of their forces. In his narrative, he ascribes this step to compulsion; more likely it was his own restless and turbulent spirit, and a desire for revenge on his old enemies of the Swabian league. On the unfortunate issue of the war, he at first made his escape, but was afterwards fallen upon unawares by a band of leaguers, who extorted an oath that he would appear before the league when summoned. Accordingly, he had to appear at Augsburg, where he was kept in arrest for several years, and at last sentenced to perpetual imprisonment in his own castle, and, in case of his breaking this condition, to a fine of 20,000 florins. He passed eleven years in this state, and was only pardoned on the dissolution of the league. He died July 23, 1562, after having still taken part in campaigns in Hungary and in France. He wrote an account of his own life, published by Pistorius (Nürn. 1731; Bresl. 1813), which furnishes an excellent picture of the social life and manners of the period, and on which Goethe grounded his drama of *Goetz von B.*, translated by sir Walter Scott.

BERLIN', the capital of Prussia, and seat of the imperial government of Germany, one of the finest and most important cities of Europe, is situated on the Spree, in lat. 52° 30′ n., long. 13° 24′ east. The city is built upon a flat sandy plain, which, though cultivated, is far from being fertile. The Spree, at this place about 200 ft. wide, with a current so sluggish as scarcely to be perceptible, divides the city into two nearly equal parts, and communicates with the Oder and the Baltic by canals. A more unlikely site, in some respects, could hardly have been selected for a city, as, from its flatness, and the sandy character of the soil, much inconvenience results to the inhabitants: in summer, the heat reflected from the sand is very intense, and clouds of dust rise continually; while in winter, the cold is equally great. There being little or no declivity, water stagnates in the streets, producing effects which can easily be imagined. In the Friedrich's-strasse, about 2 m. long, there is not a foot of descent from one end to the other. Notwithstanding these natural disadvantages, however, the advance of the city, especially in late years, has been extraordinary. In 1861, the city covered an area of 14,000 acres, and in 1871 of 24,000 acres. In 1858, the pop. was 455,000; in 1871, it was 825,389 (including 21,000 soldiers); in 1875, 966,872. Although, as far back as the 13th c., the central part of the present city was inhabited, B. was long little more than a fishing-village; it was not till the great elector, Frederick William (1640–88), had united the separate duchies of which Prussia is now formed, that B. became of consequence as the most central town, and the capital of a large state. His successor, Frederick I., the first king of Prussia, followed the footsteps of his predecessor in enlarging and beautifying the capital; and at the close of his reign, in the end of the 17th c., the pop. numbered about 50,000. In the next century, it received accessions of French and Bohemian colonists, driven into exile by religious persecution. Every inducement was then held out to bring foreigners to settle in the rising city. Under Frederick the great, B. continued to prosper. At his death, the inhabitants numbered 145,000. After the peace of 1815, B. increased with extraordinary rapidity, and, being the seat of government, a focus of the arts and sciences, and a great center of commercial enterprise, it has gradually risen to a position which fairly entitles it to its present rank as the metropolis of the German empire.

The center of the city is now devoted almost exclusively to commerce, and round this part, extending considerably beyond the city boundaries, are congregated the residences of the citizens. Small towns and villages are gradually being incorporated with the great city; Moabit has already disappeared as a separate community, and Charlottenburg, a town of 18,000 inhabitants, is likely soon to follow. B. consists of ten different quarters and six suburbs, containing about 480 streets, 58 squares, 700 public buildings (including 60 churches), and 15,000 private

houses (comprising 169,000 dwellings or suites of apartments). The houses are built of brick, plastered or stuccoed outside, and they soon acquire a faded appearance. The style of these has very much altered since 1864. Prior to that, the greater portion of the houses were of one, two, or three stories, but these are fast giving way to houses of four, five, and more stories, the larger ones predominating. The increase in the value of house-property has been enormous, and the result is that great numbers of the people are driven to take up their abode in cellars under-ground. About one tenth of the pop. live in these cellars, huddled together in a manner that proves deleterious alike to their moral and their physical well-being. B. possesses a large number of very fine buildings. Of these may be mentioned the royal palace, the emperor's palace, and that of the crown prince; the royal library, which contains upwards of 700,000 volumes and 15,000 MSS.; the museums, the arsenal, and the guard-house. Most of those named are situated in the street "Unter den Linden" (so called from its double avenue of limes), one of the finest and most spacious streets in Europe. The city is further adorned throughout with numerous statues of military heroes, the equestrian statue of Frederick the great, by Rauch, being the most remarkable. In regard to educational institutions, B. occupies a high position; in 1873, there were ten gymnasia, with 5333 scholars, 54 arts and higher schools, 91 public and 96 private middle and elementary schools, making in all 251 schools in the city. In addition to these, there were in the same year 59 kindergarten (infant-schools). The university, established in 1810, possesses a very high reputation. Among the professors whose talents have rendered it famous are to be found such names as those of Fichte, Hegel, and Schelling. The number of students attending the university averages about 2000. Among the numerous institutions of B. may be mentioned the academy of sciences, by far the most important of the kind in Germany; the academy of architecture; the naval and engineering colleges; several seminaries for teachers and missionaries; asylums for the deaf, dumb, and blind; besides many learned societies. In 1870, there were 18 theaters in Berlin. About 90 per cent of the pop. are Protestants, 6 per cent Roman Catholics, and 4 per cent Jews. Church-going, however, seems to be very much neglected: of the total number of Protestants, fewer than 2 per cent, on an average, attend divine worship on Sundays!

The old museum contains antiquarian specimens, collections of coins, the gallery of ancient sculpture, the picture gallery, with about 1500 paintings. The new museum contains a very extensive and valuable collection of casts arranged in 12 saloons; the Egyptian museum, a fine collection of engravings numbering upwards of 500,000, etc. Outside the celebrated Brandenburg gate (erected in imitation of the propylæa at Athens, 70 ft. high, and 200 ft. wide) extends the Thiergarten, the largest and most important park near the town. To the s.w. of this lies the zoological garden, which has recently been considerably extended. Other places of interest worthy of mention are the aquarium, the new synagogue, the exchange, the opera-house, the royal château of Monbijou, the warrior's monument, and the monument of victory, 190 ft. high, recently erected in commemoration of the great victories of 1870–71, etc.

The commerce and manufactures of B. have increased so rapidly of late years, that it now ranks among the most important mercantile places of continental Europe. The staple commodities are grain, spirits, and wool. The principal branches of industry are engine-building, which gives employment to 14,700 workers iron-casting, and the manufacture of woolen and silk goods, and fancy articles; calico-printing is also largely engaged in. In respect of its publishing trade, B. now holds the second rank amongst German cities. In 1875, there appeared 353 journals, of which 33 were daily papers.

BERLIN, a city in Green Lake co., Wis., 94 m. w. of Milwaukee, on Fox river, reached by a branch of the Chicago, Milwaukee and St. Paul railroad; pop. 3341; in '80, 3375. It has several manufactories, and steam communication with Green bay, through lake Winnebago, and the lower Fox river.

BERLIN DECREES. See CONTINENTAL SYSTEM.

BERLINGHIE'RI, ANDREA VACCA, 1772–1826; an Italian surgeon, the head of a school of clinical surgery in the university of Pisa, who constructed instruments for operations in cystotomy, fistula, fracture of the femur, etc.; he improved other instruments, and wrote on professional subjects.

BERLIN SPIRIT, a coarse whisky made chiefly from beet-root, potatoes, etc. See DISTILLATION.

BERLIOZ, HECTOR, a fertile musical composer, was b. Dec. 11, 1803, at La-Côte-St.-André, in the department of Isère, France, where his father was a physician. Against his father's wishes, who intended him to follow the medical profession, he devoted himself to music, and proceeding to Paris, studied at the conservatoire de musique under Lesueur and Reicha. In 1828, the second prize at the conservatoire was awarded to him; and in 1830, his cantata of *Sardanapalus* won the first. He now went to Italy, where he resided about two years; and on his return, published several compositions, the merits of which were much canvassed. His works are too numerous for specification; but among the most successful are the symphonies of *Harold, Romeo et Juliette,* and the *Symphonie Funèbre et Triomphale,* the requiem for the funeral of gen. Damrémont, 1837; the overture to *Carnaval Romain,* and the *Hymne à la France,* per-

formed Aug. 1, 1844, by an orchestra of almost a thousand musicians. B. afterwards conducted many concerts in Russia, Germany, and England. In 1839, he was made a chevalier of the legion of honor; and in 1856, was elected a member of the institute at Paris. He was also librarian to the conservatoire. The peculiarity of the compositions of B. consists in their endeavor to make instrumental music the exponent of particular feelings as well as general emotions. Some critics are of opinion that this notion has led the composer into extravagance and incoherence; while others speak in high terms of the freshness and individuality which characterize his style, and look upon him as the chief of the romantic school of music. B. died 9th Mar., 1869.

BERM, in fortification, is a ledge or pathway, from 3 to 8 ft. in width, at the bottom of the outside of a rampart, where it joins the scarp or inner side of the ditch. It is almost on a level with the natural surface of the ground; and serves in part as a passage-way for the troops of the garrison, and in part as a means of preventing the ditch from being filled with earth and rubbish, when the rampart is battered by the besiegers.

BERMEJO, or VERMEJO, a river rising in Bolivia, flowing through several Argentine provinces, and joining the Paraguay about 30 m. above the mouth of the Parana. Its length is 1200 m., or double that of the direct line from head to mouth.

BERMOND'SEY, a s.e. suburb of London, on the s. bank of the Thames, and traversed by the Greenwich railway. It has extensive tanyards and wharfs. Pop. of parish (1871), 80,429.

BERMUDA GRASS, recently brought to the southern states from India; valuable both for pasturage and hay, especially in warm regions.

BERMU'DAS, or SOMMERS'S ISLES, were so named respectively from Bermudez, a Spaniard, who first sighted them in 1527, and from sir George Sommers, an Englishman, whose shipwreck here in 1609 was the immediate occasion of their being colonized from Virginia—itself only four years old—in 1611. This low and lonely archipelago is a mere group of specks, for, though it numbers perhaps 500 islets, yet it measures only about 12,000 acres in all; the whole occupying a space of about 20 m. in length by little more than 6 in breadth. The value of this natural fortress, which can hardly be overrated, arises from its situation. In lat. 32° 20′ n., and long. 64° 50′ w., the B. occupy, commercially and politically, a singularly commanding position. At a distance of 600 m. from cape Hatteras, in North Carolina, they are about equally remote from the n. of Maine and from the s. of Florida; again, between the two grand divisions of British America, they form an almost indispensable bond of union; and lastly, they flank, on either side, the two living highways which respectively lead from the n. Atlantic to the gulf of Mexico, and from the gulf of Mexico to the n. Atlantic. The four principal islands are—St. George's, 3½ m. in length; Bermuda, 15; Somerset, 3; and Ireland, 3, the breadth ranging between 2 m. and 1 furlong. The minor islands of St. David, Cooper, Smith, Long-Bird, Nonsuch, etc., form numerous picturesque creeks and bays of great size and depth, such as the Great Sound, Castle Harbor, Harrington Sound, and others. Most of the other members of the group are individually insignificant, many of them indeed without name or inhabitant. St. George's isle, the military station of the colony, commands the entrance of the only passage for large vessels—the narrow and intricate channel which leads to its landlocked haven being defended by strong batteries. From the strange shapes of most of the islands and the number of spacious lagoons, the communications are almost as necessarily by water as those of Venice; while the cedar-boats glide under the bluest sky, through an element so clear as to reveal, even to its lowest depths, the many varieties of excellent fish sporting among the coral rocks, and the exquisitely variegated shells. On the structure and formation of the archipelago, it is necessary merely to add, that it is the most northerly point on the globe where the living zoophyte still piles up its submarine architecture. The climate may be said to complete the paradise, resembling that of Persia, with the peculiar addition of a constant sea-breeze. Between Dec. and Mar., the thermometer ranges from 60° to 66°; in June, from 83° to 86°; and between April and Sept., from 75° to 79°. As the dew point ranges high, the air is moist at all seasons. With respect to productions, the entire soil presents under tillage of every description only 1227 acres; in grass for cattle-fodder, 33; and in wood or pasture, 10,339. Of the cultivated grounds, the main crops are potatoes, onions, and other garden-vegetables, arrow-root, maize, etc. Besides being useful as a station for those British vessels of war which are charged with the care of the West Indies on the one side, and the northern provinces on the other, Bermuda was formerly an important depot for convicts, but since the year 1862 it has ceased to be so. Between Bermuda and Halifax, Nova Scotia, there is a regular steamer carrying the mails. In 1871, the total pop. was 12,121. The numbers of white and colored persons are approximately in the proportion of five of the former to seven of the latter. The value of the exports for the year 1873 was £64,887, against £66,877 in the previous year; and that of the imports, £254,758 against £267,497. The governmental expenditure in 1874 amounted to £36,483. The revenue from rum shows a marked and progressive increase from the year 1865. In the B., emancipation has been decidedly beneficial, though here, as in Antigua, it was carried at once into full effect without the intermediate stage of apprenticeship. The group is under the authority of a governor, a council

of 9 members, and an assembly of 36. There are 12 free, and 9 private schools. With regard to religion, more than three-fourths of the population belong to the church of England, which has four clergymen. The Presbyterians, Wesleyans, and Roman Catholics have one minister each.

BERN, or BERNE, the most populous, and next to that of the Grisons, the most extensive canton of Switzerland; its area being nearly 2650 sq. m. It lies between lat. 46° 20′ and 47° 30′ n., and lon. 6° 50′ and 8° 27′ e. It has France on the n.; on the other three sides it is surrounded by its sister-cantons. B. is one of the three governing cantons of the Swiss confederation (since 1849 it has been the permanent seat of the Swiss government), and had, in 1877, a population of 532,632—about one fifth of the total inhabitants of Switzerland. Of these, 66,000 were Roman Catholics, the rest Protestants. The fertile valleys of the Aar and the Emmen divide the mountainous Alpine region in the s. from the Jura mountains in the north. The valleys of Simmenthal, Lauterbrunnen, Grindelwald, and Hasli, in the s., called the *Bernese Oberland*, are celebrated for their beauty. The lakes of Thun, Brienz, Neuchatel, and Bienne, are in B., which is watered by the Aar and its several tributaries. The climate, from the great difference in the elevations of the territory, is necessarily very variable, and subject to sudden changes, and frequent rains and fogs, but it is generally healthy. The districts of the Aar and the Emmen are the most fruitful, producing corn and fruits of various kinds, and affording excellent pasturage for cattle, which, with dairy produce, form the chief agricultural wealth of Bern. Corn and potatoes are not raised in sufficient quantities for home consumption. The vine grows in some districts, and hemp and flax in small quantities are raised. The horses of the Emmenthal are much prized. The lakes abound with salmon and trout. Iron, lead, and copper are found in the canton, which has also quarries of gypsum, marble, freestone, and granite. Its manufactures, which are not extensive, consist chiefly of linen, coarse woolens, leather, iron and copper wares, articles of wood, and watches. The canton is traversed by good roads, and its lakes and the river Aar are well supplied with steam-packets. The educational condition of the canton is good. B. entered the Swiss confederation, in which it now holds the second rank, in 1352. In the 15th and 16th centuries, it added to its possessions Aargau and Vaud, which it lost during the wars of the first Napoleon; but it received in return Bienne and its territory, and the greatest part of the bishopric of Basle. The present constitution of the canton, dating from 1846, is one of representative democracy.

BERN, capital of the above canton, is situated in lat. 46° 57′ n., and long. 7° 26′ e., on a lofty sandstone promontory, more than 1700 ft. above the sea, formed by the winding Aar, which surrounds it on three sides, and is crossed by two stone bridges, one of which is a magnificent structure, upwards of 900 ft. long, with a central arch 150 ft. wide and 93 ft. high. The fourth side was defended by fortifications, but these have been converted into public walks. B. has an imposing appearance from a distance, and a nearer view discloses one of the best and most regularly built towns in Europe, as it is the finest in Switzerland. The houses are massive structures of freestone, resting upon arcades, which are lined with shops, and furnish covered walks on both sides of the street. Rills of water flow through the streets, which are also adorned with numerous fountains. There are many fine public promenades in the environs, and the view of the Alpine peaks from the city is magnificent. The principal public buildings are a Gothic cathedral, founded in 1421, with some interesting tablets and relics; a new and magnificent structure, designed to accommodate the Swiss diet and administration; the mint, the hospital, and the university. B. has an interesting museum, and a valuable public library of 50,000 volumes. The manufacturing industry of B. is not great—gunpowder, firearms, leather, straw hats, and paper, are the chief articles. It has a considerable trade in the produce of the surrounding district. Pop. '70, 36,000. B. was founded by Berthold V., in 1191, who is said to have given it the name B., because he had killed a bear on the spot. A charter from Frederick II., in 1218, made it a free imperial city, and it gradually extended its possessions until it became an independent state; and between 1288 and 1339, successfully resisted the attacks of Rudolf of Hapsburg, Albert his son, and Louis of Bavaria. When the French entered B. in 1798, they found 30,000,000 of francs in the treasury. The corporate property of B. is very large—sufficient to defray all municipal expenses, provide the whole of the citizens with fuel gratis, and besides to leave a surplus for annual distribution among them. B. is the residence of foreign ministers; and since 1849, the permanent seat of the Swiss government and diet. Haller, the distinguished physiologist, was born at Bern. On account of the traditionary derivation of its name (old Suabian *bern*, a bear), bears have for several centuries been maintained in B. at the expense of the community. The French, when they captured B. in 1798, took possession of the bears, and sent them to the Jardin des Plantes, Paris; but the Bernese have since secured other specimens of their favorite animals, which are one of the "sights" of the city.

BERN, or BERNE, CONFERENCE or DISPUTATION OF, held in 1528, led to the establishment of the reformation in Bern. Some years before, the bishop of Lausanne demanded the indictment of certain preachers of reform doctrines, but the city council refused to interfere. The conflict increased steadily until, in Nov., 1527, the great council decided to settle disputes by appeal to the Word of God. Invitations were sent to

the principal bishops, and the leagues of both parties were asked to send delegates and learned men. The bishops declined, and Charles V. advised trust and recourse to the anticipated general council. But the B. council was held, and the event is considered to have been the turning-point in favor of the reformation. An account of the debates is found in D'Aubigne's *History of the Reformation.*

BERNADOTTE. See CHARLES XIV.

BERNALDA, a t. of s. Italy, in the province of Potenza, 32 m. w. by s. from Saranto. Pop. about 6000.

BERNALILLO, a large co. in New Mexico, bordering in part on Texas; 3000 sq.m.; pop. '70, 7591. It is watered by the Rio Grande del Norte, Rio de San Jose, and Rio Puerco. Co. seat, Albuquerque.

BERNARD, GREAT ST., *Mons Jovis,* a famous mountain-pass in the Pennine Alps, between Piedmont and the Valais. The pass attains an elevation of more than 8000 ft. above the sea-level; and almost on its very crest, on the edge of a small lake, which is frozen over 9 months out of the 12, stands the *hospice,* founded, in 962, by Bernard de Menthon, a Savoyard nobleman, for the benefit of pilgrims to Rome, and now largely taken advantage of by travelers across the Alps. The hospice, said to be the highest habitation in Europe, is occupied by 10 or 12 St. Augustine monks, who, with their noble dogs of St. Bernard breed, have rescued many hundred travelers from death by exposure to cold, or burial in the snow, which in winter ranges from 10 to 40 ft. in depth. The humanity of the monks shortens their own lives very considerably, the rigorous cold—which has been known to be 29°, and is frequently as low as 18° and 20° below zero F.—and the difficulty of respiration, often compelling them to leave with ruined health before they have completed the period of their vow—15 years. They enter on their humane mission at the age of 18. The hospice is a substantial stone-building, capable of affording sleeping-accommodation to 70 or 80 travelers, and shelter to about 300. As many as 500 or 600 persons have taken advantage of the hospitality of the monks in one day, and it is calculated that 8000 or 9000 travelers are annually indebted to their kindness. The resources of the monks are mainly derived from voluntary subscriptions and gifts, but they draw some trifle from independent property. Formerly, they had much more from this latter source, but a forced contribution of £4800 to the government of the canton of Valais impaired their revenues very much. The pass, which was traversed in early times by the Romans, Charlemagne, and Frederick Barbarossa, is celebrated for the passage of 30,000 French troops under Napoleon, in May, 1800.—LITTLE ST. B., which forms part of the chain of the Graian Alps, is the most convenient of the Alpine passes, and is supposed to have been the one by which Hannibal led his forces into Italy. It also possesses a hospice, which is situated 7192 ft. above the sea.

BERNARD, SAINT, of Clairvaux, one of the most influential theologians of the middle ages, was b. at Fontaine, near Dijon, in Burgundy, 1091; became a monk of Citeaux in 1113; founded a new branch of that order at Clairvaux, in Champagne, and himself became its first abbot in 1115; died Aug. 20, 1153; and was canonized by Alexander III., 1174. His ascetic life, solitary studies, and stirring eloquence, made him, during his lifetime, the oracle of Christendom. He was honored with the title of the "mellifluous doctor," and his writings were termed "a river of paradise." He rejected the doctrine of the immaculate conception, which had been introduced into the French church, and rose above the cruel prejudices of his age in repressing the monkish persecutions of the Jews in Germany. B. is perhaps most widely known in connection with the disastrous crusade of 1146. Charged by the pope to excite the religious zeal of the people of France and Germany, he accomplished his mission with fatally memorable success. Fields, towns, cities, and castles were in many places almost depopulated, and innumerable legions, fired by his prophetic eloquence, hurried to the east, nine tenths of whom never saw their homes again.

Regarding B. in his more spiritual aspect, we may say that his mystic, but at the same time practical, Christian doctrine was a wholesome antidote to the dry and cold scholasticism which prevailed among the churchmen of his age, although the intolerance with which he treated Abelard (see ABELARD) and Gilbert de Porrée must be reprobated. Luther says of St. B.: "If there ever lived on the earth a God-fearing and holy monk, it was St. B. of Clairvaux." In the course of his life, he founded 160 monasteries. His writings are exceedingly numerous. They consist of epistles, sermons, and theological treatises. Of the first, we possess 439; of the second, 340; and of the third, 12. They are all instinct with genius, though it is difficult for us now to appreciate their extraordinary influence. The best edition of the works of St. B. is that of Mabillon, printed at Paris in 1690 (2 vols. fol.), reprinted at Venice in 1750 (6 vols. fol.), at Paris in 1835–40 (4 vols. 8vo), and again in 1854 (4 vols. 8vo). The monks of the reformed branch of the Cistercians, which he instituted, are often called, after him, Bernardines. He gave name also, in France, to the nuns of the Cistercian order, which his sister, St. Humbeline, is said to have founded.

BERNARD, CLAUDE, a distinguished physiologist, was b. at Saint-Julien, near Villefranche, in the department of the Rhone, on the 12th July, 1813. He studied medicine at Paris; was admitted in 1839 as a pensioner in one of the hospitals; and in 1841,

became Magendie's assistant at the college of France. He graduated in 1843 as doctor in medicine, and ten years later, as doctor in science; and was appointed in Feb., 1854, to the chair of general physiology in connection with the faculty of sciences in Paris. The same year he was chosen member of the academy of sciences; and in 1855, he succeeded Magendie as professor of experimental physiology in the college of France. B.'s first researches were devoted to the physiological action of the various secretions of the alimentary canal. His memoir, published in 1844, in the *Gazette Médicale*, treats of the mechanism by which the gastric juice is secreted, and also of the modifications which alimentary substances undergo from that liquid. To the *Comptes Rendus* of the biological society he also contributed papers on the saliva, on the intestinal juice, on the influence of the different pairs of nerves on the digestive apparatus, and on the respiratory and circulatory systems. His first really original paper, however, was that on the function of the pancreas, in which he demonstrated that that viscus is the true agent of the digestion of fatty bodies. This essay obtained, in 1849, the grand prize in experimental physiology, and was printed in the *Comptes Rendus* of the academy of sciences in 1856. In 1849, appeared his first researches on the glycogenic function of the liver, establishing the doctrine that the blood which enters the liver does not contain sugar; while blood which leaves that organ, and goes to the heart by the hepatic veins, is charged with it. He also showed the influence of the nervous system on this function, and produced artificial diabetes by division of the pneumogastric. For this discovery, which was keenly criticised, but is now regarded as sound, he obtained, in 1851, the grand prize in experimental physiology. In 1852, he laid before the institute his experimental researches on the great sympathetic system, and on the influence exerted by division of this nerve on the animal heat. This paper procured him, for the third time, the prize of experimental physiology in 1853. Since 1854, when he succeeded Roux as member of the institute, he has continued his researches on the glycogenic function of the liver, and has also published his courses of lectures at the college of France, on *Experimental Physiology in its Application to Medicine* (1855–56); on *The Effects of Toxic and Medicated Substances* (1857); on *The Physiology and Pathology of the Nervous System* (1858); on *The Physiological Properties and the Pathological Alteration of the various Liquids of the Organism* (1859); on *Nutrition and Development* (1860); and his *Introduction to the Study of Experimental Medicine* (1865). In 1862, he became officer of the legion of honor; in 1867, commander; and in 1869 he was made a member of the academy. He died at Paris, 10th Feb., 1878.

BERNARD, Sir Francis, 1714–79; a colonial governor of Massachusetts and New Jersey; an English lawyer who favored the crown and brought troops into Boston, proroguing the general court because that body refused to vote supplies for the soldiers. In 1769, he was recalled, and his departure was made an occasion of general public rejoicing.

BERNARD, Jacques, 1658–1718; a native of Dauphiny, professor of philosophy and mathematics, and minister of the Walloon church at Leyden. He was educated at Geneva, and was minister over two churches in France, but was obliged to leave the country because he persisted in preaching the reformed doctrines in opposition to the royal ordinance. In Holland he was well received. He wrote an *Abridgment of the History of Europe* (unfinished), and began *Historical Letters* (continued by others). He wrote much for the *Bibliotheque Universelle; Negotiations, etc., at the Peace of Ryswick;* and continued Bayle's *Nouvelles de la Republique des Lettres.*

BERNARD, Simon, 1779–1839; a French engineer and gen.; aid to Napoleon; educated in the Paris polytechnic school. He served in several campaigns after 1800, and was conspicuous for defending Torgau for three months during a vigorous siege. He adhered to the restoration, but was ordered to leave France, which he did under permission to go to the United States. In this country he was employed by the government in devising canals and roads for connecting the great lakes and rivers, and also in coast defense and frontier fortifications, projecting fortress Monroe, and some of the defenses around New York. After the revolution of 1830, he returned to France, and prepared plans for the fortification of Paris. He was minister of war in 1834, and again in 1836–39.

BERNARD DOG, Great St., a race or variety of dog deriving its name from the hospice of St. Bernard, where it has been long kept by the monks for the purpose of assisting them in the rescue of perishing travelers. Dogs of different races are employed in the same manner at other passes of the Alps. The St. B. dog is remarkable for great size, strength, and sagacity. The dogs not only accompany the monks and servants of the hospice in the benevolent excursions which they regularly make through the most dangerous parts of the pass, but are sent by themselves to search for travelers who may have wandered, and this their extremely acute scent enables them admirably to do. They learn to know what places are most proper to be searched, and some of them show great alertness when the weather assumes a threatening aspect, as if desirous to be at their work. They carry a small flask of wine or brandy attached to their neck, of which the traveler may avail himself. When they find a traveler benumbed with cold, or discover by the scent that one has been overwhelmed in an avalanche, they endeavor by loud barking to attract the monks to the spot: if they fail in this, and if the traveler is

too much exhausted to proceed by their guidance to the hospice, or if they cannot by their own efforts dig away the snow which has covered him, they run to give the alarm by signs which are at once understood. One famous dog, called Barry, in the earlier part of the present century, was instrumental in saving the lives of no fewer than 40 human beings. His most memorable achievement was the rescue of a little boy, whose mother had been destroyed by an avalanche, and whom he induced to mount his back, and so carried him safe to the hospice. The skin of this dog is preserved in the museum of Bern.—The origin of this valuable race of dogs is not well ascertained, although they are supposed to have sprung from the progeny of a Danish dog left at the hospice by a traveler, and of the Alpine shepherds' dogs. Another account represents an English mastiff as one of their progenitors. There are two subvarieties, however; one with rough hair, like that of the Newfoundland dog, and of a white color, with black or tawny spots; the other, with close, short hair, more or less clouded with gray, liver-color, and black. Of the former breed, the number is now small. The head and ears resemble those of a water-spaniel, and the St. B. dog has therefore been sometimes classed with spaniels (q.v.).

BERNARDIN, SAINT, of Sienna, b. in 1380 at Massa-Carrara, of a distinguished family, made himself famous by his rigid restoration of their primitive rule amongst the degenerate order of the Franciscans, of which he became a member in 1404, after having already, in 1397, joined the brotherhood of the *Disciplinati Mariæ*. In 1438, he was appointed vicar-general of his order for Italy. B. was unwearied and devoted in his activity during the great Italian plague of 1400, both as an impressive preacher and an attendant upon the sick and dying. He founded the *Fratres de Observantia*, a branch of the Franciscan order, which already numbered more than 300 monasteries in Italy during his day. B. died in 1444, and was canonized by pope Nicholas V. in 1450, his festival being on the 20th of May. His eminently mystical works were published by Rudolf (4 vols., Venice, 1591), and by De la Haye (5 vols., Paris, 1636).

BERNARDINES. See CISTERCIANS.

BERNARDO DEL CARPIO, son of Don Sancho de Saldanha and Ximena, the sister of Alfonso II. of Leon, who had been secretly married. On learning of the affair the king imprisoned Don Sancho and had his eyes put out, and the wife was sent to a convent. The boy was brought up at court and gained early renown in the wars against the Moors, becoming one of the most famous soldiers of the 9th century. Incensed because he could not obtain his father's liberty, B. went over to the Moors and established himself in the strong castle of Carpio, whereupon the king promised to release the father if B. would surrender the fortress. It is uncertain what became of the father, who was not set free; but history states that B. went to France, where he became a wonderful knight errant. His name occurs frequently in romance, chronicles, ballads, and plays, and is the title of an epic poem published in 1624. Lope de Vega makes him a national hero and the conqueror of Roland at Roncesvalles.

BERNARD OF CLUNY, monk of Cluny, under the abbot Peter the venerable, about 1122–56; author of a long poem in Latin called *Contempt of the World*, which ranks with *Dies Iræ*, *Stabat Mater*, and other mediæval church literature. Several modern hymns are portions of B.'s poems, such as *Jerusalem the Golden*, *Brief Life is here our portion*, etc.

BERNAUER, AGNES, the beautiful daughter of a poor citizen of Augsburg, in the 15th c., whose sad story looks liker romance than history. Duke Albrecht of Bavaria, only son of the reigning duke Ernst, saw the maiden at a tournament at Augsburg, given in his honor by the nobility, and fell violently in love with her. Albrecht was young, handsome, and manly, and Agnes was not insensible to his attractions and his rank; but she was too pure to listen to his overtures till he promised to marry her. They were then secretly united, and Albrecht carried his young wife to the castle of Vohburg, which he inherited from his mother. Here they enjoyed their matrimonial happiness undisturbed, till Albrecht's father formed the plan of marrying his son with Anna, daughter of Erich, duke of Brunswick. The determined opposition he met with soon made him aware of his son's attachment to the Augsburger's daughter, and of the strength of his passion for her; and he resolved to take energetic measures to break it off. He accordingly contrived that, at a tournament at Regensburg, the lists were shut against his son, as one that, against the rules of chivalry, was living with a woman in licentiousness. Albrecht swore that Agnes was his wife, but in vain; he was still excluded. He now made Agnes be openly honored as duchess of Bavaria, gave her a numerous retinue of servants as a princess, and the castle of Straubing for a residence. She, full of sad forebodings of a dark fate, erected in the Carmelite convent of the place an oratory and a tomb. As long as duke William, Albrecht's uncle, lived, who was greatly attached to his nephew, nothing further was attempted against the happiness of the lovers. But after his brother's death, duke Ernst no longer restrained his anger, and, in the absence of Albrecht, ordered Agnes to be arrested and executed without delay. Accused of sorcery, by which she was alleged to have bewitched Albrecht, she was carried, bound hand and foot, by the executioners to the bridge of the Danube, and in the presence of the whole people thrown into the river (Oct. 12, 1435). The current having floated her again

to the side, one of the executioners ran with a long pole, and fastening it in her golden hair, held her under the water till she was drowned. Maddened at this atrocity, Albrecht took up arms against his father, and, in league with his other enemies, wasted the country. It was in vain that duke Ernst entreated his son to relent. It was not till the emperor Sigismund, and the other friends of the family, united their exhortations, that Albrecht at last returned to his father's court, where, after a time, he consented to marry Anna of Brunswick. To regain the forfeited regard of his son, duke Ernst had a chapel erected over the grave of the murdered lady, and Albrecht founded in the year of her death daily masses for her in the Carmelite monastery at Straubing; even after twelve years he renewed the foundation, and had the bones of his "honored wife" transferred to the tomb provided by herself, and covered with a marble monument. The unhappy loves of Albrecht and Agnes were long the theme of popular song; and the story has been made the subject of at least three tragedies, one by Jul. Körner (Leip. 1821), another by A. Böttger (3d ed. Leip. 1850).

BERNAY, a t. of France, in the dep. of Eure, pleasantly situated on the right bank of the Charentonne, 26 m. w.n.w. of Evreux. Pop. '76, 6087. Woolen, linen, and cotton manufactures are actively carried on, also paper-making, bleaching, dyeing, and tanning. There is a considerable trade not only in the products of these manufactures, but in grain, cider, horses, and cattle. B. is the seat of the greatest horse-fair in France, which is held in Lent, and is attended by nearly 50,000 persons, who congregate from all parts of France, chiefly to purchase post and diligence horses, for which Normandy has long been celebrated. B. is the seat of a tribunal of commerce. The church of St. Croix has a large and magnificent altar, and marble statues and sculptures: the church of La Conture was formerly celebrated for the cure of persons possessed of evil spirits. The grain-market occupies part of the remains of an interesting old abbey church. B. has a communal college, and a hospital.

BERNBURG, a t. in the German duchy of Anhalt, till 1863 capital of Anhalt-Bernburg, lies on the Saale, 23 m. s. of Magdeburg, in lat. 51° 47′ n.; long. 11° 45′ east. Two parts of B., surrounded by walls, lie on the left bank of the river, and are united by a bridge with the third part on the opposite side, which has a castle, but is not walled. B. is well built, has several literary and charitable institutions, and manufactures of porcelain, paper, and starch. Pop. '75, 16,929.

BERNERS, or BARNES, LADY JULIANA, prioress of Sopewell nunnery, near St. Albans, England, was a daughter of the sir James Berners who was beheaded in the reign of Richard II. The daughter was celebrated for beauty, spirit, and passion for field sports. One of the earliest productions of English printing is attributed to her pen: *The Treatyses pertynyng to Hawkynge, Huntynge, and Fysshinge with an Angle; and also a right noble Treatyse on the Lygnage of Cot Armours, endynge with a Treatyse which specifyeth of Blasynge of Armys.* A part of this was printed as early as 1486. The information on hunting is hitched into rhyme, but has no discernible relation to poetry.

BERNHARD, Duke of Weimar, a celebrated German general, was b. 6th Aug., 1604. He was the youngest of the eight sons of John, third duke of Saxe-Weimar. On the outbreak of the thirty years' war, he took the side of Protestantism against the emperor, and first distinguished himself in 1622 at the bloody battle of Wimpfen. Subsequently, he became colonel in the army of Christian IV., king of Denmark; took part in the bold expedition of Mansfield through Silesia to Hungary; and, after the sudden death of the latter, reunited himself with the Danes under the markgraf of Baden-Durlach. At the solicitations of his brothers, however, he now withdrew from the Danish service, and returned to Weimar in Mar., 1628. Three years later, Gustavus Adolphus made his appearance in Germany, and B. was one of the first who flew to his standard. After a brilliant career, he became suddenly ill, and died at Neuburg on the Rhine, 8th July, 1639; according to some, of a pestilential disorder then prevalent in the camp; but according to B.'s own opinion, and that of others, of poison, administered by his physician, Blandini, who is supposed to have been in the pay of France.

BERNHARDT, SARA, b. about 1845; the daughter of a Jewish father and a Dutch mother. The mother brought her, a mere child, from Amsterdam to Paris, and placed her in a convent at Versailles, where she remained several years. On leaving the convent she was asked what she intended to become. The reply was, "An actress at the Comédie Français, or a nun." Obtaining admission to the conservatoire she soon exhibited marks of talent. She made her first appearance in 1862 as *Iphigenica*, in Victor Hugo's version of the old Greek tragedy of *Iphigeneia in Aulis*, and she was at once successful. Afterwards at the Comédie, at the Gymnase, at the Porte St. Martin, and others, she appeared in such plays as *Phædre*, *Britannicus*, *The Marriage of Figaro*, *The Stranger*, *Rome Vaincu*, etc., always with increasing success. Perhaps her strongest character is *Donna Sol*, in Victor Hugo's *Hernani*. In 1879, she appeared in London with great success. Efforts, thus far unsuccessful, have been made to bring her to the United States. She is not only an actress of wonderful brilliancy, but a sculptor of no mean repute, and also something of a painter. In person she is remarkable; a thin, attenuated, nervous organization, but little more than a skeleton, but as full of life as the most robust of creatures. Her private life is peculiar; she dresses for the most part in trousers and pea-jacket, a

suit that might well enough be worn by a man, and she exercises all the legitimate freedom that might become a young and independent bachelor.

BERNI, Francesco, called also Berna or Bernia, a favorite Italian poet, from whom comic or jocose poetry has the name of *Versi Berneschi*, was born at Campovecchio, in Tuscany, about 1490. He first entered the service of cardinal Dovizio da Bibiena, and was afterwards for several years secretary to Ghiberti, chancellor to Clement VII., and bishop of Verona. About 1533, he betook himself to Florence, where he was made a canon, and lived in favor with the two Medici, duke Alessandro, and cardinal Ippolito, till his death in 1536. His *Opere Burlesche* (2 vols., Flor. 1548; Lond. 1721) are to be found in the *Classici Italiani* (Mil. 1806). His recast or rifacimento of Boiardo's *Orlando Innamorato* was received with such favor that it was thrice reprinted from 1541 to 1545. A critical edition was published at Florence, 1827. Berni's version, or dilution, is still read in Italy, in preference to the original.—Count Francesco Berni, b. 1610, d. 1693, the author of eleven dramas, and some lyric pieces, is not to be confounded with the former Berni.

BERNIER, François, a French physician and traveler, was born at Angers, in France. Having taken his degree of doctor at Montpellier, he departed for the east about 1654, and visited Syria, Egypt, Arabia, and India, in the last of which countries he resided for twelve years in the capacity of physician to Aurungzebe. On his return to France, he published an account of his travels in India in 1670–71. The work is delightful in style, accurate in the delineation of manners and customs, as well as in the descriptions of places, and clear in the exposition of the causes of those political events that carried Aurungzebe to the throne. He visited England in 1685, and died at Paris on the 22d of Sept., 1688.

The titles of his chief works are as follows: *Voyages de M. Bernier contenant la Description des Etats du Grand Mogol, de l'Indoustan, du Royaume de Cachemire*, etc.; *Mémoire sur le Quiétisme des Indes; Abrégé de la Philosophie de Gassendi; Sentiment de M. Descartes.*

BERNI'NA, a mountain of the Rhætian Alps, upwards of 13,000 ft. high, in the Swiss canton of Grisons, with a remarkable and extensive glacier, Morteratsch. The B. pass, which attains an elevation of 7695 ft., and over which a carriage road has been constructed, unites the valleys of the Engadine and Bregaglia on the n. with the Valteline on the s., but is dangerous on account of avalanches.

BERNI'NI, Giovanni Lorenzo, a famous Italian sculptor and architect in the time of pope Urban VIII., was b. at Naples, 1598. He early devoted himself to sculpture, and in his eighteenth year finished his admired group of Apollo and Daphne, which gave promise of greater excellence than was afterwards realized by the artist. Pope Urban VIII. employed B. to produce designs for the embellishment of the Basilica of St. Peter at Rome. The bronze *baldacchino*, or canopy, covering the high-altar of that edifice, the palace Barberini, the front of the college de Propaganda Fide, the church of Sant' Andrea à Monte Cavallo, and numerous ornaments in St. Peter's, are by Bernini. His greatest work in architecture is the colossal colonnade of St. Peter's. In 1665, B. accepted the flattering invitation of Louis XIV., and traveled to Paris with a numerous retinue and great pomp. In Paris, he resided above eight months; but not wishing to interfere with the designs of Claude Perrault for the Louvre, he confined himself entirely to sculpture. His visit, however, proved a highly remunerative one. Richly laden with gifts, he returned to Rome, where he died, Nov. 28, 1689, leaving a large fortune (about £100,000) to his children. Besides his works in sculpture, B. also left numerous paintings behind him. No artist, perhaps, was ever so much admired and rewarded during his lifetime as B.; but time has rather subtracted from than added to his fame.

BERNOUIL'LI was the name of a family that produced a succession of men, who became famous over all Europe for the successful cultivation and extension of various branches of mathematical and physical science. The family originally resided in Antwerp, whence, in 1583, its attachment to the reformed religion forced it to seek an asylum in Frankfort. Afterwards, the Bernouillis settled in Basel, where they achieved the highest professional honors. Eight of them became highly distinguished; but special mention can be made here only of the three most celebrated—James, John, and Daniel.

James B. was b. at Basel, 25th Dec., 1654, where he also d., 16th Aug., 1705. He devoted his life to the study of mathematics, of which he became professor in the university of Basel, succeeding in that chair the distinguished Megerlin. Among his first works were, *A Method of Teaching Mathematics to the Blind*, and *Universal Tables on Dialling*. These were followed by *Conamen Novi Systematis Cometarum*, being an essay on comets, suggested by the appearance of the comet of 1680; and an essay *De Gravitate Ætheris*. Besides a variety of memoirs on scientific subjects, he published no other work of importance. *De Arte Conjectandi* was a posthumous work concerning the extension of the doctrine of probabilities to moral, political, and economical subjects. His memoirs will be found in the *Journal des Savans and Acta Eruditorum;* his collected works were published in 2 vols. 4to, at Geneva, in 1744. Among his triumphs are to be recorded his solution of Leibnitz's problem of the isochronous curve, his determination

of the catenary, and investigation of the properties of isoperimetrical figures. At his request a logarithmic spiral was engraved on his tomb, with the motto, *Eadem mutatâ resurgo.*

JOHN B., brother of the preceding, was b. at Basel, 27th July, 1667. He and James were the first two foreigners honored by being elected associates of the academy of sciences at Paris, and members of the academy of Berlin. John devoted himself to chemical as well as to mathematical science. In 1694, he became a doctor of medicine, and soon after professor of mathematics at Gröningen, whence he only removed to succeed his brother James in the university of Basel. His forte was pure mathematics, in which he had no superior in Europe in his day. He died 1st Jan., 1748. Among his achievements are the determination of the "line of swiftest descent," and the invention of the "exponential calculus." His collected works were published at Geneva, in 4 vols. 4to, 1742; and his correspondence with Leibnitz, in 2 vols., 1745.

DANIEL B., b. at Gröningen, 9th Feb., 1700, d. at Basel, 17th Mar., 1782, was the son of John. Like his father, he devoted himself to medicine as well as to mathematics. The family reputation early helped him to the professorship of mathematics at St. Petersburg, which he held for several years. Thence, however, he ultimately retired to Basel, much against the will of the czar. At Basel, he occupied in succession the chairs of anatomy and botany, and of experimental and speculative philosophy. He published various works between 1730 and 1756, of which the chief are concerned with pneumatical and hydro-dynamical subjects. [This name is preferably, BERNOULLI.]

BERNOULLI, JACQUES, brother of the third John, b. 1759. His inclination was towards geometry, in which he received instruction from his father and afterwards from his uncle Daniel. At the age of 21 he undertook the duties of the chair of experimental physics, which his uncle resigned on account of old age. He advanced rapidly, and soon became a member of each of the scientific societies of the continent. In 1789, he married a grand-daughter of the great mathematician, Euler, but the wedding was followed in a few weeks by the drowning of the husband in the Neva. His papers are in the Acts of the St. Petersburg academy, and in other academical memoirs.

BERNOULLI, JEAN, 1710–90; youngest brother of Nicolas; he studied mathematics and law, and was for five years professor of eloquence in the university of Basel. He succeeded his father as professor of mathematics, and was thrice a successful competitor for prizes of the Paris academy of sciences. He was a friend of Maupertuis, who died in his house.

BERNOULLI, JEAN, 1744–1807; one of the three Bernoullis named John, distinguished in science—grandfather, father, and son. At the age of 13 he took the degree of doctor in philosophy, and at 19 was made astronomer royal of Berlin. He traveled in England and over Europe, and his writings consist of travels, and works on astronomy, geography, and mathematics. In 1774, he published a French translation of Euler's *Elements of Algebra.*

BERNOULLI, NICOLAS, 1695–1726; the eldest of three sons of John B., the mathematician. Nicolas at the age of 8 could speak German, Dutch, French, and Latin; at 16 he took the degree of doctor in philosophy from the university of Basel, and at 20 he received the highest degree in law. He filled the chair of jurisprudence at Bern, and he and his brother Daniel were at the same time professors of mathematics in the academy of St. Petersburg, where Nicolas died at the age of 31. The empress Catherine honored his memory with a public funeral.

BERNOULLI, NICOLAS, 1687–1759; cousin of Nicolas, Daniel, and John, son of a senator of Basel. He was a friend of Newton and Halley, visiting them in England. He filled the mathematical chair at Padua, once occupied by Galileo, and was professor of logic and law at Basel. He edited some of his uncle James's works, and his own writings are in the *Acta Eruditorum*, and the learned publications of the period.

BERNSTEIN, GEORGE HEINR., a distinguished orientalist, professor of oriental languages in the university of Breslau, was b. 12th Jan., 1787, at Kospeda, near Jena, where his father was pastor. In 1806 he entered the university of Jena, where he devoted himself to the study of theology, philosophy, and eastern languages. In 1812 he was appointed extraordinary professor of oriental literature in Berlin, and in 1821, regular professor. In 1843, he was appointed to Breslau. Besides a number of lesser treatises, and of contributions to scientific and critical journals, he established his reputation as an oriental scholar by the publication of an Arabic poem of Szafieddin of Hilla (Leip., 1816). But his greatest achievements were in Syriac literature. Besides several pamphlets, expository and critical, which appeard between 1837 and 1847, B. has given in his lexicon to Kirsch's *Chrestomathia Syriaca*, of which he brought out a new edition (2 vols., Leip. 1832–36), proofs of his diligent and successful research in the domain of Syriac lexicography. He contemplated publishing a great Syriac lexicon, but did not live to complete the work. He died 7th April, 1860.

BERNSTORFF, ANDREAS PETER, Count, 1735–97; cousin of Johann, and also a statesman of Denmark, privy councilor, and minister of foreign affairs. He first pro-

posed armed neutrality to Sweden. Late in life he prepared for the abolition of serfdom in Schleswig-Holstein, and gave full liberty to the press of that duchy.

BERNSTORFF, JOHANN HARTWIG ERNST, Count, 1712–72; a Danish statesman who was the representative of the government at the diet of Ratisbon; minister to France, secretary and councilor of state, and member of the privy council in charge of foreign affairs. Frederick the Great styled B. the "Oracle of Denmark." Struensee put him out of office in 1770, but he was recalled two years later, just before his death.

BE'RÖE, a genus of *acalephæ* (q.v.), of a division distinguished as *ciliogradæ*, i.e., moving by means of *cilia* (q.v.), very different from the medusæ, and of higher organization. This genus is now the type of a family characterized by a nearly globular or oval body, of a delicate jelly-like substance, with an alimentary canal passing through its axis, which is vertical as the animal floats in the water; the body strengthened by bands of somewhat firmer texture, "which run like meridian lines from pole to pole." These bands are covered with rows of large cilia, the motion of which is extremely rapid, and is evidently controlled by the will of the animal, so that it swims with rapidity, and easily changes its course. The motion of the cilia causes a beautiful iridescence: the animals also are phosphorescent by night. *B.* (or *cydippe*) *pileus* (figured in the article ACALEPHÆ) is a beautiful little creature, very abundant in the sea on many parts of the British coasts. It is provided with two very long and slender tentacula, which proceed from the sides of the body, and are covered with a great number of still finer filaments. These organs are probably employed for seizing food. This, and other kinds of B., form a great part of the food of whales.

BERŒ'A, or BERE'A, a city of ancient Macedonia, at the foot of Mt. Bermius, visited by St. Paul, who preached there. The modern Veria, 35 m. w. of Salonica, is on or near the site of Berœa.

BERO'SUS, an educated priest of Babylon, who had a knowledge of the Greek language, and probably lived about 260 B.C. He wrote, in Greek, three books of Babylonian-Chaldean history, in which he made use of the oldest temple archives of Babylon. The work was highly esteemed by Greek and Roman historians, but unfortunately only a few fragments have been preserved by Josephus, Eusebius, Syncellus, and others. Even these fragments are of great value, as they relate to the most obscure portions of Asiatic history. They have been edited by Richter in his *Berosi Chaldæorum Historiæ quæ supersunt*, 1825. The *Antiquitatum Libri Quinque cum Commentariis Joannis Annii*, first published in Latin by Eucharius Silber (Rome, 1498) as a work of B., and often republished, was the pseudonymous work of the Dominican, Giovanni Nanni of Viterbo.

BERRE, ETANG DE, an extensive lagoon of France, department Bouches-du-Rhône, with large salt-works and eel-fisheries. It discharges its surplus waters into the sea by the Port-du-Bouc.

BERRIEN, a co. in Georgia, on the Alapaha and Little rivers; intersected by the Brunswick and Albany railroad; 750 sq.m.; pop. '80, 6,619—803 colored. Surface level, with much woodland. It produces corn, rice, cotton, etc. Co. seat, Nashville.

BERRIEN, a co. in s.w. Michigan, bordering on Indiana; intersected by the Chicago and Michigan, the Lake Shore, and the Michigan Central railroads; 600 sq.m.; pop. '80, 36,780; drained by the Pawpaw and St. Joseph's rivers. The surface is nearly level; the soil a deep loam, bearing forests of hard timber. Productions entirely agricultural. Co. seat, Berrien Springs.

BERRIEN, JOHN MACPHERSON, 1781–1856; b. N. J.; a lawyer, solicitor, and afterwards judge of the eastern district of Georgia; member of the Georgia legislature and of the U. S. senate; attorney-general in Jackson's first cabinet; elected again to the senate in 1840, and in 1846.

BERRY, *Baccа*, the term employed in botany to designate a description of fruit more or less fleshy and juicy, and not opening when ripe. The inner layers of the pericarp (q.v.) are of a fleshy or succulent texture, sometimes even consisting of mere cells filled with juice, whilst the outer layers are harder, and sometimes even woody. The seeds are immersed in the pulp. A B. may be one-celled, or it may be divided into a number of cells or compartments, which, however, are united together not merely in the axis, but from the axis to the rind. It is a very common description of fruit, and is found in many different natural families, and both of exogenous and endogenous plants. As examples, may be mentioned the fruits of the gooseberry, currant, vine, barberry, bilberry, belladonna, arum, bryony, and asparagus, which, although agreeing in their structure, possess widely different properties. Some of them, which are regarded as more strictly berries, have the calyx adherent to the ovary, and the placentas—from which the seeds derive their nourishment—parietal, that is, connected with the rind, as the gooseberry and currant; others, as the grape, have the ovary free, and the placentas in the center of the fruit.—The orange and other fruits of the same family, having a thick rind dotted with numerous oil-glands, and quite distinct from the pulp of the fruit, receive the name *hesperidium;* the fruit of the pomegranate, which is very peculiar in the man-

ner of its division into cells, is also sometimes distinguished from berries of the ordinary structure by the name *balausta*. See POMEGRANATE. Fruits like that of the water-lily, which at first contain a juicy pulp, and afterwards, when ripe, are filled with a dry pith, are sometimes designated *berry-capsules*. The gourds, also, which at first have 3 to 5 compartments, but when ripe, generally consist of only one compartment, are distinctively designated by the term *pepo*, *peponium*, or *peponida*, to which, however, *gourd* may be considered equivalent.

BERRY, or BERRI, one of the old French provinces (now forming the departments of Indre and Cher (q.v.), in lat. 46° 10′ to 47° 40′ n., and long. 1 to 3° e., its greatest length being about 100 m., and its greatest breadth 90. Having come into the possession of the French crown, it gave title at various times to French princes, the younger son of Charles X. being the last who held it.

BERRY, CHARLES FERDINAND, Duke de, second son of the count of Artois (afterwards Charles X.) and of Maria Theresa of Savoy, was born at Versailles, Jan. 24, 1778. In 1792, he fled with his father to Turin; fought with him under Condé against France; afterwards visited Russia, and lived for some time in London and Edinburgh. In 1814 he returned to France, and the following year was appointed by Louis XVIII. commander of the troops in and around Paris. In 1816, he married Caroline Ferdinande Louise, eldest daughter of Francis, afterwards king of the Two Sicilies. On this marriage the continuance of the elder Bourbon line depended. The duke de B. was assassinated on the 13th Feb., 1820, as he was conducting his wife from the opera-house to her carriage, by a person named Louvel. He left only one daughter, Louise-Marie-Thérèse d'Artois, mademoiselle de France, born 1819; but on the 29th Sept., 1820, the widowed duchess gave birth to the prince, Henry, duke of Bordeaux, afterwards styled count of Chambord. After the July revolution, 1830, in which the duchess exhibited immense force of character and courage, offering herself to lead on the troops against the insurgents, she, with her son, followed Charles X. to Holyrood, but left a considerable party in France in favor of the pretensions of her son as Henry V. of France. During a visit to Italy, the duchess was so far encouraged in her ambition, that a project was formed for reinstating the Bourbons in France; and, accompanied by several friends, she landed near Marseilles, April 29, 1832. After many adventures, she was betrayed, and was imprisoned in the citadel of Blaye. The confession of the duchess, that she had formed a second marriage with the Neapolitan marquis, Lucchesi-Palli, destroyed at once her political importance, and the government set her at liberty. She died in 1870.

BERRYER, PIERRE ANTOINE, a distinguished French advocate and party politician, was born in Paris, 4th Jan., 1790, and first distinguished himself by his defense of victims of the restoration. In 1829, he was chosen deputy, and ever afterwards steadily represented the rights and policy of the elder Bourbons. His legitimist tendencies kept him for a time in the political background under Louis Philippe; but as the legitimist party in the chamber increased, his position grew in importance. He repeatedly undertook the defense of persons prosecuted by the government, not only of his own party, but republican leaders. It was he who defended Louis Napoleon in the chamber of peers after the Boulogne *attentat*. With the elder Bourbons he was in constant communication, and was one of the heads of the legitimist party who made a pilgrimage to the count of Chambord in London, in 1843. After the revolution of 1848, he represented the Bouches-du-Rhône: seemed inclined to support the government of the president, Louis Napoleon; and became a member of his privy-council. But this did not hinder him from going to Wiesbaden, in 1850, to do homage to the count of Chambord. On that occasion, he was openly spoken of as the future minister of Henry V. When Changarnier was removed from his command, B. united with Thiers and others to oppose the pretensions of the president, and he was one of the few who boldly protested against the *coup d'état*. In 1854, he was elected a member of the French academy. His inaugural speech contained some uncomplimentary allusions to the lower empire, and its publication was prohibited, the prohibition, however, being removed in 24 hours. B. added greatly to his reputation as an orator by his defense of Montalembert (q.v.) against the government prosecution in Nov., 1858. He died 29th Nov., 1868.

BERSAGLIE'RI is the name given to the riflemen or sharpshooters of the Italian army. After the disastrous campaign of Charles Albert against the Austrians in 1848–49, and the abdication of that monarch, his son, Victor Emmanuel, commenced a remodeling of the Sardinian army. One improvement, brought about by gen. Alessandro della Marmora, was the formation of a corps of bersaglieri. These were light active soldiers, dressed in a picturesque but serviceable dark-green uniform, and armed with long rifles. Two battalions of these riflemen formed part of the Sardinian army during the Crimean war. On the 16th of Aug., 1855, they took part in the battle of the Tchernaya. During the Italian war of 1859, the B. were engaged in many operations requiring dash and brilliancy. There are over 40,000 B. in the regular army.

BER'SERKER (*ber*, bare, and *serkr*, shirt of mail), a redoubtable hero in Scandinavian mythology, the grandson of the eight handed Starkader and the beautiful Alfhilde. He despised mail and helmet, and, contrary to the custom of those times, went always into battle unharnessed, his fury serving him instead of defensive armor. By the daughter

of King Swafurlam, whom he had slain in battle, he had twelve sons, who inherited the name of B., along with his warlike fury.

BER'SERKER (*bare serk*, or only in a shirt; i.e., without mail), a class of combatants among the early Norse people whose love of fighting led them to a fury of madness. They were so wild that chains could hardly restrain them. Friend or foe, bare breast or buckler, stick or stone, dead or living, all were the same to the berserker when the fit was on, and he wandered aimlessly forth, "running an Indian muck at all he met." In later times the title was given to companies of hard fighters who were retained as body guards or special champions of renowned leaders. These periodical fits of rage were called the "berserk's course." When under his mad influence, the B. was a raging wolf to his friends and an armed maniac to his enemies. In the *Ynglinga Saga* we read: "But his (Odin's) men rushed forward without mail, and were as mad as dogs and wolves, and bit upon their shields, and were as strong as bears or bulls. Men slew they, and neither fire nor iron laid hold upon them."

BERTH, or BIRTH, in nautical language, is nearly equivalent to *room* or *space*. A ship's B. is the space which she occupies when at anchor, including a small breadth of sea all around her. The same name is also given to a messing or sleeping room on board ship, in a sense not very different from that of the word *cabin*. To "B." a ship's crew, is to allot to each man the place where his hammock, etc., are to be placed. In the third-class cabins of passenger-steamers, where many sleep in one room without partitions or divisions, each one's crib or bed-place is his berth.

BERTHA, the name of several famous women of the middle ages, half-historical, half-fabulous (see BERCHTA). ST. BERTHA, whose day is kept on the 4th July, was the beautiful and pious daughter of Charibert, king of the Franks, who having married (560 A.D.) Æthelbert, king of Kent, became the means of his conversion, and of the spread of Christianity among the Anglo-Saxons. In the romances of the Charlemagne cycle, there figures a BERTHA, called also Berthrada with the big foot, as the daughter of count Charibert of Laon, wife of Pepin the little, and mother of Charlemagne. In the romances of the *Round Table*, again, BERTHA is the name of a sister of Charlemagne, who makes Milo d'Anglesis the father of Roland. Better known is BERTHA, daughter of Burkhard, duke of the Alemanni, and wife of Rudolf II., king of Burgundy beyond Jura, who, after Rudolf's death (937), acted as regent for her infant son, Konrad; afterwards married Hugo, king of Italy; and died towards the close of the 10th century. This queen had the character of an excellent housekeeper, and is represented on seals and other monuments of the time as sitting on her throne spinning.

BERTHIER, a co. in Canada, province of Quebec, on the St. Lawrence river, above lake St. Peter; fronting about 10 m. on the river and running back without definite bounds into the unexplored region below Hudson's bay; pop. '71, 19,804. Chief town, Berthier, 46 m. e. of Montreal.

BERTHIER, ALEXANDRE, Prince of Neuchatel and Wagram, and marshal of the French empire, was b. at Versailles, Nov. 20, 1753. His father, a military engineer, trained him for the army, which he entered in 1770, and fought with Lafayette in the American war of independence. At the outbreak of the French revolution, he was appointed maj.gen. of the national guard of Versailles, and rose to be a gen. of division, and chief of the staff in the army of Italy, 1795; and in 1798, in the absence of Bonaparte, entered the papal territory, and proclaimed the republic in Rome. He accompanied Napoleon to Egypt in the same year as chief of the staff, a post which he also held in all the subsequent campaigns. At the revolution of 18th Brumaire (1799), he became war minister, and (till 1808) as such signed many important treaties and truces. He always accompanied the emperor, and often rendered important services; for the part he took in the battle of Wagram, he received one of his many distinctions. B. was Napoleon's proxy in the marriage of Maria Louisa, at Vienna, 1810. In the campaigns of 1812, 1813, and 1814, he was constantly by the emperor's side, and acted both as chief of the staff and as quartermaster-general. It was only B.'s love of order, quick insight, and activity that could have superintended the movements of so many armies. Napoleon did him full justice on this score, asserting at the same time that he was incapable of leading the smallest *corps d'armée* alone.

On the fall of Napoleon, B. hardly showed due gratitude for the favors heaped upon him. He had to surrender the principality of Neuchatel; and not to lose more, he submitted to Louis XVIII., who made him a peer and marshal, with the title of captain of the guards. Napoleon, who never doubted his secret attachment, made overtures to him from Elba: these he neither answered nor yet revealed to Louis, which made him suspected by both. On the return of Napoleon from Elba, in a fit of irresolution B. retired to Bamberg, in Bavaria, to his father-in-law, duke William, where his mind became unhinged with the conflict. On 1st July, 1815, while looking from the balcony of the palace at a division of Russian troops marching towards the French frontier, the bitter sight was too much—he threw himself down into the street, and thus ended his life. His *Mémoires* appeared in 1826.—He had two brothers, Victor Leopold, and Cæsar, who both served with distinction, and rose to be generals.

BERTHOLD OF RATISBON, about 1215–72; a Franciscan friar and famous outdoor preacher, working in Switzerland and Germany. His sermons have been published in modern German.

BERTHOLLET, Count CLAUDE LOUIS, one of the most distinguished theoretical chemists of his time, was b. at Talloire, a village of Savoy, near Annecy, on the 9th Dec., 1748. He studied at the university of Turin, and obtained a medical degree there in 1768. He afterwards went to Paris, where he was appointed physician to the duke of Orleans. He now applied himself with great assiduity to chemistry; in 1781, he was elected a member of the academy of sciences, and, some time after, the government made him superintendent of dyeing processes. In this situation he published a very valuable work on dyeing. In 1785, he announced his adherence to the antiphlogistic doctrines of Lavoisier, with the exception that he did not admit oxygen to be the acidifying principle, and herein he has proved to be right. In the same year, he published a paper on "dephlogisticated marine acid"—now called chlorine—pointing out its use for bleaching purposes; and following up the experiments of Priestley, he showed ammonia to be a compound of three volumes of hydrogen gas, and one volume of azotic gas. During the early part of the French revolution, B. traveled through the country, giving instruction as to the best means of extracting and purifying saltpeter to be used in the manufacture of gunpowder, and also as to the process of smelting and converting iron into steel. His joining the expedition of Napoleon to Egypt led to the formation of the institute of Cairo. On his return from Egypt, he was made a senator by Bonaparte, who also conferred on him several marks of honor, and made him a count. Notwithstanding, he voted for the deposition of Napoleon in 1814. On the restoration of the Bourbons, he was made a peer; but all his honors never made him other than a simple and unassuming gentleman. Besides the additions to chemical knowledge already mentioned, he, in conjunction with Lavoisier, and two other chemists, promulgated a new chemical nomenclature which has proved valuable to science. He died at Paris, 7th Nov., 1822.

BERTHOLLE'TIA. See BRAZIL NUTS.

BERTIE, a co. in North Carolina, on Albemarle sound, between the Chowan and Roanoke rivers; 900 sq.m.; pop. '70, 12,950—7437 colored. Level and fertile, producing corn, sweet potatoes, cotton, etc. Co. seat, Windsor.

BERTINO'RO, a t. of Italy, in the province of Forli, formerly belonging to the Papal states, six m. s.e. from Forli, pleasantly situated on a hill, the slopes of which are famous for their wines. At the foot of the hill, to the w., flows the Ronco. B. is the seat of a bishop, and has a cathedral, three other churches, and five convents. It was one of the ancient fiefs of the Malatesta, by whom it was given to the church. Pop. of commune 6388.

BERTIN, LOUIS FRANÇOIS, called Bertin l'Ainé, an eminent French journalist, was b. in Paris, 1766. He began writing for the press in 1793, and in 1799 set on foot the *Journal des Débats* (q.v.). B.'s royalist principles offended the government of Napoleon, and cost him imprisonment and banishment to Elba; whence, however, he escaped to Rome, where he formed a friendship with Châteaubriand. In 1804, he returned to Paris, and resumed the editorship of the *Débats*, but was much hampered by Napoleon, who imposed on the paper the title of *Journal de l'Empire*, and by subjecting it to police revision, gave it almost an official character. When B., in 1814, became free to follow his own bent, the journal reverted to its royalist principles. During the Hundred Days, it fell into other hands, till the return of the Bourbons restored it once more to B., who, in the meantime, had taken part in the *Moniteur de Gand*. Throughout the restoration, B. gave almost constant support to the ministerial party. Though he did not join in the protest of the liberal journals against the *ordonnances*, he gave his adhesion to the July monarchy, and continued faithfully to support it. He continued to edit the *Débats* till his death, 13th Sept., 1841.

BERTIN, LOUIS MARIE ARMAND, son of the former, was b. in Paris, 1801, and became, after the restoration, secretary to Châteaubriand during his embassy in England. In 1820, he joined the editorial staff of the *Journal des Débats*, and at his father's death assumed the chief direction. As a journalist, he contrived, as well as his father, to maintain a certain independence of the government. B. died at Paris, Jan. 11, 1854.

BERTRAND DE BORN. See BORN.

BERTRAND, HENRY GRATIEN, Count, one of Napoleon's generals, known for his faithful attachment to the emperor through all his fortunes, was b. at Châteauroux, 1773, and early entered the armies of the revolution as engineer. He accompanied the expedition to Egypt, and directed the fortification of Alexandria. Returning with the rank of gen. of brigade, he distinguished himself at Austerlitz, and became the emperor's adjutant; and after the battle of Aspern, in 1809, for establishing bridges over the Danube, he was created count and governor of Illyria. After sharing with credit in the subsequent campaigns, he retired with the emperor to Elba, was his confidant in carrying out his return to France, and finally shared his banishment to St. Helena. On Napoleon's death, B. returned to France, where, though sentence of death had been pronounced upon him—a sentence which Louis XVIII. had wisely recalled—he was restored to all his dignities, and, in 1830, appointed commandant of the polytechnic school. He

formed part of the expedition which, in 1840, brought back the remains of Napoleon to France. His death took place at Châteauroux, 31st Jan., 1844.

BERVIC, CHARLES CLEMENT BALVAY, a celebrated French engraver, was b. at Paris in May, 1756. In 1790, he made himself famous by a full-length engraving of Louis XVI., from the picture by Callet, one of the finest works of the kind ever produced. The engravings of the Laocoon, Regnault's "Education of Achilles," and Guido's "Rape of Deianira," also from B.'s graver, display equal beauty of manipulation, and fully higher power. B. died Mar. 23, 1822.

BERWICK, JAMES FITZ-JAMES, Duke of, was the natural son of James II., by Arabella Churchill, sister of the duke of Marlborough. He was b. in 1670, in France, where he was educated, and entered the army. After serving in Hungary under Charles of Lorraine, he returned to England shortly before the revolution of 1688, which he exerted himself to prevent. In 1689, he accompanied his father in his Irish expedition, and after the death of St. Ruth, had the nominal chief command. He next served in Flanders, under marshal Luxembourg, and afterwards under the duke of Burgundy and marshal Villeroi. In 1706, he was created a marshal of France, and sent at the head of an army to Spain, where he established the throne of Philip V. by the decisive victory of Almanza. For this important service, he was made a grandee of Spain, under the title of duke of Liria and Xerica. After several years of inactivity, he received the command, in 1734, of an army intended to cross the Rhine. While besieging Philipsburg, he was killed by a cannon-ball. Contemporary testimony, confirmed by his military conduct, shows B. to have possessed some of the best qualities of a great commander. His defensive campaign in 1709, in Provence and Dauphiné, against the superior force of the duke of Savoy, has always been regarded as a triumph of strategic skill. He was twice married. His son by the first marriage succeeded to the dukedom of Liria; his dukedom (De Fitz-james) and estates in France passed to his children by the second marriage.

BERWICK, NORTH, a seaport t. in Haddingtonshire, at the entrance to the firth of Forth, 19 m. e.n.e. of Edinburgh. Formerly a fishing-village, N. B. has now become a fashionable watering-place. It unites with Lauder, Dunbar, Jedburgh, and Haddington, in returning one member to parliament. Pop. (1871) of burgh, 1408; of parish, 2373. The parish includes the Bass Rock, North Berwick Law, and the ruins of Tantallon castle. The castle is graphically described in Scott's *Marmion*. It is an irregular pile, 2 m. e. of the t., on a high rock, surrounded by the sea on three sides, with a ditch on the land-side, where there was formerly a draw-bridge. It was a stronghold of the Douglas family. N. Berwick Law is a conical hill of an elevation of 940 ft., on the s., close to the town.

BERWICK-ON-TWEED, a seaport t. at the mouth of the Tweed, 58 m. s.s.e. from Edinburgh. It is the frontier town of England and Scotland, and with its liberties, comprising an area of about 8 m., forms an independent borough and county by itself separate from England and Scotland; and since the municipal reform act of 1835, its proper designation is "county of the borough and town of Berwick-upon-Tweed." It has its own quarter sessions and recorder, its own magistrates and petty sessions, and maintains its own police staff. The municipal and parliamentary boroughs are co-extensive. Pop. '71, 13,283, an increase since 1861 of 17; inhabited houses, 2092, increase, 209; constituency, 1148, returning two members of parliament. The past history of B. is full of interest, especially in regard to the border wars. The authentic records of B. begin in the reign of Alexander I., 12th c., when it was one of the principal seaports in the kingdom. B. finally passed into the possession of England in 1482. The town has an antiquated and somewhat decaying appearance. It is girded with old fortifications, and has large barracks. Tweedmouth and Spittal (the latter a favorite watering-place), on the s. side of the Tweed, both within the municipality of B., are reached by an old stone bridge, and a magnificent viaduct of 28 arches spans the river, and connects the North-eastern with the North British railway. The shipping belonging to the port in 1875 was 25, tonnage, 1459, besides 576 fishing-boats. The harbor commissioners resolved, with a view of resuscitating the trade of the port, to construct a wet dock, at a cost of £40,000; this undertaking, commenced in 1873, is now completed. Of recent years the salmon fishings have improved, but the herring fishing has declined. For the manufacture of agricultural implements B. stands high, and in Spittal there are several large artificial-manure works. It has 20 places of worship, 4 belonging to church of England, 3 to church of Scotland, 4 Eng. Presbyterian, 4 U. P., and 5 of other denominations; 14 day-schools, including corporation's academy. Public institutions include infirmary and dispensary, museum, literary institute, and subscription library. Besides several new ecclesiastical edifices and schools erected of late years, a freemasons' hall, a good templars' hall, and a mission hall were built in 1873.

BERWICKSHIRE, a maritime and border co. in the s.e. extremity of Scotland, is bounded n. by Haddington; s. and s.e. by Roxburgh and Northumberland, having a detached portion of Durham on its s.e. limits; e. by the German ocean and Berwick-on-Tweed; and w. by Mid-Lothian and Roxburgh. It extends from e. to w. 35 m., from n. to s. 22 m., and has an area of 464 sq.m., or 297,161 statute acres. B. is divided into

three districts—the Merse, the Lammermoors, and Lauderdale. The largest and most fertile district is the luxuriant valley of the Merse, believed to be the most extensive and richest piece of level land in Scotland, extending to nearly 130,000 acres. The Lammermoors, consisting of 90,000 acres, chiefly pastoral, divide the valley of the Tweed from Mid-Lothian and Haddington. Lauderdale, in extent about 67,000 acres, comprising a mixture of hill and dale, runs along the banks of the Leader Water. From its commencement at Lamberton to St. Abb's head, the coast line of B. extends to 8¼ miles, or allowing for headlands, 9¼. The coast is rocky and bold, with only two bays, at Eyemouth and Coldingham respectively. Geologically, as well as topographically, B. possesses numerous interesting features—the Lammermoors (the principal summits of which are Lammer Law, Crib Law, Sayer's Law, and Clint hill, ranging from 1500 to 1600 ft. high), consist of Silurian strata, stretching to St. Abb's head; in the s., carboniferous rocks are found, while an extensive bed of red sandstone extends easterly from the center of the county to the sea-coast. On the coast porphyry is found, and some traps and syenite in the interior. Ironstone and thin seams of coal occur, as well as gypsum, clay, and shell-marl. The Blackadder, Whitadder, and Leader streams, the river Eye being the only exception, are tributaries of the Tweed. Pop. '71, 36,486; parishes, 31; inhabited houses, 6491; constituency (1878), 1757; 55 day-schools, with 5833 scholars, under the jurisdiction of school-boards, and about 30 independent schools, attended by nearly 2000 children; 68 places of worship (32 established, 16 free, 17 U. P., and 3 of other denominations). B. returns one member to parliament. Agriculturally, B. occupies a prominent position, and the science of agriculture has in this county found great development. In 1875, 192,480 statute acres were farmed by 983 tenants or owners. B. is, however, almost entirely barren of hives of manufacturing industry. The principal towns are Dunse, the most populous, the birthplace of Thomas Boston, Dr. M'Crie, and, as some contend, of Duns Scotus; Greenlaw, the county town; Lauder, a royal burgh; Eyemouth, a prosperous fishing station; Coldstream, where gen. Monk first raised the Coldstream guards; Ayton; and Earlston, the Ercildoune of Thomas the Rhymer. Dunse being more central than Greenlaw, the great bulk of the county business has been transferred thither. Many names famous in Scottish annals are closely associated with B.; amongst others, ancestors of the royal Stuarts; the noble family of Douglas; the earl of Bothwell, who was sheriff of B.; the brave but unfortunate son of James II., styled duke of B.; the great Marlborough (baron Eyemouth); and the records of the court of session show that no fewer than 23 judges were natives of B. The antiquities of the county are few, the chief being the ruins of Dryburgh abbey, Coldingham priory, Fast castle, and the remains of British and Roman camps, and barrows.

BER'YL, a mineral which scarcely differs except in color from emerald (q.v.), never exhibiting the bright rich green which characterizes that gem, but colorless, yellowish, greenish-yellow, or blue. The finer varieties, which are transparent and of beautiful color, are distinguished as *precious B.*, and are sometimes called *aquamarine*. These occur in crystals similar in form to those of emerald; but the regular hexagonal prism is more frequently modified by truncation on the angles or edges, acumination, etc. The prisms are often long. Their sides are longitudinally striated, often deeply so; but the truncating or terminating planes are smooth. The coarser varieties of B. (*common B.*) are also found crystallized, but often massive. B. occurs chiefly in veins that traverse granite or gneiss, or imbedded in granite; sometimes it is found in alluvial soils formed from such rocks. Common B. is found in a number of places in Europe; Rubislaw, near Aberdeen, is a British locality. The mountains of Aberdeenshire, and those of Mourne in Ireland, yield precious B., which is also found in several parts of the continent of Europe and of New England, but principally in Brazil and Siberia. It is much valued as a precious stone, although not so much as the emerald.

BERZELI"S, Johann Jacob, Baron, one of the greatest of recent chemists, was b. at Westerlösa, in e. Gothland, Sweden, 20th Aug., 1779. While studying for the medical profession at the university of Upsala, he was more attracted by the preparatory natural sciences, especially chemistry. After being some time employed in medical practice and lecturing, he was appointed (1806) lecturer on chemistry in the military academy of Stockholm, and, in the following year, professor of medicine and pharmacy. He was shortly after chosen president of the Stockholm academy of sciences; and from 1818 till his death, 7th Aug., 1848, held the office of perpetual secretary. The king raised him to the rank of baron; other honors from learned societies were conferred on him; and the directors of the Swedish ironworks, in consideration of the value of his researches in their particular branch of industry, bestowed on him a pension for life. In 1838, he was made a senator; but he took little part in politics. The field of his activity lay in his laboratory, where he acquired a name of which his country is justly proud. His services to chemistry are too vast to be described here. The science of chemistry, as at present organized, rests in a great measure upon the discoveries and views of B., although in not a few points he has been controverted, or found wrong. His multiplied and accurate analyses established the laws of combination on an incontrovertible basis; and to him we owe the system of chemical symbols. He discovered the elements selenium and thorium, and first exhibited calcium, barium, strontium, columbium or tantalum, silicium, and zirconium, in the metallic form. The blowpipe in the hands of B. became a powerful

instrument in the analysis of inorganic substances. The multitude and accuracy of his researches in every branch of chemical inquiry make it difficult to conceive how one man could have accomplished so much. Of his numerous writings, the most important is his *Lärebok i Kemien* (text-book of chemistry, 3 vols., Stock. 1808–18), which has since passed through 5 large editions, on each occasion being almost wholly rewritten. The best known edition is that published in 8 vols. at Brussels in 1835. The book has been translated into every European language. His essay *On the Use of the Blowpipe* exhausts the subject, while his *Annual Reports on the Progress of Physics, Chemistry, and Mineralogy*, undertaken at the request of the academy of sciences in 1822, have proved very valuable to science. Scarcely less so have been the *Memoirs Relative to Physics, Chemistry, and Mineralogy*, of which he was one of the originators and conductors, and to which, during the 12 years they were published, from 1806 to 1818, he contributed 47 original papers.

BESANÇON (*Vesontio*), capital of the French department of Doubs, and formerly capital of Franche-Comté, is situated on the river Doubs, which divides it into two parts, about 45 m. e. of Dijon, Lat. 47° 14′ n., long. 6° 3′ east. It was strongly but irregularly fortified by Vauban, the citadel being considered impregnable. Since that time, the fortifications have been extended and strengthened, and B. is now considered one of the strongest military positions in Europe. It was the ancient Vesontio, Besontium or Visontium, and was a considerable place even in the time of Cæsar, who, in 58 B.C., expelled from Vesontio the Sequani, and, in the neighborhood of the city, gained a victory over Ariovistus. It then became an important Roman military station. In modern times, after undergoing many changes, it finally came into the possession of France in 1674. Several streets and places in B. still bear old Roman names; and in the neighborhood are found ruins of a triumphal arch of Aurelianus, an aqueduct, an amphitheater, and a theater which must have been large enough to contain 20,000 spectators. Among the modern structures, the cathedral and the churches of St. John and the Magdalen, with the prefecture and the half-Gothic, half-Roman palace of cardinal Granvella, are most remarkable. B. has considerable manufactures, chiefly watches (of which more than 300,000 are made annually), porcelain, carpets, iron-wire, and beer, and is an important entrepôt for the produce of part of Switzerland and the s. of France. 600,000 bottles of Seltzer-water are annually manufactured. Pop. '76, 42,808.

BESANTS', or **BEZANTS'**, circular pieces of bullion, generally gold, without any impression, supposed to represent the old coinage of Byzantium, brought home by the crusaders, and hence of frequent occurrence as heraldic charges. B. are generally introduced into the arms of banks, and also into those of individuals who have been specially connected with money. Similar figures, when not colored *or* (gold), or *argent* (silver), are known in heraldry by the general term of *roundels*. A *bezanty cross*, is a cross composed of B.; and *bezanty* or *bezantée*, is the term used when the shield, or any particular charge, is strewed with besants.

BESIEGING. See SIEGE.

BESSARA'BIA, a government in the s.w. of Russia, on the Roumanian frontier. The area, enlarged by the restoration in 1878 of the portion ceded to Moldavia in 1856, is about 18,000 sq.m.; the pop., now nearly 1,400,000, is composed of Russians, Poles, Wallachians, Moldavians, Bulgarians, Greeks, Armenians, Jews, Germans, and Tartars, with a sprinkling of gypsies. The Dniester flows along the whole of its northern and eastern boundaries; the Pruth separates it from Moldavia on the w.; and it has the Danube on the south. B. is also intersected by several considerable streams; which are, however, much reduced by the summer heats. The climate is, on the whole, mild and salubrious. In the n.w., the country is traversed by well-wooded offshoots of the Carpathian mountains. Generally, however, B. is flat and fertile, but for want of proper cultivation the land does not yield the rich returns it is capable of doing. Wheat, barley, and millet are raised to some extent, as well as hemp, flax, tobacco, fruit, and wine; but the breeding of cattle forms the chief business of the inhabitants. Salt, cattle, wool, and tallow are exported; leather, soap, and candles are manufactured. B., which fell under the power of the Turks in 1503, suffered heavily in all wars with Russia, and was ceded to Russia in 1812. By the treaty of Paris, the portions of B. lying along the Pruth and the Danube—about 4000 sq.m., with some 200,000 inhabitants—were assigned to Moldavia; at the Berlin congress of 1878, this region was again transferred to Russia.

BESSA'RION, JOHANNES, or BASILIUS, b. at Trebizond, on the Black sea, 1395, is remembered as one of the earliest of those scholars who, in the 15th c., transplanted Greek literature and philosophy into the west, and rescued the mind of Christendom from the trammels of scholasticism. B. imbibed his love of Plato's writings from his tutor, Gemistus Pletho. As bishop of Nicæa, B. accompanied the Greek emperor, John Palæologus, to Italy; and effected, at the council of Florence in 1439, a union between the Greek and the Romish churches, which, however, was of short duration. Soon afterwards he joined the Romish church, but always retained a glowing love of his native land. He was made cardinal by pope Eugene IV. in 1439. Ten years after, Nicholas V. created him cardinal-bishop of Sabina, and in the same year bishop of Frascati. For five years, also, he discharged the duties of papal legate at Bologna.

After the fall of Constantinople, B. visited Germany; and at the diets of Nuremberg, Worms, and Vienna, endeavored to promote a crusade against the Turks. In philosophy, he professed to be a follower of Plato, but without depreciation of Aristotle. His writings, consisting of Latin translations of Greek authors, defensive treatises on the Platonic philosophy, with discourses and letters, have never been published collectively. Twice he was nearly elected pope; but his partiality for the heathen philosophy was probably regarded as some disqualification by the sacred college. B. died at Ravenna, Nov. 19, 1472, leaving his collection of 600 valuable Greek MSS. to the St. Mark's library, Venice.

BESSÈGES, an industrious and thriving t. of France, in the n. of the dep. of Gard, 11 m. n. from Alais. It is situated on the river Ceze. A railway connects B. with Alais. There are extensive coal-mines in the neighborhood. Pop. '76, 7953.

BESSEL, FRIEDRICH WILHELM, one of the most distinguished of modern astronomers, was b. at Minden, July 22, 1784. In 1806, he was, on the recommendation of Olbers, whom he had greatly assisted by his remarkable expertness in calculation, appointed assistant to Schröter at Lilienthal. In 1810, he published his researches on the orbit of the great comet of 1807, which gained for him the Lalande prize of the Paris academy of sciences. In the same year he was appointed director of the new observatory to be erected by the king of Prussia at Königsberg; and repairing thither immediately, superintended the erection and the mounting of the instruments. The establishment was completed in three years. In 1818, B. published his *Fundamenta Astronomiæ* —giving the results of Bradley's Greenwich observations—a work upon which he had been engaged for eleven years. This work is one of the highest value to astronomers. It is described by a competent authority as having laid the foundations of the principal improvements which have been made in astronomy since the date of its publication. In 1830 appeared his *Tabulæ Regiomontanæ*, forming a kind of supplement to the above work. Besides numerous papers of an important character (nearly 200 in all) scattered through various scientific journals, he also published an inquiry on the *seconds' pendulum* for Berlin (1828, and again in 1837), *Astronomical Researches* (2 vols., Königsb. 1841–42). His paper on the precession of the equinoxes gained him the prize of the Berlin academy. After a series of three years' observations he succeeded in determining the annual parallax of the fixed star 61 Cygni (see STARS), an achievement honorable not only as the first of its kind, but for the marvelous skill and patience necessary for its accomplishment. In the years 1824–33, B. made a series of 75,011 observations in 536 sittings, and completed a catalogue of stars (extending to the ninth magnitude) within the zone from 15° n. to 15° s. declination. These were afterwards reduced by Weisse. In one of his lectures, delivered at Königsberg in 1840, B. indicated the existence of the new planet afterwards discovered by Le Verrier, and named Neptune; and but for the death of a favorite son, he in all probability would have undertaken the investigation of the problem. B.'s *Popular Lectures on Astronomy*, given at Königsberg, 1832–44, were edited by his friend Schumacher, and published at Hamburg in 1848, two years after his death, which took place Mar. 7, 1846. All scientific associations, both on the continent and in England, were eager to confer honor on themselves by enrolling B. as one of their members. He was a thoroughly practical man of science, never allowing himself to be carried away by any theory, however inviting, and particularly remarkable for the precision of his calculations, being satisfied with nothing less than perfect exactness.

BESSEMER, HENRY, b. England, 1813; an engineer, and inventor of many machines and improvements, particularly in reference to the manufacture and use of the metal known as Bessemer steel. (See BESSEMER PROCESS, *ante.*) One of his latest inventions is the "Bessemer saloon" for the avoidance of sea-sickness, which proved to be a failure. Prizes and other honors have been conferred on B. by a number of governments and societies.

BESSEMER PROCESS FOR MAKING STEEL. The boldest and most noted attempt which has yet been made to improve on the older methods of making both malleable iron and steel, is that of Mr. Henry Bessemer, whose process was patented in 1856. Bessemer's first idea was to blow air through molten cast-iron till the whole of the carbon was oxidized when malleable iron was required, and to stop the blowing when a sufficient degree of decarburization was effected in order to produce steel. He has hitherto failed to produce malleable iron of the least service by his process, so that, as a metallurgical operation, it is at present confined to the manufacture of steel. But neither can serviceable steel be made by the plan first specified by Bessemer, except from the best charcoal iron, such as the Swedish. In England, where charcoal iron is not used for this purpose, the process can only be successfully conducted by first oxidizing the whole of the carbon and silicon, and then restoring the proper amount of carbon by the addition of a small quantity of a peculiar cast-iron of known composition, called *spiegeleisen*. Moreover, hematite pig is the only kind of English iron which can be employed, as that made from clay iron-stone contains too much phosphorus and sulphur. The getting rid of these two elements and silicon is the most formidable difficulty which the steel-manufacturer has to encounter.

The various steps in the Bessemer process, as at present conducted, are as follows: Pig-iron is melted either in a cupola or reverberatory furnace, and run in the liquid state into a converting vessel. This converter, or "kettle," as it is called in Sheffield, is of wrought-iron, lined either with fire-brick or with a siliceous material called "ganister," and is suspended on trunnions, so as to admit of its being turned from an upright to a horizontal position by means of hydraulic apparatus. The capacity of a converter varies from three to ten tons. In the bottom there are seven tuyères, each with seven holes of one half inch in diameter, through which atmospheric air is blown with a pressure of 15 to 20 lbs. per sq. inch by a blowing-engine. The molten iron in the converter is therefore resting, from the first, on a bed of air, the strength of the blast being sufficient to keep it from falling through the tuyères into the blast way. During the blowing off of the carbon at this stage, a striking and magnificent effect is produced by the roar of the blast, and the volcano-like shower of sparks and red-hot fragments from the mouth of the converter, as well as by the dazzling splendor of the flame. In about 15 or 20 minutes, the whole of the carbon is dissipated. The first "blow" being over, the converter is lowered to a horizontal position, and presently a red stream of molten spiegeleisen is run into its mouth, till it amounts to from 5 to 10 per cent of the whole charge. As already stated, the spiegeleisen restores the proper amount of carbon to produce steel; and after it is added, the blast is again turned on for a few minutes to secure its thorough incorporation. There is a circular pit in front of every two converters, with a hydraulic piston in its center, and on its counterpoised arm a large ladle is hung, so that it can sweep the whole circumference. Round this the ingot molds are arranged, and the hydraulic machinery is so conveniently planned that, simply by moving levers, a man standing on a small platform can empty the contents of the huge converters into the ladle, raise or lower the ladle itself, and turn it round from point to point, so as to fill the molds by means of a plug in its bottom. Steel made in this way is not sufficiently dense, and accordingly the molds are lifted off the ingots by means of a hydraulic crane, and the latter removed while still hot, and condensed under heavy steam-hammers. After this, they are rolled into rails, tires, plates, and other heavy objects, for which this steel is suitable. Although, as already said, Bessemer steel will not do for tools and cutting instruments, nor even for such comparatively coarse objects as the springs of railway wagons, yet the great value of the invention is unmistakably shown by the fact that 500,000 tons of steel are now annually made by this process in Great Britain, the total number of converting vessels in use being 91, and their aggregate capacity 467 tons. Large quantities are also manufactured by it in Sweden, Russia, Austria, Prussia, Belgium, and France. It is likewise extensively employed in America. In an experimental trial, said to be quite fairly conducted, a Bessemer steel rail lasted fully longer than 20 iron ones. See IRON.

BESSEMER STEEL. (BESSEMER PROCESS FOR MAKING STEEL, *ante.*) The product of Bessemer steel in the United States, in 1879, was 829,429 gross tons; in England, in the same year, 834,711 tons. In this manufacture the English used 66 converters, the Americans 22. The capacity of American mills for the production of this metal may be learned from the following table:

BESSEMER STEEL MILLS IN THE UNITED STATES, Jan. 1, 1880.

NAME.	PLACE.	WHEN OPENED.	CONVERTERS.	
			No.	Tons.
Albany and Rensselaer Iron and Steel Co	Troy, N. Y.	Feb., 1865.	2	7
Pennsylvania Steel Works	Baldwin Sta., Pa.	June, 1867.	2	6½
Cleveland Rolling Mills	Cleveland, O.	Oct., 1868.	2	6
Cambria Iron Co	Johnstown, Pa.	July, 1871.	2	5
Union Rolling Mills	Chicago, Ill.	July, 1871.	2	6
North Chicago Rolling Mills	Chicago, Ill.	April, 1872.	2	6
Joliet Iron and Steel Works	Joliet, Ill.	March, 1873.	2	6¾
Bethlehem Steel Works	Bethlehem, Pa.	Oct., 1873.	2	7
Edgar Thompson Steel Works	Pittsburg, Pa.	Sept., 1875.	2	7
Lackawanna Steel Works	Scranton, Pa.	Oct., 1875.	2	5
Vulcan Steel Works	St. Louis, Mo.	Sept., 1876.	2	7

Total number of mills, 11; of converters, 22; capacity of converters, 69½ tons.

BESSENO'VA, a small t. of the Austrian empire, in s. Hungary, on the n. bank of the Aranka, 8 m. w.s.w. from St. Miklos. Pop. 7896.

BESSIÈRES, JEAN BAPTISTE, Duke of Istria, and marshal of the French empire, was born at Preissac, in the department of Lot, Aug., 1768. After serving for a short time in the constitutional guard of Louis XVI., in Nov., 1792, he entered the army of the Pyrenees as a private soldier. In less than two years, he had attained the rank of captain, and passing into the army of Italy, he distinguished himself greatly in the battles of Roveredo and Rivoli. Having been made chief of a brigade in 1798, he in that year accompanied Bonaparte to Egypt, and made himself conspicuous at the siege of St. Jean

d'Acre, and at the battle of Aboukir. Afterwards he took a prominent part in the battles of Marengo, Olmütz, Austerlitz, Jena, Friedland, and Eylau; and within five years (from 1800 to 1805), he was made successively general of brigade, general of division, and marshal of France. For his gallant behavior in Spain, he was, in 1809, created duke of Istria. In the Russian campaign, he commanded the cavalry of the guard, and during the disastrous retreat from Moscow, the services he rendered were of the utmost importance. In 1813, he received the command of the whole of the French cavalry. On the morning of the battle of Lützen, while leading on foot the *tirailleurs* to reconnoiter the field from the defile of Rippach, he fell mortally wounded by a bullet. The news of his death was kept concealed from the army throughout the day. Bonaparte lost in B. one of his ablest officers, and his most faithful friend.

BESTIAIRES (Fr.), the name given to a class of written books of great popularity in the middle ages, describing all the animals of creation, real or fabled, and generally illustrated by drawings. They were most in fashion during the 11th, 12th, and 13th centuries. They served as encyclopædias of the zoology of those ages, but they had also another use. The symbolism which was then so much in vogue fastened spiritual meanings upon the several animals, until every quality of good or evil in the soul of man had its type in the brute world. It is in this way to the *B.* that we must look for explanation of the strange, grotesque creatures which are found sculptured on the churches and other buildings of the middle ages. There were B. both in prose and in verse, in Latin and in the vernacular. A few sentences from *Le Bestiaire Divin de Guillaume, Clerc de Normandie, Trouvère du XIII^e Siècle* (Caen, 1852), may help to give some notion of the class of works of which it is a fair example. "The unicorn," he writes, "has but one horn in the middle of its forehead. It is the only animal that ventures to attack the elephant; and so sharp is the nail of its foot, that with one blow it rips up the belly of that most terrible of all beasts. The hunters can catch the unicorn only by placing a young virgin in the forest which it haunts. No sooner does this marvelous animal descry the damsel, than it runs towards her, lies down at her feet, and so suffers itself to be taken by the hunters. The unicorn represents our Lord Jesus Christ, who, taking our humanity upon him in the virgin's womb, was betrayed by the wicked Jews, and delivered into the hands of Pilate. Its one horn signifies the gospel truth, that Christ is one with the Father," etc.

BESTUSCHEW, ALEXANDER, a Russian novelist, born about 1795, was captain in a dragoon regiment, and adjutant to Alexander, duke of Würtemberg. Having been involved with his friend Rylejew in the conspiracy of 1825, he was degraded to the ranks, and exiled to Yakutzk, but after long entreaty, permitted to enter the army of the Caucasus as a private in 1830. In June, 1837, he fell in a skirmish with the as yet unconquered mountaineers. Two years before his exile he, together with his friend Rylejew, who was executed in 1825, had published the first Russian almanac, *The Pole Star.* His later works, consisting chiefly of novels and sketches, written under the name of Cossack Marlinski, bore the impress of his own life and adventures in the Caucasus. They excel in depicting the wilder aspects of nature, and the excitements of a soldier's life, but fail in the delineation of character, and are often exaggerated, and sometimes absurd. His principal works are the tale of *Mullah Nur,* and the romance of *Ammalath Beg,* which last relates the treachery of a Circassian chief, and gives interesting pictures of the scenery of the Caucasus. Several of his novels were translated into German by Seebach (Leipsic, 1837), and his collective works appeared at St. Petersburg in 1840, under the name of *Marlinski's Tales.* His three brothers were implicated in the military conspiracy of 1825, and hanged by the special order of the emperor.

BETANZOS (anciently *Brigantium Flavium*), a t. of Spain, province of Corunna, 10 m. s.e. of the city of the same name. Ancient granite gateways still defend its narrow streets. It has manufactures of linen, leather, and earthenware. Pop. between 4000 and 5000.

BE'TEL, BE'TLE, or PAWN, a narcotic stimulant much used in the east, and particularly by all the tribes of the Malay race. It consists of a leaf of one or other of certain species of pepper, to which the name of betel-pepper is indiscriminately applied, plucked green, spread over with moistened quicklime (*chunam*) generally procured by calcination of shells, and wrapped around a few scrapings of the areca nut (see ARECA), sometimes called the betel-nut, and also known as *pinang.* This is put into the mouth and chewed. It causes giddiness in persons unaccustomed to it, excoriates the mouth, and deadens for a time the sense of taste. It is so burning that Europeans do not readily become habituated to it, but the consumption in the East Indies is prodigious. Men and women, young and old, indulge in it from morning to night. The use of it is so general as to have become a matter of etiquette; a Malay scarcely goes out without his betel-box, which one presents to another as Europeans do their snuff-boxes. The chewing of B. is a practice of great antiquity, and can certainly be traced back to at least the 5th c. B.C. It gives a red color to the saliva, so that the lips and teeth appear covered with blood; the lips and teeth are also blackened by its habitual use, and the teeth are destroyed, so that men of twenty-five years of age are often quite toothless. Whether the use of B. is to be regarded as having any advantages except the mere pleasure afforded to those who have acquired the habit of it, to counterbalance its obvious disad-

vantages, is a question upon which difference of opinion subsists. Some have represented it as beneficially promoting the secretion of saliva, strengthening the digestive powers, and warding off the attacks of fever; whilst others pronounce against it an unqualified condemnation. Sir James Emerson Tennent, in his valuable and interesting work on Ceylon, expresses the opinion that it is advantageous to a people of whose ordinary food flesh forms no part, and that it is at once the antacid, the tonic, and the carminative which they require.

The name B. is often given to the species of pepper of which the leaves are ordinarily chewed in the manner just described, which are also called B. PEPPER or PAWN. Some of them are very extensively cultivated, particularly *chevica betle*, *C. siraboa*, and *C. malamiri*, climbing shrubs with leathery leaves, which are heart-shaped in the first and second of these species, and oblong in the third. They are trained to poles, trellises, or the stems of palms, and require much heat with moisture and shade; upon which account, in the n. of India, where the climate would not otherwise be suitable, they are cultivated with great attention in low sheds, poles being placed for their support at a few feet apart. Hooker mentions, in his *Himalayan Journal*, that these sheds are much infested by dangerous snakes, and that lives are therefore not unfrequently lost in the cultivation of betel.—The genus *chevica* is one of those into which the old genus *piper* (see PEPPER) has recently been divided. The requisite qualities of B. are probably found in the leaves of numerous species not only of this but of other genera of the same family. The leaf of the ava (q.v.) is sometimes used.

BETH (*Heb.* "house"), used in the Old Testament as a part of the name of places, as "Beth-el," house of God; "Beth-aram," house of the height; "Beth-esda," house of mercy, etc.

BETHANY, a village in West Virginia, 10 m. e. of Wheeling. Bethany college was founded in 1841 by Rev. Alexander Campbell, the head of the sect of Baptists calling themselves "Disciples of Christ," and by the world at large known as "Campbellites." At last report the college has six professors and instructors and 105 students; W. K. Pendleton, LL.D., is the president.

BETHANY, meaning a "boat-house;" called "Lazariyeh," or "town of Lazarus," by the natives of Palestine, in reference to the event narrated in Scripture. It is a retired spot, beautifully situated on the southern slope of the Mt. of Olives, 3 m. from Jerusalem, with a pop. of about 500, principally Latins. There is nothing remarkable about the village except some ruins, among which are some which are said to have been the house of Martha and Mary, and the cave or grave of Lazarus, the descent into which is effected by 26 steps cut in the solid rock, leading to a small chamber, about 5 ft. square, also excavated. The appearance of the cave certainly corresponds with what is said about it in Scripture—"It was a cave, and a stone lay upon it" (St. John xi. 38). Near to the cave are the ruins of a fort built by queen Melisinda in 1132, to protect the nunnery founded by her in honor of Martha and Mary.

BETHEL, a t. in Oxford co., Me., 70 m. n.n.w. of Portland, noted for attractive scenery of mountains and water-falls; among the more conspicuous are Glass Face and White Cap mountains, and Partridge, Rumford, and Screw Auger falls. The White mountains, 25 m. away, can be seen from the town.

BETHEL, called Betein by the natives, about 10 m. from Jerusalem, mentioned in Scripture as the scene of Jacob's dream. Here also Abraham pitched his tent. Now a heap of ruins, almost entirely deserted, or only inhabited by a few straggling Arabs.

BETHELL, the Right Hon. RICHARD, Baron WESTBURY, an eminent lawyer, b. at Bradford, Wiltshire, in 1800, son of a physician at Bristol. From Bristol grammar-school, he went, at the age of 14, to Wadham college, Oxford, where he was first class in classics, and second class in mathematics, and took his degree of B.A. at the early age of 18. After being a private tutor at Oxford, he studied law, and was called to the bar at the middle temple in Nov., 1823. In 1840, he was made a queen's counsel. Elected, in April, 1851, M.P. for Aylesbury, on the formation of the Aberdeen ministry in Dec., 1852, he was made solicitor-general, and shortly after knighted. From Nov., 1856, to Mar., 1858, he was attorney-general. In 1861, he was made lord chancellor, and at the same time raised to the peerage. He resigned the great seal, however, in 1865, and on July 20, 1873, he died. B. was conspicuous for his exertions in the cause of law reform, in improving the system of education for the bar, and in abolishing the ecclesiastical courts, etc.

BETHESDA, POOL OF, meaning "house of pity." The scene of Christ's cure of the impotent man (St. John v. 2–9), and resort of the "impotent, blind, halt, and withered," once filled with water, "which an angel went down at certain seasons and troubled," is now dry and used as a deposit for dirt and rubbish. It is situated within the gates of Jerusalem, near the St. Stephen's gate and the temple of Omar; measures 460 ft. in length, by 130 in breadth, and 75 in depth.

BETH-HORON ("house of the hollow"), two villages of Palestine, 9 to 12 m. from Jerusalem, upper and lower; built by Sherah, a woman of Ephraim. Joshua drove the five kings of the Amorites down the pass of the lower Beth-Horon, and Solomon fortified both places. From Jerome's time until the beginning of the 19th c. the towers seem to

have been unnoticed. The present villagers are known as "Upper" and "Lower Beit-ur."

BETHLEHEM, a village in Grafton co., N. H., much frequented by visitors to the White mountains; 5 m. from Littleton; pop. '80, 1,200. Its situation is high, commanding beautiful views; and its atmosphere is found beneficial to sufferers with "hay-fever."

BETH'LEHEM, is the name of the chief settlement of Moravians in Pennsylvania, United States.

BETHLEHEM (*ante*), a village in Pennsylvania, on the Lehigh river, at the terminus of the North Pennsylvania railroad, 51 m. n. of Philadelphia; founded by Moravians in 1741; pop. '80, 5195. It is a place of summer resort, and noted for manufactories of iron and zinc. The Moravians (United Brethren) have a fine church, a seminary for women, and other educational and benevolent institutions. In 1866, the Lehigh (Episcopal) university was established in South Bethlehem, chiefly through the generosity of Asa Packer, who gave it 56 acres of land and half a million of dollars. In 1878, there were 14 professors and instructors, and 113 students; John M. Leavitt, D.D., president.

BETH'LEHEM, or BEIT-LAHAM, meaning "house of bread," celebrated in Scripture as the birthplace of our blessed Saviour, and of king David, is now a small unwalled village, situated at a distance 5 m. s. of Jerusalem. The pop., about 3000 souls, is wholly Christian—that is, Latin, Greek, and Armenian. The village is situated in the center of a most interesting country; and the roof of the Latin monastery—the only public building of any importance, inclosing the cave which is the alleged place of our Lord's nativity—commands a beautiful and extensive view of the surrounding country: in the distance, e., are the mountains of Moab and the plains of the Jordan; s., stands the hill of Tekoah, familiar as the scene of the pastoral life of the prophet Amos; beyond, and rather more to the e., lies the wilderness of Engedi, to which David retreated for the purpose of concealing himself against the pursuit of Saul, and where the allied armies of the Amorites, Moabites, and others, encamped when they came forth against Jehoshaphat; n., is the road to Jerusalem, with the mountains of Judea and Rachel's tomb. The convent of the Nativity, which incloses the supposed manger, etc., is a large square building, more resembling a fortress than the quiet habitation of the recluse, was built by the empress Helena, 327 A.D., but destroyed by the Moslems in 1236, and, it is supposed, restored by the crusaders. Within it is the church of the Nativity, which, like and in connection with the church of the Holy Sepulchre at Jerusalem, is subdivided among the Latins, Greeks, and Armenians, each community having a separate portion of the edifice for devotional purposes. The church is built in the form of a cross; the nave, which is by far the finest part of the building, belongs to the Armenians, and is supported by 48 beautiful Corinthian columns of solid granite, each between 2 and 3 ft. in thickness, and about 17 in height. The other portions of the church, forming the arms of the cross, are walled up. At the further end of that section, which forms the head of the cross, and on the threshold, is a sculptured marble star, which the Bethlehemites say covers the central point of the earth! Here a long intricate passage descends to the crypt below, where the blessed virgin is said to have been delivered. The walls of the chamber are hung with draperies of the gayest colors; and a silver star, with the words, "*Hic de virgine Maria Jesus Christus natus est,*" marks the spot of the nativity. The manger stands in a low recess cut in the rock, a few feet from this star.

The other objects of interest in the church are the chapel and tomb of St. Jerome, who became a monk of this convent towards the end of the 4th c.; the chapel and tomb of Santa Paula, a Roman lady, and the founder of several nunneries at Bethlehem; the tomb of St. Eudosia; and the pit into which it is supposed the bodies of the murdered innocents were cast. B. is under the jurisdiction of the pasha of Jerusalem. The Bethlehemites chiefly gain their subsistence by the manufacture and sale of crucifixes, beads, boxes, shells, etc., of mother-of-pearl and olive-wood. Much wine is made at B., which is considered all over Palestine next best to the Lebanon wine.

BETHLEHE'MITES, or BETHLEHEMITE BROTHERS, the name of an order of monks at Cambridge in the 13th c.; also of an order founded in Guatemala, 1673. The followers of Jerome Huss were styled B., from Bethlehem church in Prague, where their leader preached.

BETHLEN-GABOR (or, as he would be called in western Europe, GABRIEL BETHLEHEM or BETHLEN, it being a common custom in Hungary and Transylvania to make the baptismal follow the family name) was descended from an ancient and distinguished Protestant family of upper Hungary, which also possessed important estates in Transylvania, and was born in 1580. He rose to prominence during the troubles which distracted the principality in the reign of the two Bathories, Sigismund and Gabriel; and on the death of the latter of these unfortunate princes, succeeded (1613), by the aid of the sultan, in being chosen sovereign prince of Transylvania, the house of Austria being at that time in no condition to offer effective opposition. In 1619, when the Bohemians rose in defense of their religious and political rights, they looked eagerly for support to B., who had already gained a wide reputation as a warrior and a champion of Protest-

antism; and the Transylvanian prince, too glad of such an opportunity to gratify his ambition at the expense of his enemy, Austria, eagerly proffered his support. He accordingly marched into Hungary, took Kaschau, his advance more resembling a triumphal procession than a hostile invasion, and on arriving under the walls of Presburg was greeted with every mark of joy by the citizens. With an army now swelled by Hungarian volunteers to nearly 100,000 men, he pursued his route towards Vienna, driving before him the Spaniards under Bucquoy, and the Austrians under Dampierre; and would doubtless have captured the capital had not the severity of the season and the want of provisions, combined with the reinforcement of his opponents, and the defeat of his lieutenant, Ragotski, in Hungary, compelled him to retreat for a time. However, though he retired as far as Kaschau, he did not relinquish his hold of Hungary, of which, by the assembled diet, he had been crowned king at Presburg, 25th Aug., 1620; but, resuming the offensive, on the defeat and death of Bucquoy, before Neuhausel, he recovered the fortresses which the imperialists had retaken, and spread devastation and terror to the gates of Vienna. His allies, the Protestants of Germany, being apparently crushed, B. concluded peace with Ferdinand II., receiving the town of Kaschau, with seven Hungarian counties adjoining Transylvania, the principalities of Oppeln and Ratibor in Silesia, and the dignity of prince of the empire. This treaty, however, was soon broken by the emperor, who thought so favorably of his own situation as to imagine he could violate his agreement with impunity; but he was soon undeceived, for B., raising an army of 60,000 men, invaded Moravia, obtained the solemn renewal of the former treaty, and then retreated homewards. His marriage with Catharine of Brandenburg in 1625 involved him once more in the thirty years' war; but he finally retired from the contest in the following year, and thenceforth devoted himself exclusively to the internal affairs of Transylvania. He died in 1629, after a lingering and painful illness. B.'s reign was a glorious and flourishing epoch in the history of the little principality; for not only did the great successes achieved through his military talents give a prestige to its arms, but his protection of science and letters, in both of which he was well accomplished, did much to aid the progress of learning. He founded the academy of Weissemburg at Karlsburg, and installed there, as professors, Opitz, Alstedt, Biesterfild, and Piscator.—His brother STEPHEN succeeded him, but was soon compelled to resign the throne.—To the same family of Bethlen belong JOHN and WOLFGANG, both chancellors of Transylvania, the former of whom is celebrated for his work, *Rerum Transylvanicarum, libri iv.* (Hermannstadt, 1683), which gives the history of the principality from 1629 to 1663; and the latter of whom wrote a history in 16 books, the MS. of which, from long neglect, had been much damaged, but which was afterwards restored and completed, and published (6 vols.) at Hermannstadt in 1792, under the title of *Wolfgangi de Bethlen Historia de Rebus Transylvanicis* (1526–1609).

BETHNAL GREEN, an eastern suburb of London, in Middlesex, including Victoria park. Pop. '71, 120,104, many being silk-weavers. It possesses a museum, a branch of the one at s. Kensington.

BETHSAIDA, on the lake of Galilee, metioned in Scripture as the city of Peter and Andrew and Philip, and now a heap of ruins overgrown with grass.

BETHSHEMESH ("house of the sun," or "sun town;" modern name *Ain-esh-Shems*, "fountain of the sun," now distinguishable by neither house nor fountain from which it was likely to derive its name), a ruined city of Palestine, 15 m. w.s.w. of Jerusalem, finely situated on the point of a low ridge, commanding an extensive view of the country, rendered interesting by the exploits of Samson. B. was a sacerdotal city belonging to the tribe of Judah, bordering alike on the possessions of Dan and of the Philistines, and fixed by Eusebius ten Roman miles from Eleutheropolis, on the Nicopolis road. It is interesting as the place where the Ark of the Lord first rested, after the Philistines had sent it back (1 Sam. vi.). One of Solomon's twelve purveyors resided at B., where also was fought the battle between Judah and Israel, in which Jehoash captured Amaziah (2 Kings xiv. 11, 13.). B. was taken by the Philistines during the reign of Ahaz, and from that time disappears from sacred history.

BETHUNE, a t. of France, in the department Pas-de-Calais, situated on a rock overlooking the river Brette, and the canals of Lawe and Aire, 16 m. n.n.w. of Arras. It is strongly fortified, part of the works and the citadel having been constructed by Vauban. It has manufactures of linen and cloth, and a considerable trade in the agricultural produce of the surrounding country. Taken by the French in 1645, it was retaken by the allies in 1710, but was restored to France by the treaty of Utrecht. The first artesian wells are said to have been bored here. Pop. '76, 9315.

BETHUNE, GEORGE WASHINGTON, D.D., 1805-62; b. New York; son of a Scotch merchant and philanthropist; educated at Dickinson college and Princeton theological seminary; in 1828 pastor of a Dutch reformed church at Rhinebeck; then at Utica, N. Y.; and in 1834 in Philadelphia. In 1849 he took charge of a newly formed congregation in Brooklyn; ten years later visited Italy to improve his health; returned to New York and officiated a short time, and in 1861 again went to Italy, where he died suddenly from apoplexy. In literature he was known as the author of *Lays of Love and Faith, Early Lost and Early Saved, The History of a Penitent,* a memoir of his mother,

Anna Graham, *Lectures on the Heidelberg Catechism*, and as editor of *British Female Poets*. His last public effort in his own country was an eloquent speech made at the great union meeting in New York, April 20, 1861. He was noted as an elegant scholar, a fine conversationalist, and a lover of woodland sports.

BE'TICK, or BE'TIK, on the river Oxus, central Asia, "one of the greatest ferries between Persia and Turkestan." Lieut. Burnes, who in 1834 published an account of his travels in central Asia, says the Oxus is here 650 yds. broad and 25 to 29 ft. deep.

BET'JUANS, or BECHUA'NAS, the name of an extensive nation of southern Africa, occupying the country between 23° and 29° e. long., and extending from 28° s. lat. northward beyond the tropic of Capricorn. The B. are generally of a peaceful, indeed cowardly disposition, and are divided into many tribes under the government of chiefs, who exercise a kind of patriarchal authority over them. According to Dr. Livingstone, the different tribes take their names from certain animals, "showing probably that in former times they were addicted to animal worship. The term Bakatla means 'they of the monkey;' Bakuena, 'they of the alligator;' Batápi, 'they of the fish;' each tribe having a superstitious dread of the animal after which it is called. They also use the word 'bina,' to dance, in reference to the custom of thus naming themselves, so that when you wish to ascertain what tribe they belong to, you say, 'What do you dance?' It would seem as if that had been part of the worship of old." Many tribes formerly existing are extinct, as is evident from the names that have now no living representatives. The B. have a vague notion of a supreme being, but no intelligent idea of his attributes. Dr. Livingstone describes the tribe to which he attached himself—the Bakuena or Bakwains—who are favorable specimens of the nation, as generally slow "in coming to a decision on religious subjects; but in questions concerning their worldly affairs they are keenly alive to their own interests." In all agricultural matters they are very acute, exhibiting a wonderful knowledge of the properties of the soil, as well as of the nature and habits of animals. They have a superstitious reverence for a class of imposters calling themselves "rain-doctors," who profess to be able to bring down rain in dry seasons by a certain specific, composed of all kinds of disgusting animal and vegetable substances. One peculiarity of the B. is their inability to build their houses square; all erections take a circular form.

BETLIS. See BITLIS, *ante*.

BETROTHMENT, a mutual engagement by a man and woman with a view to marriage. This anciently consisted in the interchange of rings, kissing, joining hands, and the testimony of witnesses; and the ecclesiastical law punished the violation of such B. by excommunication; but such a spiritual consequence was abolished by the 26 Geo. II. c. 33. A previous B. had also been regarded as a legal impediment to marriage with another. "It was not," says Mr. Macqueen, in his *Treatise on the New Divorce Jurisdiction*, 1858, p. 73, "by the axe that the promoter of the English reformation extinguished his marriage with Anne Boleyn. He first carried her into the ecclesiastical court, and there obtained a sentence, on the ground of her alleged precontract with Northumberland." The aggrieved party, since the 26 Geo. II., has been left to the only remedy of an action for breach of promise. In Scotland there is the same mode of redress consequent on a refusal to proceed to matrimony; but in that country, where the B. or engagement can be shown to have been a clear, free, and deliberate *present consent* on the part of both the man and woman to form the relationship of husband and wife, such a contract may be enforced against the recusant party; and indeed it constitutes marriage itself. See MARRIAGE, PROMISE, HUSBAND AND WIFE.

BETTERTON, THOMAS, a celebrated actor, for about half a century the chief ornament of the English stage, was born in London, 1635, and died there in 1710. The best contemporary judges, such as Addison, Cibber, etc., bear admiring witness to his dramatic powers, which overcame the natural disadvantages of a low voice, small eyes, and an ungainly figure. His private character was highly estimable, cheerful, modest, and generous. After a retirement of many years, it became known that his circumstances were very straightened, and it was determined to give him a public benefit. On the 6th April, 1709, the spirited veteran (then in his 74th year) appeared with immense *éclat* in the youthful part of Valentine in Congreve's *Love for Love*. He acted several times again. Mrs. B. took the same rank among contemporary actresses as her husband did among actors.

BETTING, or WAGERING, is an inveterate practice of the English, which is exemplified in almost all classes of society, but more particularly in relation to horse-racing; bets as to which will be the winning horse at a particular race, being entered into by the highest as well as the lowest of the people. Sanctioned by fashion, betting on horses is carried on to so ruinous an extent in the metropolis that the legislature has interfered to check the evil. The haunts of betters called BETTING-HOUSES are suppressed by the 16 and 17 Vict. c. 119. The act declares them to be a common nuisance, and contrary to law, and prohibits them under very severe penalties. But it provides that its enactments shall not extend to stakes or deposit due to the winner of any race, or lawful sport, game, or exercise. The act was extended to Scotland in 1874. See GAMBLING.

BET'TOLA, a t. of northern Italy, in the province of Piacenza, about 20 m. s.w. of the town of the same name. It is situated on the Nure, in a fertile district. Pop. 5668.

BETULA. See BIRCH.

BETULA'CEÆ, or BETULI'NEÆ. See AMENTACEÆ and BIRCH.

BET'WAH, a river of India, which, after a n.e. course of 340 m., joins the Jumna on the right, about 30 m. to the e.s.e. of Calpee. It rises in the Vindhya mountains, which, uniting the w. and the e. Ghauts at their northern extremities, form the dividing ridge between the basins of the Nerbudda and the Ganges. It runs through beds of iron ore, and waters the towns of Bilcah and Jhansi. The source of the B. is in lat. 23° 14′ n. and long. 77° 22′ e., and its mouth in lat. 25° 57′ and long. 80° 17′. It is described as a very great river, being, even in the dry season, half a mile wide at its junction with the Jumna. It is, however, not navigable in any part of its course.

BEUKELZOON, WILLIAM, a person in humble life, belonging to the small town of Biervliet, in Holland, was the first who succeeded in salting and preserving herrings in a satisfactory manner. This improvement, which is said to have taken place in the year 1336, communicated a great impetus to the industry of the fisheries of Holland. It is related that the emperor, Charles V., made a pilgrimage to the tomb of B., and there ate a herring in expression of his gratitude for the invention. The derivation of *pickle* from B.'s name, also written Beukels, Bökel, etc., is fantastic. B. died in 1397.

BEULÉ, CHARLES ERNEST, 1826–74; a French archæologist and author, educated in the normal school at Paris, and sent to Athens as one of the professors of the school established there in 1852. He discovered the propylæa of the acropolis, and wrote *L'Acropole d'Athènes*, which was published by the French government. Honors came rapidly, and he was soon a member of all important scientific societies, and of the legion of honor. His later years were devoted to politics. Among his works are *Studies in the Péloponnesus*, *The Moneys of Athens*, *History of Sculpture before Phidias*, and *History of Greek Art*.

BEUST, FRIEDRICH FERDINAND FREIHERR VON, German statesman, one of the most prominent modern politicians. His family is of old nobility, distinguished both in the field and the cabinet. B. was b. on 13th Jan., 1809, at Dresden, and after a careful preliminary education in Dresden, he attended the universities of Göttingen and Leipzic. Having conceived early a liking for politics, he devoted himself to diplomacy. After spending some time in travel (1834–35), he served as secretary of embassy, first in Berlin, and then in Paris. In 1838, he represented his government at Munich, where he began to show his diplomatic talents, and soon acquired a certain celebrity. Eight years later, he went to London in the same character, from which he was removed in 1848 to Berlin. When called back to Dresden in 1849, he received the portfolio of foreign affairs. In this office, he declared against the adoption of the new constitution for the German empire, and when thereupon an insurrection broke out in Dresden, he called in the assistance of Prussian military, which speedily crushed it. A few years later, he was made minister of the interior. On the death of Frederick VII. of Denmark (1863), B. came forward prominently as the exponent of the German national feeling on the Slesvig-Holstein question. In the name of his government, he disavowed the London protocol, and urged a policy favorable to the wishes of the duchies, and in harmony with the national feeling of Germany. And, indeed, so prominent and popular did he become at this time, that he was sent as representative of the German bund (the first that ever was sent) to the London conference, where he stood his ground firmly, taking for his basis the principle of nationalities. Always the friend of Austria, he naturally supported that country in the crisis of 1866, joining in the declaration of war against Prussia, against the wishes of at least the liberal party in Saxony. After the termination of the "six weeks' war," he was obliged, at the demand of Prussia, to resign his office. He has since entered the service of Austria, and risen to the head of affairs. The chief result of his policy in the reorganization of the empire is the reconciliation of Hungary (1867) on the footing of its remaining a separate kingdom. See GERMANY. In 1871, he resigned the office of chancellor, and from that year till 1878 was ambassador in England.

BEU'THEN, or BÜTOM, a t. of Prussian Silesia, the capital of a circle of the same name, in the government of Oppeln, and 50 m. s.e. from Oppeln, near the Polish frontier. It has manufactures of woolen cloths and earthenware. The language generally spoken is Polish. Pop. '75, 19,367.

BEVEL, a term used by builders to describe a sloped or canted surface. See SPLAY.

BEVELAND, NORTH and SOUTH, two islands in the estuary of the Scheldt, Netherlands province of Zeeland. South B. is the largest and most fertile, containing 84,000 acres, with a pop. of 34,325. The chief town, Goes (Hús), near the n. side, is well built, and has 6239 inhabitants. Making salt, leather, beer, candles, oil, chocolate, weaving cottons, and book-printing are the chief industries. South B. produces wheat and other grain, colza, madder, potatoes, and fruit abundantly. Fish are plentiful. North B. is low and marshy, has an area of 15,250 acres; pop. '75, 7308, employed

with agriculture. Both islands have suffered dreadfully from inundations. In 1532, North B. was completely covered with water, many of the inhabitants perishing; and it remained submerged for several years. At the same time, the flourishing town of Romerswaal was separated from South B., and afterwards so encroached on by the sea, that the whole of the inhabitants had to leave it. The islands also suffered considerably from inundation in 1808. Within recent years, much good has been effected by drainage,

BEVELLED-GEAR. See GEARING.

BEVERIDGE, WILLIAM, Bishop of St. Asaph, was b. at Barrow, Leicestershire, in 1638. Entering St. John's college, Cambridge, at the age of 15, he at once became remarkable for his diligence and piety, and particularly for his devotion to the study of oriental languages, a treatise on which he published at the age of 20. In 1660, having obtained his degree of M.A., he was ordained both deacon and priest. After many excellent preferments, in which he was remarkable for his devotion to his pastoral duties, he was, in 1704, appointed to the bishopric of St. Asaph, having previously refused to accept that of Bath and Wells, on the deprivation of Dr. Thomas Kenn, for not taking the oaths to the government of William III. He died March 5, 1708, leaving the great bulk of his property to the societies for the promotion of Christian knowledge, and the propagation of the gospel in foreign parts, and a reputation for sincere piety and great learning. His works, which, besides the treatise mentioned, include another on chronology, a collection of canons from the time of the apostles to that when the synod of Constantinople restored Photius, and various sermons and works of a religious kind, with a life, were collected and published in 9 vols. 8vo in 1824, by the Rev. Thomas Hartwell Horne.

BEVERLAND, ADRIAN, a Dutch scholar who, by several of his writings, but more especially by his unorthodox interpretation of the fall, caused great excitement among the theologians of his day. He was born at Middelburg, in Zeeland, about the middle of the 17th c.; had studied law, visited the Oxford university, and was settled as an attorney in Holland, when, in 1678, he published his pamphlet, *Peccatum Originale*, which was not only burnt at the Hague, but led to his own imprisonment, and to his expulsion from Utrecht and Leyden, whither he had wished to betake himself. On his return to the Hague, he wrote *De Stolatæ Virginitatis Jure* (the Hague, 1680), which gave still greater offense than his first work. Soon after, he came to England, where he found a supporter in Isaac Vossius, and probably received his degree as doctor of civil law in Oxford. But it would appear from his virulent attacks against several dignitaries of the English church, that he met with a good deal of theological opposition in England also. Probably it was the death of his benefactor, Isaac Vossius, in 1689, that led him in 1693 to repudiate his earlier writings, and to regret their tone. Having become insane, he appears to have died in England soon after 1712. In spite of his numerous enemies, B. stood high in the friendship of some of the most distinguished men of his time. His views respecting original sin have been often expressed by others, both before and after his day, though in a less flippant style. His works are now mere bibliographical curiosities.

BEVERLEY, the chief t. of the e. Riding of Yorkshire, 1 m. w. of the river Hull, with which it communicates by canal, and 10 m. n.n.w. of the city of Hull. B. formerly returned two members to parliament, but was disfranchised in 1870. Its trade consists in corn, coal, and leather, and there are several whiting and agricultural implement manufactories. The finest object in B. is the superb Gothic minster or the collegiate church of St. John, ranking next to York minster among the ecclesiastical structures of the country, and exhibiting different styles of Gothic architecture; the oldest part being of the 13th century. The choir contains the celebrated Percy shrine, of the most exquisite workmanship. The grammar-school of B. is so old, that the date of its foundation is unknown. B. arose out of a priory founded about the year 700, and received its name from Beverlac, "lake of beavers," from the great number of these animals in a neighboring lake or morass. Pop. '71, 10,218.

BEVERLEY, JOHN OF, a prelate of the 7th and 8th c., born in Northumbria, and tutor of the venerable Bede. He was bishop in Hexham in 685, and archbishop of York in 687. In 717, he resigned and retired to a college which he had previously founded at Beverley, where he died in 721. Among his works are *Exposition of Luke, Homilies on the Evangelists*, and a number of epistles.

BEVERLOO', a village of Belgium, in the province of Limbourg, 12 m. n.w. of Hesselt. On the extensive heaths near is the permanent military camp for the instruction of the Belgian army.

BEVERLY, a t. in Essex co., Mass., on the Eastern railroad, 18 m. from Boston, connected with the city of Salem by a bridge. It has many fine residences of Boston merchants, which overlook its good harbor. Many of its people are engaged in the business of fishing. Pop. of township, '80, 8,445.

BEVERWYK, a pleasant village in n. Holland, with extensive meadows on one side and well-wooded country-seats on the other, 7 m. n. from Haarlem; pop. '75, 3339, who live by gardening and various trades. Strawberries and vegetables are cultivated for

the Amsterdam and Haarlem markets. There is a haven with a branch canal leading to the large canal from the North sea to Amsterdam.

BEWD'LEY (formerly Beaulieu, from its pleasant situation), a t. on the right bank of the Severn, in the n.w. of Worcestershire, 14 m. n.n.w. of Worcester. Pop. '71, 7614. B. returns one member to parliament. It has manufactures of leather, combs, lantern leaves, carpets, and iron and brass wares. The chief transit for goods is by the Severn. Near the town is a public park of 400 acres, with fine groves of elm, oak, and plane.

BEWICK, THOMAS, a celebrated wood-engraver, was b. at Cherryburn, near Newcastle-on-Tyne, in 1753. Apprenticed to Beilby, an engraver in Newcastle, he displayed such extraordinary aptitude in his art, that, at the age of 17, he was intrusted with the cutting of the whole of the diagrams in *Hutton's Treatise on Mensuration*. He afterwards illustrated *Gay's Fables*, obtaining in 1775, for one of the cuts, the "Old Hound," the prize which the society of arts had offered for the best wood-engraving. In 1790, B., who had entered into partnership with Mr. Beilby, completed, along with his brother John, who was his pupil, the illustrations for a *General History of British Quadrupeds*, a work which raised his reputation far above that of any of his contemporaries, and gained for him the honorable and not undeserved appellation of the reviver of wood-engraving. Considered as works of art, these illustrations are still unrivaled in graphic force of expression and fidelity to nature, though the great mechanical improvements in the art introduced since B.'s time have rendered them inferior in clearness and delicacy of execution to some of the best cuts of the present day. Assisted by his brother, B. illustrated Goldsmith's *Traveler* and *Deserted Village*, Parnell's *Hermit*, and Somerville's *Chase;* and in 1797 appeared the first volume of his *History of British Birds*, which was followed in 1804 by the second. This splendid work was entirely B.'s own, his brother having died in 1795. B.'s last work, the unfinished proofs of which he received the Saturday before his death, which took place at Gateshead, Nov. 8, 1828, is called "Waiting for Death," and represents an old worn-out horse, with great pathos and truth. It was designed to assist in the prevention of cruelty to animals. A large cut of a bull—of the Caledonian breed—is considered B.'s *chef-d'œuvre*. B. had many pupils, some of whom were afterwards eminent as engravers.

BEWLEY, ANTHONY, b. Tennessee, 1804; hanged by a mob in Texas, Sept. 13, 1860. In 1843, he entered the Missouri conference as a Methodist minister, but when the church divided on the slavery question he adhered to neither side, but preached independently, earning his living by manual labor. Other independents supported him, and he became by their consent a presiding elder. When the church in Missouri was reorganized in 1848, he came back to its service. In spite of the universal persecution of "abolition preachers," he kept the tenor of his way, and in 1858 was sent to Texas. He was driven out by violence, but returned to the work in 1860, saying to protesting friends, "Let them hang or burn me if they choose, a hundred will rise out of my ashes." But the opposition was so great that he was again compelled to leave. Then a reward was offered for his head, and he was kidnapped in Missouri, hurried off to Texas, and hanged.

BEX, a village of (1870) 3804 inhabitants, in the Swiss canton of Vaud, situated on the high-road to the Simplon, about 26 m. s.e. of Lausanne. It is remarkable for its extensive salt mines, salt works, and sulphur baths. One of the mines, called *Du Bouillet*, has a gallery 7½ ft. high, and 5 ft. wide, extending horizontally into the mountain a distance of more than 2000 yards. The quantity of salt annually produced at B. is between 1000 and 2000 tons.

BEXAR', a co. in s.w. Texas; intersected by the Galveston, Harrisburg and San Antonio railroad; 1450 sq.m.; pop. '70, 16,043—2303 colored. Productions, corn, cotton, wool, butter, and cattle. Co. seat, San Antonio.

BEXAR', SAN ANTONIO DE, a thriving t. of Texas, on the San Antonio river, at a distance of 110 m. to the s.w. of Austin city. It is growing rapidly in population (which amounted in 1870 to 12,256) and in wealth. The place possesses six newspapers, several seminaries, three flouring-mills, three breweries, etc. San Antonio de Bexar was famous in the conflicts between the Mexican authorities and the American adventurers, more especially for the indiscriminate slaughter by the former of col. Crockett and his garrison.

BEXAR' DISTRICT, or TERRITORY, a region of n.w. Texas between the Rio Pecos, New Mexico, and the Indian territory; pop. '70, 1077, about one person to 40 sq.miles. Most of the n.w. part is a high table-land without wood or water; the n.e. and e. portion is well watered by the streams that run into the Brazos and the Colorado.

BEY'ERLAND, a district in s. Holland, bounded s. by the Hollandish Diep and Haringvliet. It has several thriving villages, of which Old B. has 4620 inhabitants; South B., 1703; and New B., 1263; the whole canton, 16,000. The people are engaged in agriculture, have many orchards, and grow flax extensively. An inland shipping trade is carried on in summer.

BEYLE, MARIE-HENRI, 1783–1842; a French soldier and author, better known as "De Stendhal," the most celebrated of his many *noms de plume*. He was about to enter the polytechnic school, when by chance he was present at the battle of Marengo. Car-

ried away by enthusiasm, he enlisted as quartermaster of dragoons, rose to be lieutenant, and acted as aid-de-camp to gen. Michaud. After the peace of Amiens, he left the army and led a roving life—studying in Paris, becoming a mercantile clerk in Marseilles, running after a beautiful actress, who spoiled his romance by marrying a rich Russian—and returned to war in the commissariat of Napoleon's ill-fated Russian expedition, where he remained loyal to the fallen emperor. After the restoration he resided in Milan until 1821, when he was suspected of being a French spy, and hastily returned to Paris, remaining there nine years, acquiring fame as an accomplished writer and man of the world. In 1830, he was consul at Trieste, and afterwards at Civita Vecchia, finally returning to Paris a year before he died. He wrote lives of Haydn, Mozart, and Metastasio; a history of Italian painting; *Rome, Naples, and Florence* in 1817; a life of Rossini; *De l'Amour;* an essay on Racine and Shakespeare; and *Promenades dans Rome.* He was an admirable conversationist, full of anecdote and apt in application.

BEY'ROUT, or BEIRUT, the Berothai or Berothah of the Old Testament (2 Samuel viii. 8, and Ezekiel xlvii. 16); and the Berytus of the Romans. It was besieged and captured by Baldwin I., king of Jerusalem, in 1111; recaptured from the Christians in 1187. In 1197, it again came into the hands of the Christians, and then successively under the Saracen, Seljukian, and Turkish sultans. In course of the operations to support the Turkish claims against the assumed power of the pasha of Egypt, B., in 1840–41, was bombarded by the English fleet under sir C. Napier, taken, and delivered over to the Turks. There are three castles still standing out in the sea, whose battered walls bear witness to the efficacy of the British cannon. There are no ancient monuments worth visiting.

B. is a flourishing commercial town, situated in a most picturesque position on the coast of Syria, and at the foot of Lebanon, 55 m. from Damascus, and 147 from Jerusalem. It is the chief seaport, market-town, and emporium of all the trade with the shores of Syria, Palestine, and Cilicia; and has a pop. of about 70,000 (the majority of whom are Christians) against 12,000 in 1835. A considerable increase in population is due to the settlement, in 1860, of numbers of the Christian refugees from Damascus. Several British merchants are established in B., and there is a branch here of an English bank (the Ottoman). B. supplies the Lebanon, Damascus, and the n. of Syria to Antioch, and Joppa, with European manufactures and goods. French steamers, carrying mails, leave B. every week for Marseilles. British steamers ply regularly between England and B. every fortnight, bringing Manchester manufactures, prints, chintzes, Birmingham and Sheffield cutlery, etc., and returning to England with madder roots, wool, silk, and bitumen. Since 1859, a direct trade has been carried on between B. and the United States of America, the articles sent to the United States being wool and olive-oil; and since the opening of the Suez canal, a direct eastern trade in spices, indigo, and Mocha coffee has sprung up. There is good anchorage in the roadstead, with shelter during stormy weather in the Beyrout river, about 3 m. from the town; and in 1874, £10,000 was allotted by the authorities for the construction of a harbor. About 350 merchant vessels of different nations visit and leave B. every year. The commerce is steadily increasing. In 1848, the imports were only £546,266; in 1873, they were £1,323,152. The exports in 1848 amounted to £253,648; in 1873, they were £668,568. In 1853, the imports into B. from Great Britain were £225,875; in 1871, they had increased to £676,900. A commercial tribunal, composed of European and native merchants, to adjudicate all mercantile disputes and bankruptcies, has lately been established; and consuls from all nations reside at Beyrout. Ship-building has begun to attract the attention of the natives, who have built and launched at B. several vessels of 50 to 80 tons within the last few years. There are extensive factories in the neighborhood, producing "Syrian silk," which is much esteemed in the London and Lyon markets. In 1859, a line of omnibuses, the first ever seen in Syria, was established at Beyrout. The natives at first regarded them with great astonishment, and crowded from all sides to see them pass. A French company completed in 1863 a good road from B. to Damascus. In 1875, an English company completed an extensive system of water-works, bringing a supply of excellent water from the Nahr-el-kelb, or Dog river, a distance of 9 miles. The town has lately been improved by the removal of the walls which formerly surrounded it. From its proximity to the mountains of Lebanon, on which the climate is most agreeable and salubrious, B. is an attractive place of residence; and it might rise into importance but for its odious Turkish custom-house arrangements and system of government.

BEZA, THEODORE (properly, De Bèze), next to Calvin the most energetic and influential of the Genevese reformers, was born of a noble family at Vezelai, in Burgundy, 24th June, 1519. He received an admirable education in Orleans, from Melchior Wolmar, a German, who was especially learned in the Greek language, and also imbued with the principles of the reformation, which he communicated to his pupil. As early as 1539, B. became known as a writer of witty and elegant but indecent verses, the publication of which (1548) caused him many bitter regrets in after-days, when his heart was purer. In his 20th year, he obtained his degree as licentiate of civil law, and went to live in Paris, where he appears to have spent several years in a kind of fashionable dissipation, though he does not accuse himself of any gross profligacy.

B. possessed a handsome figure, which, together with his fine talents and good birth, opened to him the most brilliant prospects. Although not a priest, he pocketed the revenues of two benefices, while his income was largely increased by the death of an elder brother. It was the desire of his relatives that he should enter the church, but a private marriage which B. had contracted, rendered this impossible. A severe illness now attacked him, during the lapse of which, the folly and sinfulness of his career vividly presented themselves to his conscience; he repented, and on his recovery, in order to avoid the perils and perplexities of his position, he went to Geneva along with his wife, Oct., 1548. Shortly after, he was appointed Greek professor at Lausanne, an office which he held for ten years. In 1550, he published with success a melodrama, entitled *The Sacrifice of Abraham*, and delivered lectures on the epistle to the Romans and the epistles of Peter to crowded audiences. Out of these lectures ultimately sprang his translation of the New Testament into Latin. In 1559, he went to Geneva, where he became Calvin's ablest coadjutor, and was appointed a theological professor and president of the college. He had already signalized himself by his work *De Hæreticis a Civili Magistratu puniendis*, in which, like many other good but mistaken men, he approved of the burning of Servetus. His diplomatic tact was particularly good. He induced the king of Navarre to exert his influence on behalf of the persecuted French Protestants, and was persuaded by the latter to attend the conference of Catholic and Protestant divines, held at Poissy in 1561. Here his courage, presence of mind, and dexterity made a very favorable impression on the French court. Catharine de Medicis entertained so high an opinion of his abilities, that she desired him to remain in France. While in Paris, he often preached before the king of Navarre and Condé. On the outbreak of the civil war, he accompanied the latter as a kind of military chaplain, and after his capture attached himself to Coligny. In 1563, he once more returned to Geneva. In the following year, Calvin died, and the care of the Genevese church now fell principally upon his shoulders. He presided over the synods of French reformers, held at Rochelle in 1571, and at Nimes in 1572. In 1574, he was deputed by Condé to transact important business at the court of the Palatinate; and in 1586 measured himself with the Würtemberg divines, especially Jacob Andreä, at the religious conference held at Montbeliard. In 1588, his first wife died, and although verging on 70, he married another—an awkward circumstance, it must be confessed, and one which his enemies, the Jesuits, tried to make a handle of; but B., who still retained complete mastery over his faculties, retorted with his accustomed liveliness and skill. In 1597, his calumniators spread the extremely foolish report that B. was dead, and at the last hour had returned to the bosom of the church. The witty patriarch replied in a poem full of sparkling vigor. He died 13th Oct., 1605, at the ripe age of 86.

B. was thoroughly grounded in the principles of his master, Calvin, in whose spirit he vigorously ruled the Genevan church for forty years, exercising the influence of a patriarch. To secure its unity, strength, and permanence, he spared no pains, sacrificing even his personal possessions. By his abundant learning, his persevering zeal, his acute intellect, his fine eloquence, and his impressive character, he rendered it important services. His numerous theological writings, however, cannot be said to have proved attractive to posterity. They have almost ceased to be read. The works by which he is best known are his translation of the New Testament into Latin, and his *History of the French Protestants from* 1521 *to* 1563.

BEZANT. See BESANT.

BEZA'S CODEX, or CAMBRIDGE MANUSCRIPT, an ancient vellum containing the Greek text of the four gospels entire in the order used in the English Bible, the Acts (except a number of omissions), and fragments of the epistles. It is believed to date from the 6th c., and is noted for many interpolations, there being 600 in the Acts alone. It was presented to Cambridge university by Theodore Beza, who obtained it about 1562 from a Huguenot soldier who took it from a monastery in Lyons. It has been printed twice.

BEZ'DAN, a market-t. of the Austrian empire, in the Hungarian province of Bacs, about 3 m. e. of the Danube, and 12 m. w.n.w. from Zombor. Pop. '69, 7573.

BEZETHA, one of the four hills on which Jerusalem is built, n. of Antonia, from which it was separated by a deep ravine. It was not inclosed until Agrippa built the third wall.

BEZIERS, a city of France, in the department of Herault, at 43° 21′ n. and long. 3° 13′ e. It is pleasantly situated on a hill, in the midst of a fertile country, at the junction of the Orb and the canal du Midi, about 38 m. s.w. of Montpellier. It contains some interesting architectural and antique buildings—the principal being the cathedral, a noble Gothic edifice; the churches of La Madeleine and St. Aphrodise; and the ancient episcopal palace. The old citadel has been destroyed, but the walls still remain, and are made use of as a promenade. B. has manufactures of silk stockings, woolens, gloves, parchment, glass, soap, leather, and much esteemed confectioneries. It has also extensive brandy distilleries, and is the center of most of the trade of the district. The town is supplied with water raised from the Orb by means of a steam-engine. Pop. '76, 36,928.

B. is a place of great antiquity, and still contains Roman remains. It is historically interesting in connection with the massacre of the Albigenses, its inhabitants having been indiscriminately put to the sword by Simon de Montfort and the pope's legate, for having afforded protection to the fugitives in 1209. B. suffered also in the religious wars of the 16th century.

BEZIQUE (from Sp. *besico*, "little kiss," in allusion to the meeting of the queen and knave), a game at cards played with a double pack, from which the twos, threes, fours, fives, and sixes have been rejected. The remaining cards rank from ace down, as in whist. The dealer gives three cards to his adversary, three to himelf, then two to each, and lastly three to each, and turns a trump. Tricks are taken as in whist except when the cards are equal, such as two tens together, when the leader wins the trick. After each trick the player draws one card from the stock, the winner taking the top card and the loser the next, the trump card or the one exchanged for it being taken up last. The object of the game is to promote in the hand various combinations of cards which, when declared, entitle the holder to certain scores; to win aces and tens; and to win the so-called last trick. A declaration must be made as soon as the trick is taken and before drawing from the pack, and this is done by placing the declared cards (one of which must not have been declared before) face upward on the table; but they still form part of the hand and can be led or played just as though they had not been declared. (The rules are too long to be inserted here.) There are also three or four bezique, when three or four packs are used. The game is usually 1000 points, and the scores vary from 10, for the seven of trumps played or exchanged, to 500 for double bezique. If clubs or hearts are trumps, the bezique cards are queen of spades and knave of diamonds, and *vice versa* when spades or diamonds are trumps. The deal goes from one to another alternately until the game is finished.

BE'ZOAR (Pers. *pazar*, a goat; or *pa*, against, and *zachar*, poison), a concretion found in the stomachs of goats or antelopes, and formerly much valued on account of imaginary medicinal virtues, particularly as an antidote to poisons. Concretions of various kinds are found in the stomachs of herbivorous quadrupeds, very generally having for their nucleus some small indigestible substance which has been taken into the stomach. Sometimes they are of a radiating structure; sometimes formed of concentric layers; sometimes they are principally composed of superphosphate of lime, sometimes of phosphate of ammonia or magnesia. Other concretions found in the intestines, etc., of various animals are sometimes also called bezoar. See CALCULI. The value of a B. being supposed to increase with its size, the larger ones have been sold, particularly in India, for very great prices.

BHADAR'SA, a t. of British India, in the chief-commissionership of Oude, on the Tons, 75 m. e. from Lucknow. Pop. 5000, of whom 2000 are Mussulmans. Here is an eleemosynary establishment, founded by the Nawab Vizier Asaf ud Dowlah, with an endowment of 15,000 rupees a year, the proceeds of which are divided indiscriminately among Mussulman and Hindu religious mendicants. It is under the charge of a seiad, or descendant of Fatima.

BHADRINATH', a t. of Gurhwal, in the lieut.-governorship of the North-western Provinces, India, situated in a valley of the Himalaya, 25 m. to the s. of the Manah pass, which leads into Thibet. Lat. 30° 44′ n., long. 79° 33′ e. Its highest point is 10,294 ft. above the level of the sea; while, about 12 m. to the w., there is a group of summits, called the Bhadrinath peaks, having the respective elevations of 23,441, 23,336, 22,934, 22,754, 22,556, and 21,895 ft.; the e. also, and the s.w., presenting detached mountains of similar magnitude. B. is situated on the right bank of the Vishnugunga, a feeder of the Aluknunda, which itself again unites with the Bhageerettee to form the Ganges. The chief attraction of the place is its temple, which, though the actually existing edifice is modern, is said to be an establishment of great antiquity. This temple overhangs a tank of about 30 ft. square, which is supplied, by a subterranean passage, from a thermal spring in the neighborhood. As ablution in these waters is held to cleanse from all past sins, B. is a grand resort of pilgrims, every year bringing large numbers, but every twelfth year, when a periodical festival is celebrated, collecting fully 50,000. From Nov. to April, the temple and its deity are abandoned even by the attendant Brahmins, on account of the cold.

BHAGAVAD-GÎTÂ (i.e., Revelations from the Deity) is the title of a religious metaphysical poem, interwoven as an episode in the great Indian epic poem of the Mahâbhârata (q.v.) Two hostile armies, the nearly related Kurus and Pândus, are drawn up in opposition, ready for battle; the trumpets sound the opening of the combat; and the Pându Ardshuna mounts his chariot, which is guided by the Deity himself, as charioteer, in the human form of Krishna. But when Ardshuna perceives in the hostile army his relatives, the friends of his youth, and his teachers, he hesitates to commence the struggle, held back by the doubt whether it were lawful for him, for the sake of the earthly gain of reconquering his father's kingdom, to transgress the divinely approved ordinances for the government of the state. Upon this, Krishna sets forth, in a series of eighteen poetic lectures, the necessity of proceeding, unconcerned as to the consequences. In the progress of his long discourse, a complete system of Indian relig-

ious philosophy is developed, in which the highest problems of the human mind are treated with as much clearness of thought as elegance of language. It is impossible to determine exactly when and by whom the work was composed. It is not, however, one of the first attempts of Indian philosophy, for it is rather of an eclectic nature; and before it could have been composed, there must have been a period of long-continued intellectual cultivation in many philosophic schools. It is not unlikely that it was written in the 1st c. after Christ. The work is looked upon with great reverence in India, and it has accordingly been made the subject of numerous commentaries (the best is that of Sridhara-Svâmin, published in Calcutta in 1832), and it has likewise been translated into various Indian dialects. Five different metrical versions in Hindi appeared in Bombay in 1842; a translation into the Telugu dialect in Madras, 1840; into the Canarese, Bangalore, 1846, etc. The best critical edition of the Sanskrit text is that of A. W. von Schlegel (2d ed., Bonn, 1846), to which is added a Latin translation. Among the other translations may be mentioned that into English by Wilkins (Lond. 1785), who had the credit of first making the work known in Europe; that into German, by Peiper (Leip. 1834); and the Greek translation by Galanos (Athens, 1848). W. von Humboldt's treatise, *Upon the Episodes of the Mahâbhârata, known under the Name of the Bhagavad-Gîtâ* (Berlin, 1827), contains an admirable exposition of the philosophy of the poem.

BHAGULPORE', the capital of a district and division of the same name in Behar, presidency of Bengal, lat. 25° 11′ n., long. 87° east. It stands on the right bank of the Ganges, which is even here 7 m. wide in the rainy season. A seminary for English instruction has been here established by the British government. It is the headquarters of the troops for keeping in check the Sonthal tribes. Pop. '71, 69,678. In the vicinity of the town are two round towers of about 70 ft. in height, of the origin or object of which nothing is known.—2. B., as a district, contains 4527 sq.m., and '71, 1,826,290 inhabitants. It lies s. of Nepaul, in lat. 24° 17′ to 26° 20′ n., long. 86° 15′ to 88° 3′ east. About a fifth is covered by hills, which, stretching to the s.w., connect themselves with the Vindhya mountains, the grand dividing-ridge between the Nerbudda and the Ganges.—3. The division of B. has an area of 18,685 sq.m., and a pop. '71, 6,613,358.

BHAMO', a t. of Burmah, on the Upper Irrawaddy, 40 m. to the w. of the Chinese frontier, and 180 to the n.n.e. of Ava. It contains 1000 houses, and has round it many populous villages. It is the chief mart of the trade with China, the imports being woolens, cottons, and silks, which are brought chiefly by caravans. B. has also a considerable trade with the tribes of the neighborhood, who exchange their native produce for salt, rice, and a sauce made of dried fish. There is a British resident, and steamers ply to Rangoon.

BHANG, the eastern name for hemp (q.v.).

BHANPURA. See BAMPURA.

BHARTRIHARI is the name of a celebrated Indian writer of apothegms. Little is known regarding the circumstances of his life. A legendary story makes him the brother of king Vikramâditya, who lived in the 1st c. B.C., and relates of him, that after a wild licentious youth, he betook himself in later years to the ascetic life of a hermit. His name has been given to a collection of 300 apothegms—whether it be that he actually wrote them, or, as is more probable, that the apothegms were popular works, written by many various authors, but ascribed, according to the Indian custom, to some personage well known among the people in legends and tales. Cheerful descriptions from nature, and charming pictures of love, alternate in these apothegms, with wise remarks upon the relations of life, and profound thoughts upon the Deity and the immortality of the soul. Bohlen has published an excellent critical edition (Berlin, 1833), with a supplement, *Variæ Lectiones* (Berlin, 1850), as well as a successful metrical translation into German (Hamburg, 1835). B. has a certain special interest as having been the first Indian author known in Europe, 200 of his apothegms having been translated in 1653, by the missionary, Abraham Roger, in a learned work published at Nuremburg, under the quaint title, *Open Gates to Hidden Heathenism.*

BHATGONG', one of the chief towns of Nepaul, situated about 9 m. s.e. from Khatmandu. It contains a palace of striking appearance, and other notable buildings. It is the favorite residence of the Brahmans of Nepaul, who form the greater part of its inhabitants. Its present population is estimated at 12,000, but it is supposed to have once contained 60,000 inhabitants

BHATNIÁR, or BHATTIS, a people of northern Hindustan, in the British district of Hissar. There are two races, one of Mohammedans of Rajput descent, who are the influential class; the other the common people, known as Játs, who adhere to the religion of their immediate superiors, and are by them treated with moderation. A portion till the soil, but most of them are shepherds. While under native rulers they appear to have been a horde of freebooters, savage and even ferocious in disposition. Their rajah could raise 20,000 or 30,000 men for war, but they had nothing like discipline. Their former capital (of the same name) was taken in 1398 by Timur, at a later period by George Thomas, an English military adventurer, and in 1805 by the rajah of Bikánir, who still retains authority over it. The principal town is Sirsá, between which and Bháwalapur a route for commerce has been opened.

BHAVANI-KUDAR', or BHOVANI-KUDAR, a t. in the presidency of Madras, in the district of Coimbatoor, 58 m. to the n.e. of the city of that name. It takes its name from its position at the confluence of the Bhavani or Bhovani, and the Cauvery. It is worthy of notice chiefly for its temples of Vishnu and Siva. Pop. '71, 6776.

BHAWLPOOR', the capital of the protected state of the same name in India, is situated on a tributary of the Ghara, which, formed by the junction of the Sutlej and the Beas, falls into the Chenab about 50 m. further down, in lat. 29° 24′ n., and long. 71° 47′ east. It has a circuit of 4 m.—part, however, of the inclosed space being occupied by groves of trees; and its population is estimated at 20,000. B. has manufactures of scarfs and turbans, chintzes, and other cottons, and the immediate neighborhood is remarkably fertile in grain, sugar, indigo, tobacco, and butter, with an abundance of mangoes, oranges, apples, and other fruits, in perfection. For external commerce, too, B. is favorably placed, standing at the junction of three routes respectively from the e., s.e., and s.; while, towards the n., the Hindu merchants, who are very enterprising, have dealings with Bokhara, and even with Astrakhan.—2. The state of B. lies in lat. 27° 41′ to 30° 25′; and long. 69° 30′ to 73° 58′ east. The area is about 15,000 sq.m.—the population being approximately estimated at 472,800 in 1871, or rather more than 31 inhabitants to a square mile. The country is remarkable level: only about one sixth is capable of cultivation. The fertile portion, skirting the Ghara and the Indus, has a purely alluvial soil; but the remainder, though presenting many traces of former cultivation and population, is now, from want of water, an irreclaimable desert either of hard dry clay, or of loose shifting sands. Besides beasts of chase, such as tigers, boars, etc., B. abounds in domestic animals, such as camels, kine, buffaloes, goats, and broad-tailed sheep. In few parts of the world are provisions finer or cheaper. The principal exports are cotton, sugar, indigo, hides, drugs, dye-stuffs, wool, ghee or butter, and provisions in general. The principal imports are the wares of Britain and India. In 1866, the state, at the request of the leading men, was taken under British management till the young nabob should be of age. The great majority of the inhabitants are Mohammedans.

BHEL, or BAEL. See ÆGLE.

BHIL, a native tribe in central India, friendly to the English, which has done good service in suppressing the predatory habits of its neighbors. In common with other hill-tribes, the B. are supposed to have been aborigines in their region. They are of dark complexion and diminutive stature, but active and capable of enduring much fatigue. It is with much difficulty that they are reconciled to the life of agriculturists.

BHOOJ, the capital of Cutch, in India, situated at the foot of a fortified hill of the same name, where a temple has been erected to the cobra de capella, in lat. 23° 15′ n., and long. 69° 44′ e., about 35 m. from the sea. It contains about 20,000 inhabitants. Its mosques and pagodas, interspersed with plantations of dates, give to the town an imposing appearance from a distance. In 1819, it suffered severely from an earthquake. It is celebrated over India for its manufactures in gold and silver.

BHO'PAL, the capital of the territory of the same name, in India, lies in lat. 23° 14′ n., and long. 77° 33′ east. It is surrounded by a dilapidated stone wall of about 2 m. in circuit. The fort, which is the residence of the nawab, stands on a huge rock outside the town. B. is worthy of notice mainly in connection with two immense tanks in the immediate neighborhood—one of them being 2 m. in length, and the other measuring 4¼ m. by 1½. As each sends forth a river, they have most probably been formed by the embanking and damming up of their respective streams.—The territory of B. is a protected state, under the immediate superintendence of the governor-general. It is situated within the basins of the Ganges and Nerbudda, in lat. 22° 32′ to 23° 46′ n., and long. 76° 25′ to 78° 50′ e.; its area being estimated at 6764 sq.m., and its population, on an assumed average for Central India, at 662,872. Though the vast mass of the people are Hindus, yet the government is Mohammedan, and is understood to be more popular in its character than any other in India.

BHOTAN', or BOO'TAN, an independent territory in the n.e. of India, on the southern slope of the Himalayas, in lat. 26° 18′ to 28° 2′ n., and long. 88° 32′ to 92° 30′ e., being bounded on the e. by Assam, on the s. by Bengal, and on the w. by Sikkim. With an area of 10,000 to 20,000 sq.m., it was estimated in 1864 to contain only 20,000 inhabitants, but later information points to a larger figure. The whole surface may be described as mountainous, with a gradual slope from n. to south. Generally speaking, the middle ranges are the most productive. While the s. presents but a scanty vegetation, and the n. rises far above the limit of perpetual snow, the central regions, at an elevation of 8000 or 10,000 ft. above the sea, are covered with the finest forests of oak and pine. Nearly all sorts of grain—wheat, barley, rice, maize, and buckwheat—are here and there cultivated on favorable spots: but much grain is still imported from Bengal, being obtained, as well as sugar and tobacco, in return for native cloths, rock-salt, rhubarb, Thibet goods, mules, and ponies. The religion is Buddhism, the monastic endowments of its priests absorbing a large part of the national property. The government, almost purely ecclesiastical, is in the hands of an oligarchy. The dherma rajah, the nominal head, is treated rather as a god than as a sovereign; while the deb rajah,

the actual head, is controlled in almost everything by a council of eight. Polyandry and polygamy equally conspire to keep down the numbers of the population.

BHOWAN', BHOWANY, BHEWANNEE, or BHIWANI, a t. of British India, in the district of Hissar, Punjab, 55 m. w. of Delhi. The pop. in 1868 was 32,254.

BHU'JI, or BIJI, a small hill-state of India, extending for about 20 m. along the left bank of the Sutlej, and about 7 m. at its greatest breadth. Its pop. is about 20,000. Having been overrun by the Goorkhas, it was, on their expulsion, bestowed by the British government on the present family.

BHURTPORE', the capital of the protected state of the same name in India, is a large t., measuring about 8 m. in circuit, and containing, it is said, about 100,000 inhabitants, in lat. 27° 12' n., and long. 77° 33' east. It is worthy of notice chiefly on account of its two sieges in 1805 and 1825. The strength of the place lay in a mud-wall, which was practically shot-proof, and a surrounding ditch, which might at any time be filled with water from a neighboring lake. On the first occasion, lord Lake's assaults were all baffled by this trench thus flooded. On the second occasion, however, lord Combermere, having arrived in time to cut off the communications of the garrison with the lake above mentioned, overcame his principal difficulty; but even then the mud-wall would yield only to mining.—2. The protected state of B. is situated in lat. 26° 48' to 27° 50 n., and in long. 76° 54' to 77° 49' e., its area being estimated at 1978 sq. miles. The pop. in 1871 was 743,710, giving an average of less than 400 to a sq mile. The country suffers from want of water, having only three perennial streams, of which two, however, are mere rills in the dry season; and yet, in many parts, the soil is rendered highly productive by means of irrigation. The principal crops are grain, cotton, and sugar. In the height of summer, the climate has been compared to the extreme glow of an iron-foundry, the thermometer having been known to stand at 130° F. in the shade. The rajah's revenue is stated at £242,375 a year; and his military force is said to amount to 5400 men of all arms.

BIAF'RA, a kingdom in w. Africa on a bay of the same name between 0° and 5° n., extending but a short distance from the ocean. The chief town is B., situated near the coast.

BIA'FRA, BIGHT OF, a large bay of the Atlantic ocean, on the w. coast of Africa, at the head of the gulf of Guinea, between cape Formosa (which divides it from the Bight of Benin) on the n. and cape Lopez on the south. Its extreme width between these two points is nearly 600 m.; its depth, to the mouth of the old Calabar river, about 250 miles. The northern shores of the Bight, comprehended under the general name of the Calabar coast, and the eastern coast s. of cape St. John, are low and flat. Near old Calabar, the country becomes hilly, and opposite Fernando Po, it rises into the lofty range of the Cameroons. The principal rivers flowing into the Bight are the Niger, or Quorra, the new and old Calabar rivers, the Rio del Rey, the Cameroon, and the Gaboon. The creeks and estuaries of the rivers are generally lined with dense thickets of mangrove, which sometimes grow in the water, their lower branches covered with oysters. In the Bight of B. are the three islands of Fernando Po, St. Thomas, and Prince's Island. The chief European stations on the coast are Duke Town, in Old Calabar, where there is a flourishing missionary station, and Naango, or George's Town, a small commercial town on the estuary of the Gaboon.

BIAL'YSTOK, a fortified t. of western Russia, in the government of Grodno. It is situated on the Bialy, an affluent of the Narew, 45 m. s.w. of Grodno, in lat. 53° 8' n., long. 23° 18' east. B. is well built; lime-trees border several of the streets, and give it a very pleasant aspect. It has a palace and park, now belonging to the municipality, but formerly belonging to the counts of Braniski, and called the "Versailles of Poland," a commodious market, and several churches. It has manufactures of woolens, hats, leather, soap, tallow, etc. Pop. '67, 16,985.

BIA'NA, a t. of India, in the Rajpoot state Bhurtpore. It was once a place of much greater importance than it now is, and was one of the most famous forts in India. The town contains many temples, and the whole ridge of the hill is covered with the remains of large buildings. A high pillar of stone called Bhim Lat, or the *staff of Bhim*, is conspicuous over a wide extent of country.

BIANCAVILLA', a t. of Sicily, in the province of and about 14 m. n.w. of the city of Catania. It is about 10 m. distant from Mt. Etna, on the s.w. declivity of which mountain it is situated. It has a trade in grain, cotton, and silk. Pop. 12,500.

BIANCHI'NI, FRANCESCO, celebrated for his antiquarian and astronomical investigations, was b. Dec. 13, 1662, at Verona, where he received his early education in the Jesuits' college. At Padua he studied theology, mathematics, and above all, botany; and then proceeded to Rome, where he became intimate with the most distinguished *savans* of the day, and devoted himself to the study of jurisprudence and foreign languages. Alexander VIII. bestowed upon him a rich benefice, and Clement XI. appointed him secretary to the commission for reforming the calendar. B. was employed to draw a meridian line in the church of Santa Maria degli Angeli, in Rome, which he successfully accomplished. After traveling through France, Holland, and

England, he returned to Italy, with the design of drawing a meridian line from the Adriatic to the Mediterranean like that drawn by Cassini across France. The operations connected with this project occupied him eight years; but a variety of other labors, as well as want of means, prevented its completion. Besides several memoirs and dissertations on antiquarian and astronomical subjects, we may mention his *Istoria Universale Provata coi Monumenti e Figurata coi Simboli degli Antichi* (Rome, 1694), and his fine edition of the work of Anastasius, *De Vitis Romanorum Pontificum*, which was completed by his nephew Giuseppe B. (4 vols., Rome, 1718–34). B. died in Mar. 1729, and a monument was erected to his memory in the cathedral of Verona.

BIARD, AUGUSTE FRANÇOIS, a French painter, known in almost every department of his art, but chiefly distinguished for his animated and often comical representations of ordinary life and manners (*peinture de genre*). B.'s merits, and the school to which he belongs, will be sufficiently understood when we mention that his countrymen have styled him the Paul de Kock of painting! He was born at Lyon in 1800, and was at first destined for the church; but subsequently educated at the school of art of his native city. He traveled in early life in Malta, Cyprus, Syria, and Egypt, where he made sketches, and stored his memory with images which he used in after years. In 1839, he visited Greenland and Spitzbergen, and of this journey one of the fruits was his famous picture of a battle with polar bears. In 1859 he visited Mexico. The first picture which gained him distinction was his "Babes in the Wood" (1828); and one of his best is the "Beggar's Family," exhibited in 1836. His picture, "Les Comediens Ambulants," is in the Luxembourg. Many continental galleries possess examples of B.'s pictures, and in England they have always been much sought after.

BIARRITZ, a maritime village of France, in the department of the Basses-Pyrénées, about 5 m. s.w. of Bayonne. The late emperor and the empress, attracted by its pleasant situation and salubrity, latterly made it a summer residence; and the presence of the court of course tended to increase greatly the fame of its baths and singular grottoes. Pop. '76, 3348.

BIAS, one of the seven sages of Greece, lived in the time of the Lydian king Alyattes, and his son, Crœsus, about 570 B.C. He was generally employed as a political and legal adviser in difficult questions. At the overthrow of Crœsus, when the Ionians dreaded an invasion by Cyrus, they were advised by B. to take their personal property and colonize Sardinia; but this advice was rejected, and the Ionians, after a vain defense, were subjugated by the generals of Cyrus. When the people of Priene—the birth-place of B.—were making preparations to escape from their besieged city, B., in reply to one who asked why he was not occupied like other citizens, employed the words which have become a Latin proverb, *Omnia mea mecum porto*, "I carry all my goods with me."—Orelli, *Opuscula Græcorum Veterum*, etc., 1819.

BIÁS, one of the five streams of the Punjáb, India, rising in the Bhotang pass, 13,000 ft. above sea-level. It traverses the Kubu valley for 75 m., thence w. and s. to the Punjáb plains, and joins the Sutlej after a course of 350 miles. The B. ran in another bed about a century ago, and emptied into the Multán. The natives say its course was changed in 1750.

BIB, POUT, or WHITING POUT, *Gadus luscus* or *Morrhua lusca*), a fish of the same genus with the cod (q.v.) and haddock (q.v.), pretty common on many parts of the British coast, found also on those of Norway, Sweden, Greenland, etc. It is seldom more than a foot long, but remarkably differs from all other British fishes of the same family (*gadidæ*, q.v.) in the great depth of its body, which equals at least one-fourth of the entire length. The back is arched, and the nape exhibits a rather sharp ridge. The eyes and other parts of the head are invested with a singular loose membrane, which the fish can inflate at pleasure. There is a dark spot at the origin of each of the pectoral fins, as in the whiting (q.v.) .The names bib and pout, both originally local English names, were at one time supposed to belong to distinct species (called *G. lusca* and *G. barbata*), but it appears now to be pretty certain that these are really one. In Scotland, this fish is generally called *brassy*. It is well known in the London market, is in best condition in Nov. and Dec., and is much esteemed for the table.

BIBB, a co. in Alabama, on the Big and Little Cahawbas, reached by the Alabama and Chattanooga railroad; 520 sq.m.; pop. '80, 9,487—3,600 colored. It is hilly and fertile. Iron and coal are abundant. Co. seat, Centreville.

BIBB, a co. in Georgia, on the Ocmulgee; traversed by the Central Georgia railroad; 250 sq.m.; pop. '70, 21,225—11,424 colored; in '80, 27,146 It is uneven, and not very fertile; productions, corn, cotton, and sweet potatoes. Co. seat, Macon.

BIBBIE'NA, FERDINANDO GALLI DA, 1657–1743; an Italian painter and architect who first put movable scenery on the stage. He was employed by Charles VI. to conduct triumphal processions, then much in vogue in Europe. He wrote on architecture and the theory of perspective.

BIBER, GEORGE EVERARD, D.D., b. 1801; an English author and clergyman, concerned with Pestalozzi's schools at Yverdun, and author of a biography of that eminent

teacher. He became a British subject in 1839, and is a curate. He has been active in church affairs; was for some years editor of *John Bull*, and has published *The Standard of Catholicity, Sermons, Bishop Bloomfield and His Times, The Value of the Established Church to the Nation*, and *Robbing Churches is Robbing God*.

BI'BERACH, a t. of Würtemberg, in the circle of the Danube. It is situated on the Reiss, in the charming valley of the same name, about 23 m. s.s.w. of Ulm; and is surrounded by portions of the old ramparts flanked with towers. It has manufactures of machinery, artificial flowers, leather, children's toys, etc. Pop. '75, 7376. In Oct., 1796, Moreau won a great victory over the Austrian gen. Latour at B., the latter losing 4000 prisoners and 18 pieces of cannon. Here also, in 1800, Saint Cyr defeated the Austrian gen. Kray. B. fell into the possession of Baden in 1802, but four years afterwards, was ceded to Würtemberg. Wieland the poet was born in the immediate vicinity.

BI'BERICH, a village in the province of Hesse-Nassau, on the right bank of the Rhine, and about 4 m. from Wiesbaden, is noted for its splendid palace. The views of the river-scenery from B. are unrivaled. Pop., including Mosbach, '75, 7692.

BIBES'CO, GEORGE DEMETRIUS, Prince, b. 1804; a statesman of Wallachia who in 1842 aided in the overthrow of Ghika, and succeeded him as ruler, but was driven out by the revolutionary movements of 1848. In 1862, he was elected to the Roumanian parliament, but declined to serve.

BIBIRI, BIBIRI BARK, and BIBIRINE. See GREENHEART.

BIBLE (Gr. *Ta Biblia*, "The Books"—see BOOK) is the name given by Chrysostom in the 4th c. to that collection of sacred writings recognized by Christians as the documents of their divinely revealed religion. Both as regards language and contents, they are divided into two parts—the Old and New Testament, or rather, the Old and New Covenant; for the word *testamentum* is only a translation into the later Latinity of the 2d c. of the Greek *diatheke*, "covenant." The history of the Old Testament is connected with that of the new by a series of writings not received by Protestants as canonical, and collectively styled the *Apocrypha* (q.v.).

The OLD TESTAMENT is a collection of 39 books, written partly in the Hebrew and partly in the Chaldaic language, and containing all the remains of Hebrew-Chaldaic literature down to the middle of the 2d c. B.C. By an artificial arrangement under the letters of the Hebrew alphabet, the number of books has been limited among the Jews to 22. These writings were spoken of in the time of Christ, and for some indefinite period before his time, as *graphé*, Scripture, or Holy Scripture, or, as "the Law and the Prophets." Sometimes the Psalms and the remaining holy writings (*hagiographa*) are distinctively noticed. The *usus loquendi* of the New Testament (Matt. xi. 13, xxii. 40; Acts xiii. 15; Luke xxiv. 44, etc.) is evidence of this. The Law comprised the Pentateuch, or the first five books. The Prophets were subdivided into earlier and later: the former including the books of Joshua, Judges, Samuel, and Kings; and the latter containing the three great prophets, Isaiah, Jeremiah, and Ezekiel—as well as the twelve minor prophets. The third division of the Old Testament embraced the hagiographa, consisting of the books of Job, Proverbs, Psalms, the Song of Solomon, Ecclesiastes, Ruth, Lamentations, and Esther, together with the books of Daniel, Ezra, Nehemiah, and 1 and 2 Chronicles. With regard to the order of these several books, the Alexandrine translation, the fathers of the church, and Luther, on one side, differ from the Jews; again, among the Jews, the Talmudists differ from the Masoretes, while a difference is also found between Spanish and German MSS. Hence have sprung the different arrangements of the books of the Old Testament.

The Septuagint is generally adduced in proof of the existence of these books in a collected form as early as 285 B.C., but an examination of the Aristean fiction (see ARISTEAS and SEPTUAGINT) is sufficient to show that at that period no more than the Pentateuch was translated into Hellenistic Greek. The earliest indubitable notice is found in the prologue to the Alexandrine translation of the book of Jesus, son of Sirach, written by his grandson probably about 130 B.C., which demonstrates that the Law and the Prophets then existed in a collective form; but this language does not prove that the third division was then concluded, though neither does it disprove it. This conclusion is first definitely ascertained from the catalogue given by Josephus, who flourished after the middle of the 1st c. of the Christian era, while Philo, who flourished 41 A.D., quotes casually from nearly the whole of them.

As regards the genuineness and authenticity of the Old Testament, there has been much discussion in modern times. The generally received opinion is, that the various books were *originally* written wholly or chiefly by the persons whose names are affixed to them, except Judges (Samuel), Ruth (Samuel), Esther (Mordecai), Kings and Chronicles (Ezra and Jeremiah), and perhaps Job (Moses?); but that these MSS. having perished in the destruction of the first temple, when Nebuchadnezzar took Jerusalem, the members of the great synagogue (q.v.)—which included Ezra, Nehemiah, Haggai, Zechariah, Malachi, and afterwards Simon the Just—50 years after the building of the second temple, acting in accordance with a divine commission, rewrote the Old Testament; or rather made a recension of other existing copies, to which were subsequently added the

books of Ezra and Nehemiah. Thus the canon was concluded. This was the belief of the Jews themselves at a later period; the *Pirke Aboth* (Sayings of the Fathers), one of the oldest books of the Talmud, as well as other Jewish records, distinctly assert it. It is, however, simply a tradition, and though possibly true, is necessarily incapable either of demonstration or refutation. In the absence of any direct and conclusive evidence on this point, the contents of the Old Testament have been minutely analyzed by modern German critics, who have attempted to show that they bear internal evidence of having been composed generally at a later period than is ordinarily believed. Their work has now been taken up by English, Dutch, and French scholars, of whom perhaps the most notable are Colenso (see NATAL) and Kuenen, and prosecuted with keenness and vigor.

The Samaritans, who were at enmity with the Jews, recognized only the five books of Moses, and a corrupt version of the book of Joshua, as canonical. On the other side, the Egyptian Jews, for whom the Alexandrine version of the Old Testament was made, received as canonical several writings which were rejected, or subordinated as apocryphal (see Apocrypha), by the Jews of Palestine. The primitive church, in the period which elapsed before the canon of the New Testament was completed, referred to the Old Testament for proof of doctrines; but, on account of the prevalent ignorance of the Hebrew and Chaldee languages among the early Christians, the Alexandrine Greek version was the authority employed. As this included the apocryphal books, rejected by the Jews of Palestine, the earliest Christian fathers made the same use of these writings as of the others; but the growth of criticism during the next two centuries was fatal to their reputation, or at least to their authority. We do not find, however, that they were formally designated "apocryphal" until the time of Jerome (5th c.), though the Greek church, in the previous century, had approximated to this mode of viewing them, by affirming them to be *not* canonical, but only edifying, and also by issuing lists or catalogues of those books which were recognized as canonical. In the Latin church, on the other hand, these writings were received as canonical after the 4th c., though Jerome, Hilarius, Rufinus, and Junilius wished to distinguish them from the canonical books by the name of *libri ecclesiastici*. The Protestants, at the reformation, returned to the distinction originally made by the Palestinian Jews between the Hebrew scriptures of the Old Testament and the apocryphal works included in the Alexandrine version and the Latin Vulgate. Luther, in his translation of the B., included the Apocrypha as "books not to be placed on a level with the canonical scriptures; but profitable for reading." The council of Trent, which seemed to think that the only safe path for Catholicism to pursue was the exact opposite of that on which Protestantism moved, declared that whoever denied the canonical character of the Apocrypha should be *anathema*.

The NEW TESTAMENT, or the collection of canonical scriptures containing the history and doctrines of Christianity, may be divided into three chief sections: 1. The historical books, or the four gospels, and the Acts of the Apostles. 2. The didactic and pastoral writings, which include the epistles of Paul to the Romans, Corinthians, Galatians, Ephesians, Philippians, Colossians, Thessalonians, Timothy, Titus, and Philemon, the Epistle to the Hebrews (which does not state the writer's name), the two epistles of Peter, the three epistles of John, the epistles of James and Jude. 3. The prophetical section, consisting only of one book, the Apocalypse, or Revelation of St. John the Divine. The primitive Christians referred for proof of doctrine, etc., only, so far as we are aware, to the Old Testament, and quotations from it by the apostolic fathers are numerous enough; but we find few clear and certain references to the didactic portions of the New Testament. The reason of this appears to be, that the lapse of time had hallowed the Old Testament, and given to it that superior authority which springs from venerable age. The generation which immediately succeeded that of the apostles—and indeed, so far as we can see, the same may be said of the apostles themselves—did not consider the apostolic writings of equal importance *as writings* with the sacred books of the Old Testament. Besides, most of the epistles were of little use in controversy, for the earliest heretics denied the apostleship of St. Paul; while both parties admitted the authority of the Septuagint, and found in it their common weapons of argument. Nevertheless, we occasionally find references to the didactic portions of the New Testament, such as those to Romans, 1st Corinthians, Ephesians, Hebrews, and James, in Clemens Romanus; to 1st Corinthians and Ephesians, in Ignatius; to Romans, 1st Corinthians, 2d Corinthians, Galatians, Philippians, 1st Timothy, 2d Timothy, 1st Peter, and 1st John, in Polycarp. Still more uncertain are the references of the apostolic fathers to the gospels. The notices found in Barnabas, Clemens Romanus, Ignatius, and Polycarp are only sufficient to indicate that all the great facts of Christ's life were known to the churches, and that the doctrinal significance of these had begun to be realized. They do not, however, demonstrate the existence of written gospels, but they prove that Christianity rests on a historic basis. Their silence in relation to the written gospels now constituting a portion of the canon of the New Testament, is at first sight singular; but when we reflect that the facts of the Saviour's life and teaching were apparently quite familiar to the churches—so familiar, indeed, that no explanation was needed in alluding to them—we see that the necessity of the apostolic fathers quoting from the evangelists ceases. It is contended that any specific quotations would have been a work of supererogation; whereas, in the case of the didactic epistles, which were written originally for the benefit of particular churches, and conditioned by their special

circumstances, and the contents of which, therefore, could not be so well or widely known, quotations or allusions might more naturally be looked for. But evidence of this *negative* character for the existence of the evangelical records, however probable, is very uncertain, and its uncertainty is increased by the use made of writings which, at a later period, were rejected as apocryphal. First, in the second half of the 2d c., more distinct references to the gospels are found in Papias (died 163), in Justin Martyr (died 166 A.D.), in his pupil Tatian (died 176), in Athenagoras (died 180), and in Theophilus, who wrote about the year 180. None of these writers, however, name the authors from whom they quote, though Papias—the earliest, but not the most trustworthy of them—bears direct and minute testimony to the existence of gospels by St. Matthew, St. Mark, St. John, the catholic epistles, and the Apocalypse, whence it has been concluded that the authenticity of the apostolic memoirs was not then settled, and perhaps not even investigated; but anonymous quotation seems to have been a characteristic carelessness of the time, for of this kind are 117 of Justin Martyr's references to the Old Testament. The great fact on which a constructive Christian criticism leans in regard to the evidence of these writers is, that they do not speak of the gospels or apostolic memoirs as things which had only recently made their appearance, but as well known and long established. Justin even states that the "apostolic memoirs" were regularly read in the churches for the edification of believers—a fact which clearly indicates their superior sanctity and general reception. The Tübingen school contend that these apostolic memoirs could not have been the canonical gospels, but must rather have been the primitive evangelical records out of which the canonical gospels were formed; but it cannot be said that the criticism of Baur and his followers, in spite of its profound and searching character, has seriously imperiled the claim to apostolic antiquity put forth on behalf of the New Testament scriptures.

Nevertheless, the idea of a strict and pure New Testament canon (see CANON) is not discernible in the church in Justin Martyr's time. There is no positive evidence in favor of its existence; but this is not to be wondered at, for the consciousness of freedom in the Holy Spirit, which penetrated the Christians of the 1st c.; the opposition of what in continental theology are termed the Petrine and Pauline (q.v.), i.e., the Judaizing and anti-Judaizing parties, which does unquestionably appear to have existed; the still living tradition of the apostles; the difficulty of diffusing apostolic writings sent only to particular churches; the absence of criticism; the vacillation in determining the point where the apostolic men ceased; the use in the worship of God of the Old Testament, and, in particular churches, of casual Christian writings not now looked upon as canonical: all these causes together operated in hindering, till the middle of the 2d c., a formal collection of New Testament writings of any compass or critical value, though it seems quite clear that they existed separately, and were regarded as the most authoritative records of the new dispensation. The earliest trace of such a collection (the ten Pauline epistles without the pastoral epistles) appears after the middle of the 2d c. in opposition to that gnostic perversion of primitive Christianity which had been introduced by Marcion of Pontus. The *Muratorian Canon* in the west, and the *Peshito* (q.v.) in the east, both belonging to this period, which has been called the "age of the apologists," furnish important evidence in regard to the New Testament canon, for both refer to nearly every book now received as authoritative, the exceptions being, in the former, the Epistle of James, the Epistle to the Hebrews, and 2 Peter; in the latter, Jude, 2 Peter, 2 and 3 John, and the Apocalypse. In the close of the 2d, and in the beginning of the 3d c., Irenæus, Clemens Alexandrinus, and Tertullian bear testimony to the recognition of the four gospels, the Acts of the Apostles, the thirteen Pauline epistles, the 1st Epistle of Peter, the 1st Epistle of John, and the Apocalypse, as canonical writings. But they do even more than bear testimony to their recognition—they appeal to antiquity for proof of the authenticity of the books which they used as Christian Scriptures. On this point, Tertullian is especially precise, and his most convincing argument on behalf of the "surety of the gospels" is, that "the very heretics bear witness to them." They did not, it is admitted, acknowledge the whole of the New Testament canon, but this is explicable on the hypothesis, which is justified by investigation, that the portions rejected were those that seemed alien to their own opinions. Two distinct collections of writings are now noticed—the *Instrumentum Evangelicum*, containing the four gospels; and the *Instrumentum Apostolicum*, containing the Acts of the Apostles, along with the Pauline and other epistles. Respecting several parts of the New Testament canon, differences of opinion prevailed in early times, nor was the war of criticism closed until the 6th c., for considerable difference of opinion existed in regard to the value of the testimony of the early apologetic authors. Origen doubted the authority of the Epistle to the Hebrews, of the Epistle of James, of Jude, of the 2d of Peter, and the 2d and 3d of John; while, at the same time, he was disposed to recognize as canonical certain apocryphal scriptures, such as those of Hermas and Barnabas, which were decidedly rejected by the church. The Apocalypse was treated as a dubious part of the canon down to the 7th century. The learned and circumspect father, Eusebius, in the 4th c., in a passage of his *Church History*, distinguishes three classes of the New Testament Scriptures: 1. Universally received Scriptures (*homologoumena*), the four gospels, the Acts of the Apostles, the fourteen Pauline epistles, the 1st Epistle of John, the 1st of Peter, and, with a certain reservation, the Apocalypse of John. 2. Scriptures not uni-

versally received, or not received at all. These he calls "disputed" (*antilegomena*), and subdivides them into such as were generally known and approved by most—viz., the epistles of James, Jude, 2 Peter, 2 and 3 John; and such as were "spurious" (*notha*)—viz., the Acts of Paul, the Shepherd, the Apocalypse of Peter, the Epistle of Barnabas, the Institutes of the Apostles, and the Gospel of the Hebrews. 3. Heretical forgeries, such as the gospels of Peter, Thomas, Matthias, which Eusebius pronounces to be "altogether absurd and impious."

The western church, which was more conservative and less critical than the eastern church, completed the canon with greater rapidity. Although the eastern council of Laodicea (360–364), in determining the canon of the New Testament, excluded the Apocalypse, the western synods of Hippo-Regius (393) Carthage (397), the Roman bishop, Innocent I. (in the beginning of the 5th c.), and the *Concilium Romanum* under Gelasius I. (494), recognized the entire canon of the New Testament as we find it in the present day. The doubts entertained by individuals respecting some parts of the canon had become exceptional and unimportant at the close of the 7th century. Owing to the want of Greek scholarship, as also, perhaps, to the growing idea of an infallible church papacy, there was no criticism worthy of the name during the middle ages. Doubts, therefore, respecting the Epistle to the Hebrews and the epistles of James and Jude were first revived, after a long quietude, at the time of the reformation. Erasmus denied the apostolic origin of the Epistle to the Hebrews, 2 Peter, and the Apocalypse. Luther ventured to declare the Epistle to the Hebrews and the Apocalypse "apocryphal." Melanchthon, Gerhard, and Chemnitz went in the same direction, and even Calvin denied the Pauline authorship of the Epistle to the Hebrews. But biblical criticism, for reasons both political and ecclesiastical, soon became dormant, and so remained for nearly two centuries, when it was revived by a liberal Catholic writer, Richard Simon (died 1712), who first conceived the plan of "an historico-critical introduction" to the B.; afterwards, the labors of Lowth, Semler, Herder, Griesbach, Michaelis, Eichhorn, and others, gave a new impulse to scriptural exegesis. In Germany, we may name among writers on the conservative and orthodox side, the Catholic divines Jahn and Hug, with the Protestant writers, Hengstenberg, Hävernick, Guerike, Delitzsch, and Caspari: on the other side, Berthold, De Wette, Credner, Reuss: and since the publication of the *Life of Jesus* by Strauss, the "New Tübingen school," with F. Baur (q.v.) at its head, has questioned the authenticity and apostolical antiquity of all the New Testament Scriptures, except the four larger epistles of Paul—to the Romans, the Corinthians (1st and 2d), and the Galatians. The critical labors of Ewald (especially on the Old Testament), of Hilgenfeld, and of Keim have exerted important influence.

But, as might have been expected, the effects of the strife could not always remain confined to Germany. They have been felt more or less over all Protestant countries—England, Holland, and America—and even Catholic France, which has no theology to contend for, shows the influence of the new movement. Renan (q.v.), who in his *Vie de Jésus* excited a vivid sensation, has followed up his first work by a series of volumes on the early history of Christianity. In England, during the 18th c., several valuable apologetic works were published, such as Lardner's *Credibility of the Gospel History*, and Paley's *Horæ Paulinæ*. In the early part of the 19th c. appeared Horne's *Introduction to the Study of the Scriptures*, which has been frequently reprinted. Since then, Tregelles, Davidson, Westcott, and numerous other scholars, have entered the field; and it is not too much to affirm, that, among the more earnest class of British theologians, there exists at this moment a keener spirit of impartial inquiry, as regards the foundations of biblical criticism, than Britain has ever previously witnessed. The practical tendencies of the Anglo-Saxon mind long restrained it from interfering in what seemed to be a mere maze of unprofitable speculation; but now that its deep and vital relations to the groundwork of men's actual and possible beliefs have begun to be felt, these very practical tendencies are manifestly asserting themselves, and we may confidently anticipate that a large measure of attention on the part both of the clergy and laity will soon be given to this most important of all branches of knowledge.

EDITIONS OF THE BIBLE: HISTORY OF THE TEXT.—As both the Old and the New Testament were written in ancient languages, and transcribed in times when philological criticism hardly existed, the examination and comparison of various editions, with a view to obtain the greatest possible purity of text, forms an important part of theological study.

Text of the Old Testament.—The first duty of an impartial critic of this question is to lay aside both of the extreme and untenable opinions regarding the Hebrew text of the Old Testament, viz.—1st, that it has come down to us in an absolutely faultless condition, by miraculous preservation; and 2d, that it has been willfully and unscrupulously falsified by the Jews. That there are erroneous readings, nobody doubts. The real task devolving on a student of this branch of theological science is to explain these on natural principles, and, by collating the various recensions, to endeavor to obtain a pure text, or as close an approximation to that as may be possible. The following is a tolerably complete classification of the causes of errors. 1. Errors arising from *imperfect sight* or *occasional inattentiveness;* as when transcribers substituted one letter for another similar in appearance, transposed letters, words, and sentences, and omitted the same; of which there are various examples. 2. Errors arising from *imperfect hearing*, of which

there are not many examples. 3. Errors arising from *defective memory;* as when a transcriber fancied that he knew certain words, phrases, or clauses, on account of their having occurred before; of these there are occasional examples. 4. Errors arising from *defective judgment;* as when words were wrongly divided, or abbreviations wrongly resolved; also from the *custodes linearum* (i.e., the letters which filled up the occasional vacant space at the end of lines) and marginal remarks being sometimes incorporated with the text. These not unfrequently happen. 5. Errors arising from a *well-meant desire* on the part of the transcriber to explain or amend a text, really or apparently obscure. In this respect the Samaritans are greatly to blame. A very knotty point is the condition of the text before and at the close of the canon. The opinion of Eichhorn, De Wette, and others is, that while the books circulated singly in a sphere of uncertain authority, they were greatly corrupted; in support of which, considerable evidence is adduced, but still the probabilities are, on the whole, against such a supposition, and it is better to suppose that the conflicting accounts of the same events which are to be met with, especially in the historical books, arise not from the carelessness or corruptions of copyists, but rather from the original authors or compilers having consulted differing documents.

From recent investigations, it appears clear that the strict dogmatic Jews of Palestine and Babylon were generally far more careful in their preservation of sacred records than the Samaritans and the Alexandrines, the latter of whom were remarkable for their free, philosophizing, non-textual spirit. In the schools of learning in Jerusalem at the time of Christ, presided over by Hillel, who had come from Babylon, and Shammai, and in those which flourished elsewhere in Palestine, after the fall of the metropolis, for instance, at Lydda, Cæsarea, Tiberias, etc., as also in the academies of Sora, Pumpeditha, and Nahardea, near the Euphrates, at a later period, the text of the Old Testament was defined with great care, first by the Talmudists, who seem to have adhered very closely to the ancient text, and after the completion of the Talmud at the close of the 5th c. by the *Masorites.* See MASSORAH. This care was at first bestowed only on the consonants of the Hebrew text. The Masoretic vowel system, which sprang from that already existing among the Syrians and Arabians, was developed from the 7th to the 10th centuries at Tiberias. By the 11th c. it appears to have been completed, while the Spanish rabbis of the next century seem ignorant of its then recent origin. (For proof of this, see Davidson's *Text of the Old Testament Considered,* 1856.) After the 11th c., the Masoretic text, with its perfected system of vowels and accents, became the standard authority among Jewish scholars. The comparative values of the different readings in the various MSS. had by that time been carefully determined, and the chief business of copyists, henceforth, was to make faithful transcripts.

The earliest printed editions of the Hebrew B. bear a close resemblance to the MSS. "They are without titles at the commencement, have appendixes, are printed on parchment with broad margin, and large ill-shaped type, the *initial* letters being commonly ornamented either with wood-cut engravings or by the pen. These letters, however, are often absent. With vowels, the editions in question are very imperfectly supplied. Separate parts of the B. were first printed." ThePsalms appeared in 1477, probably at Bologna; the Pentateuch at Bologna in 1482; the Prophets in 1486; the Hagiographa in 1487. To most of these were subjoined the rabbinical commentary of Kimchi. The whole of the Old Testament appeared in small folio at Soncino, 1488, and appears to have been followed by the edition of Brescia (1494), which was used by Luther in his translation of the Old Testament. The *Biblia Polyglotta Complutensia* (1514–17), the *Biblia Rabbinica* of Bomberg, edited by Rabbi Jacob-Ben-Chajin (Venice, 1525–26), which has been adopted in most of the subsequent editions—the Antwerp *Biblia Polyglotta* (8 vols., 1569–72), also the editions by Hutterus (Hamburg, 1587, and frequently reprinted), Buxtorf (Basel, 1611), and especially that by Jos. Athias (Amsterdam, 1661–67)—all these are celebrated, and have supplied the basis of later editions by Simon, Hahn, Theile, and others. In the 17th c., a vehement controversy arose regarding the integrity of the Hebrew text; one party maintained that the Masoretic text was greatly corrupted, and contrasted it unfavorably with that of the Samaritan Pentateuch. The chief advocates of this view were Vossius, Whiston, Morin, and Capellus. On the other hand, Buxtorf, Arnold Bootius, Wasmuth, and others, defended the absolute purity of the Masoretic text, even to the inspiration of the vowel-points, which Buxtorf, in the preface of his grandfather's *Tiberias,* gravely asserts to have been first invented by Ezra. This controversy had at least one good result. It led to an extensive examination of Hebrew MSS. in the next century. Kennicott collated 630, 258 throughout, the rest in part; De Rossi, 751, of which all but 17 were collated for the first time. Many still remain uncollated. The result of this elaborate investigation has been to convince scholars that the Masoretic text is substantially correct. All known codices confirm it; the oldest of the professedly literal versions, as well as the Targums of the time of Christ, furnish similar satisfactory evidence; and when we consider the *bibliolatrous* tendencies of the Jews *after* their return from exile, whatever may have been the case before, we may safely conclude that we now possess the text of the Old Testament much in the same condition as it was at the close of the canon.

At first, there were no intervening spaces between Hebrew words; afterwards, small intervals appear to have been occasionally allowed. With the introduction of the *square*

character, the use of small interstices to separate words became general. The Talmud prescribes how much space should be between words in sacred MSS. designed for the synagogue. Various divisions according to the sense were also introduced at an early period. In the Pentateuch there were two, termed respectively *open* and *closed*. The former were intended to mark a change in the matter of the text; the latter, slight changes in the sense. Of these, the Pentateuch contained 669, named *parshioth* (sections). This division is probably as old, or nearly so, as the practice of reading the Law. It is found in the Talmud, while the division into 54 *great parshioth* is first found in the Massorah, and is not observed in the rolls of the synagogues. The poetical books were also subjected, from a very early period, to a stichometrical division, according to the peculiarities of Hebrew versification. In order to facilitate the reading and understanding of the prose books, a division into logical periods was also made, which is mentioned in the *Mishna* (q.v.), while in the *Gemara* (q.v.) its authorship is ascribed to Moses. From it sprang our present division of the Scriptures into verses. It is highly probable that these divisions were long handed down orally. Our present division of the Old Testament into chapters is a later invention, and, though accepted by the Jews, is of Christian origin: it may be dated as far back as the 13th c., some assigning it to Cardinal Hugo, others to Stephen Langton, archbishop of Canterbury. It was first employed in a concordance to the Vulgate, whence it was borrowed by Rabbin Nathan in the 15th c., who made a similar concordance to the Hebrew Bible. Nathan's divisions are found in Bomberg's Hebrew B. of 1518. Verses were first introduced into editions of the Hebrew B. by Athias of Amsterdam, 1661, but were employed in the Vulgate as early as 1558. The first *English* B. divided into verses was published at Geneva in 1560.

New Testament.—The original MSS. of the New Testament were probably all written on papyrus, the cheapest, but least durable material that could be obtained for the purpose. It was therefore impossible, considering the constant handling to which the documents must have been subjected by the eager converts, that they could have lasted for any length of time. Indeed no authentic notices of them have come down to us, and it is a curious fact that, in the controversies of the 2d c., no appeal is made to the apostolic originals. But the number of copies was very great. The text of these, however, did not always agree. Variations originated, to a considerable extent, from the same causes as operated in the case of the Old Testament, viz., imperfect vision or hearing, misunderstanding, carelessness, or an uncritical judgment on the part of transcribers; but it is natural to suppose that, on account of the greater freedom of spirit and thought which characterized primitive Christianity, compared with Judaism, a latitude of conviction in regard to the value of the *letter* of Scripture, also influenced the churches. The *idea* of inspiration (q.v.), it is now admitted by the most enlightened theologians, was progressively developed. In the earliest ages it did not exist in any dogmatic form whatever. Christians were content to believe that the evangelists and apostles spoke *truth*, by the help of the Holy Spirit, without perplexing themselves with the question, whether the words were purely divine or purely human in their origin. They had a gospel to preach, and a world to convert, and were therefore not in a mood to discuss mechanical notions. This also must have operated in producing the textual variations referred to, many of which are of such a nature as to clearly prove that the commentators or transcribers thought themselves at liberty to alter or improve the expression. Nor must we overlook the fact, that the different culture and tendencies of the eastern and western churches also caused very considerable changes. Modern criticism reckons no less than 80,000 variations in the existing MSS. Nevertheless, one fact stands out, solid and imperishable, amid all the tiny fluctuations of verbal criticism, viz., that, with one or two exceptions, no material difference exists, or in all probability ever did exist, in New Testament MSS. The *general* Christian consciousness, which was the real guardian of their integrity, had been grounded too deeply in the facts, doctrines, and ethics of a historic Christianity to follow in the wake of sectarian or heretical modifications of the truth. It instinctively turned, as it were, from a sense of affinity to those apostolic records, the tone of which most closely corresponded to its own spiritual character and development, and thus unconsciously prevented any incongruous changes from being effected in the mass of MSS. Of these MSS., upwards of 1400 are known to scholars, and have been collated, and no essential discrepancy has been detected. Of course, it can be urged that all the MSS. belong to a period when the church had gathered itself up into two great wholes—the Latin and Greek, and when, therefore, a general conformity in MSS., as in other things, is only to be expected; but the fragments which are found in the earliest church fathers exhibit substantially, though not verbally, the same text, and we may therefore fairly infer that this unintentional harmony in part argues the general harmony of the earlier and later MSS.

Some slight attempts seem to have been made, during the early history of the church, to obtain a correct text. One Lucian, a presbyter of Antioch, and Hesychius, an Egyptian bishop, are said by Jerome to have undertaken a recension of the New Testament, and both Origen and Jerome himself were of considerable service in this respect. It is to modern criticism, however, that we owe almost everything in regard to the regulation of the text. Bengel and Semler first started the idea of arranging the MSS. of the New Testament into *families* or *classes*. After these came Griesbach, who, following out the idea, propounded his famous threefold division of the MSS. into Western, Alexandrian,

and Byzantine. The first two he considers the oldest; the third, a corrupt mixture of both. Griesbach himself preferred the Alexandrian: he believed that the Byzantine transcribers had taken great liberties with the text, and held that a few Alexandrian MSS. outweighed, in critical value, a large number of the other. The accuracy of Griesbach's division has subsequently been questioned by many eminent German scholars, each of whom has in turn favored the world with a theory of his own in regard to the probable value of the various families of MSS. Recently, Lachmann has applied, with excessive strictness, a principle first hinted by Bentley, viz., that no weight ought to be attached to any MSS. except those written in the old or uncial (q.v.) character. The exact value of each manuscript is still a matter of dispute; but a great deal has been done to place the knowledge of the various lines of evidence within the reach of all scholars. Tischendorf carefully examined the most important of the uncial MSS., and published them separately somewhat after the fashion of a fac-simile. He also published a fac-simile of the *Codex Sinaiticus*, which he found in a monastery in Mt. Sinai. Scrivener has collated a considerable number of cursives, and collated again the *Codex Bezæ*. And great attention is being paid to quotations from the fathers. Rönsch, for instance, has given all the quotations from the New Testament in Tertullian, and Tischendorf made large use of them in his last or eighth edition.

The whole of the New Testament was first printed in the Complutensian Polyglott, 1514. From 1516 to 1535, five editions appeared at Basel, under the care of Erasmus, but without any great pretensions to critical accuracy. The subsequent numerous editions were, for the most part, either founded on the editions of Erasmus or on the Complutensian, or on a collation of both. Among these editions we may mention those of Simon de Colines or Colinæus (Paris, 1543), of the elder Stephen (1546, 1549, and 1550), of the younger Stephen (1569). Beza was the first who, by several collations founded on the third edition by Stephens, made any considerable progress in the critical treatment of the text, and thus supplied a basis for the present received text (*textus receptus*), which was first printed by Stephens with the Vulgate and critical annotations at Geneva, 1565; afterwards was frequently reprinted by Elzevir (Leyden, 1624) and others. The labors of the English scholar, Walton, in the London Polyglott (1657), of Fell (Oxford, 1675), and especially Mill (Oxford, 1707), were of great importance for the criticism of the New Testament. Bengal exhibited great tact and acumen in his edition of 1734, Wetstein much industry and care in the editions of 1751–52, as also Semler, 1764. But all these recensions were surpassed in value by the labors of Griesbach (1st ed. 1774; 2d and best ed. 1796–1806). The more recent contributions to the criticism of the New Testament by Scholz, the *Lucubratio Critica* (Basel, 1830), and the critical edition by Rinck (2 vols., Leip. 1830–36), the edition by Lachmann (Berl. 1831), with especial use of oriental MSS., and, subsequently, the labors of Buttmann (1842–50), Tregelles, (1854–63), Tischendorf, (1841–73), and Scrivener (1861), are also worthy of high praise.

Among the MSS. of the New Testament, the oldest are not traced back further than the 4th c., and are written in the so-called *uncial* characters. The modern MSS., dating from the 10th c. downwards, are distinguished by the *cursive* characters in which they are written. The most important MSS. are the *Codex Sinaiticus* (at St. Petersburg), the *Codex Alexandrinus* (in the British museum), *C. Vaticanus* (in the vatican at Rome), *C. Ephræmi* (in the imperial library at Paris—a fac-simile of which was edited by Tischendorf, Leip. 1843), and *C. Cantabrigiensis*, or *C. Bezæ* (given by Beza to the university of Cambridge, a fac-simile being issued by Th. Kipling, 1793). Of these, the *Codex Vaticanus* was long considered to be the oldest, but the discovery of the *Codex Sinaiticus* by Tischendorf at the monastery of St. Catharine, Mt. Sinai, in 1859, has now transferred the honor to that invaluable document, the age of which cannot be older than the middle of the 4th century. A fac-simile of the *Codex Vaticanus*, edited by cardinal Mai, was published at Rome in 1858.

The earliest division of the New Testament into verses of which we read is that made by Euthalius, deacon of Alexandria, 462 A.D. He arranged those words that were related to each other by the sense into *stichoi* or lines. Subsequently, to save space, a colon or point was substituted, until, finally, a complete system of punctuation arose. In the 13th c., as we have already seen, the division into chapters took place, and in the 16th the versicular division was perfected by Stephens. The arguments or contents prefixed to the several chapters are also of modern origin.

B. Versions or Translations.—These may be divided into ancient and modern. The *ancient translations* of the Old Testament from the original Hebrew may be classed as follows: 1. *Greek.*—The earliest of these is the Alexandrine or Septuagint (q.v.), after which come respectively the translations by Aquila (q.v.), Theodotion, and Symmachus. The whole of these, with fragments of others by unknown authors, were given by Origen in his *Hexapla* (q.v.). The *Versio Veneta*, a Greek translation of several books of the Old Testament, made in the 14th c., and preserved in the St. Mark's library, Venice, was published by Villoison at Strasburg, in 1784. Several early versions were also based on the Septuagint; but for that reason do not possess an independent value, being for the most part simply translations of a translation. Among these may be mentioned the old Latin version or *Italic* (q.v.), though the term *Italic* is strictly applicable to the New Testament only, improved by Jerome (382 A.D.): the Syriac, including the *Versio Figurata*, partially preserved and collated by Jacob of Edessa, in the beginning of the 8th c.;

and that by Paul, bishop of Tela (617 A.D.): the *Ethiopic*, made by certain Christians in the 4th c.: the threefold *Egyptian* (3d or 4th c.), one being in the language of lower Egypt, and termed the *Coptic* or *Memphitic;* another in the language of upper Egypt, and termed the *Sahidic* or *Thebaic;* and a third, the *Basmuric*, whose locality is uncertain: the *Armenian*, by Miesrob and his pupils in the 5th c.: the *Georgian*, of the 6th c.: the *Slavonian*, commonly ascribed, but for unsatisfactory reasons, to the missionaries Methodius and Cyrillus in the 9th c.: the *Gothic*, ascribed to Ulphilas, and executed in the 4th c., only some few fragments of which are extant: *lastly*, several Arabic translations of the 10th and 11th centuries.—2. The *Chaldaic translations* or *Targums*. These had an early origin; but, with the exception of those of Onkelos and Ben Uzziel, are unsatisfactory in a critical point of view. See TARGUM.—3. The remarkably literal translation into the Aramaic dialect of the later Samaritans, of the ancient copy of the Pentateuch, possessed by the Samaritans (see SAMARITAN PENTATEUCH).—4. The church translation, known as the *Peshito* (q.v.), received by all the Syriac Christians. It was undoubtedly executed from the original Hebrew text, to which it closely adheres. Several Arabic versions were founded on the *Peshito*.—5. The later Arabic versions, executed during the middle ages, partly from the Hebrew text, and partly from the Samaritan Pentateuch.—6. The Persian translation of the Pentateuch, made by a Jew named Jacob, not earlier than the 9th century.—7. The Latin Vulgate (q.v.), from which a considerable number of fragmentary versions were made into that form of English commonly called Anglo-Saxon, the most noted translators being Adhelm, bishop of Sherborne, and Bede (8th c.); Alfred (9th c.); and Ælfric (10th c.).

Among ancient versions of the New Testament we may notice three in Syriac: the first is the *Peshito*, with a twofold secondary translation of the four gospels into Arabic and Persian. It does not, however, contain 2d Peter, 2d and 3d John, Jude, or the Apocalypse, which at a later period were classed among the *antilegomena*, or disputed books. The second, or *Philoxenian*, prepared in 508 under the direction of Philoxenius, bishop of Hierapolis. It no longer exists, but a counterpart of it does, in the translation made in the following century (616 A.D.) by Thomas of Harkel or Heraclea, the successor of Philoxenius. The best MS. of this version is one which belonged to Ridley, and is now in the archives of the New college, Oxford. It includes all the books of the New Testament excepting the Apocalypse. The style is slavishly literal. It was edited by White, Oxford, 1778. The third, or Jerusalem-Syriac version, preserved in a Vatican MS., and, according to the subscription annexed to it, executed at Antioch in 1031. With the above Syriac version we may class the Ethiopic translation; the Egyptian threefold version, made probably in the latter part of the 3d c., and of considerable critical value; the Armenian, Georgian, Persian, and Coptic-Arabic. Besides these may be mentioned the old Italic; the Vulgate by Jerome; the Gothic translation by Ulphilas (about the middle of the 4th c.), of which the most famous MS. is preserved in the library of Upsal, in Sweden (this has only the four gospels, and not even these in perfect condition); the various Anglo-Saxon versions already mentioned in connection with versions of the Old Testament; and the Slavonic.

Modern Translations.—During the middle ages, when the laity were considered by the priesthood unfit to be intrusted with the B. as a whole, various poetical versions—such as the gospel history, by Otfried von Weissenburg, and the version of Job and of the Psalms by Notker-Labeo (980 A.D.)—served a very important object, and stimulated the desire for more biblical information. As early as 1170, Petrus Waldus caused the New Testament to be translated into Provençal dialect by Etienne d'Anse. This important work was followed by the translations made under Louis the Pious (1227) and Charles the Wise (1380), the B. histories (*Bible ystorieus*) by Guyars of Moulins (1286), the Spanish version under Alfonso V. in the 13th c., the English by Wickliffe, and the Bohemian version of John Huss. After the invention of printing—especially after the latter part of the 15th c.—the harbingers of a new ecclesiastical era appeared in numerous republications of the translated B.—the Bohemian (Prague, 1448); the Italian, by the Benedictine Nic. Malherbi (1471); the French, by Des Moulins (1477–1546); the Dutch (Delf, 1477); the Spanish (1478–1515); but, above all, in the 17 German translations before Luther, of which 5 were printed before 1477, and the remainder in the low German dialect during 1477–1518.

Luther's translation of the B. is universally esteemed by the best German scholars as a masterpiece of genial interpretation. It displays qualities far superior to those ordinarily expected in a translation—deep insight, true sympathy with the tone of the Hebrew Scriptures, and a perfect command of clear, popular language; indeed, every one who can thoroughly appreciate the merits of this great work, will be ready to excuse the boldness of the assertion, that "it is rather a re-writing than a mere translation of the B.," a transfusion of the original spirit into a new language, rather than a mere version of the latter. The New Testament was finished by Luther at Wartburg, and appeared in Sept., 1522. In the following year, the five books of Moses appeared; and, in 1534, the remaining part of the Old Testament canon was completed along with the Apocrypha. With wonderful rapidity this translation was circulated throughout Germany. In the course of forty years, one bookseller, Hans Luft of Wittenberg, sold 100,000 copies; an astonishing number, when we consider the price of books in the 16th century. It was reprinted 38 times in Germany before 1559, and meanwhile the New

Testament had been separately printed in 72 editions. Numerous other translations in Dutch, Swedish, etc., were based upon the work of Luther.

English Translations.—Wycliffe (q.v.) executed a noble version from the Vulgate, but it was long before our country began to print even portions. Long after Germany and other countries had issued vernacular versions of the B., that land continued to sit in darkness. The earliest attempt was a translation of the *seven penitential psalms* in 1505. No doubt, a very considerable number of MSS. circulated among the people; but still we may well ask: "What were these among so many?" Such a question the noble martyr, William Tyndale (q.v.), seems to have put to himself, and bravely he answered it, vowing that "if God would spare his life, ere many years he would cause the boy who driveth the plough to know more of the Scriptures than did all the priests." To accomplish his purpose, he passed over to the continent. Before 1526, he had completed an English translation of the New Testament, which appeared both in quarto and duodecimo. In the beginning of 1526, the volumes were secretly conveyed into England, where they were bought up and burned, which, however, only stimulated Tyndale to greater exertions. Of the admirable character of his translation, we have a sufficient testimony in this fact, that in our present version a very large portion of the New Testament is taken almost *verbatim* from Tyndale's Testament. Tyndale next proceeded to prepare a version of the Old Testament out of the original Hebrew, and in 1530, he published the Pentateuch, and in the following year, the book of Jonah. The first English version of the whole B. was that published by Miles Coverdale, a friend of Tyndale. It is dated 1535, and dedicated to Henry VIII., but where printed, is unknown. It is much inferior to Tyndale's. The next English B. issued was called *Matthew's B.*, from the circumstance that the editor assumed the name of Thomas Matthew, but was simply Tyndale's version revised by his friend John Rogers, who also translated those books in the Old Testament which the martyr had not been able to overtake. It was finished in 1537, and Cranmer obtained for it the patronage of Henry, though that monarch had persecuted Tyndale some years before. Matthew's B. soon superseded Coverdale's. In April, 1539, appeared the *Great B.*, usually called Cranmer's, because he wrote a preface to it. It was a large volume for use in churches. The text was Tyndale's revised. In the same year, Richard Taverner, a learned but eccentric layman belonging to the Inner Temple, published an edition, the text of which is based on that of Matthew's Bible. In 1557 appeared the famous *Geneva B.*, so called because the translation was executed there by several English divines, who had fled from the persecutions of the bloody Mary. Among these may be mentioned Gilby and Whittingham. This edition—the first printed in Roman letter and divided into verses—was accompanied by notes, which showed a strong leaning to the views of Calvin and Beza. It was, in consequence, long the favorite version of the English Puritans and the Scotch Presbyterians. It is, however, best known as the *Breeches B.*, on account of the rendering of Genesis iii. 7: "Then the eyes of them both were opened, and they knew that they were naked, and they sewed fig-tree leaves together, and made themselves *breeches*." In 1568, the *Bishops' B.* was published at London. The text of this was compared with the original by eight bishops, and seven other scholars of reputation, who appended their initials to their respective tasks; the whole being under the superintendence of Matthew Parker, archbishop of Canterbury. In 1582 appeared at Rheims, in France, an English version of the New Testament, prepared by several Roman Catholic exiles; and in 1609–10, a similar version of the Old Testament at Douay. Both were taken from the Vulgate, and form the standard English Scriptures of the Roman Catholics, being generally known as the *Douay Bible.*

We now come to the version which has been in common use for nearly 250 years, generally called *King James's Bible.* At the Hampton court conference in Jan., 1604, Dr. Rainolds, an eminent Puritan, suggested a new translation as a great national want; and this, though opposed by the bishop of London, was sanctioned by the king. Arrangements were at once made for carrying out the project. In July, the king wrote a letter, intimating the appointment of 54 scholars for the preparation of the version, and instructing the bishops that whenever "a living of twenty pounds" became vacant, they should inform his majesty of the circumstance, in order that he might recommend one of the translators to the patron. This was all that James did on behalf of the translation which bears his name. The expenses seem to have been borne by Barker, the printer and patentee, who paid the sum of £3500. Of the 54 scholars who had been nominated to the work, only 47 undertook it. These were divided into six companies, two of which were to meet at Westminster, two at Cambridge, and two at Oxford. The *first* company at Westminster translated the Pentateuch and the historical books to the end of 2d Kings; the *first* at Cambridge, from the beginning of Chronicles to the end of Canticles; and the *first* at Oxford undertook the remaining books of the Old Testament canon. The second company at Westminster translated the apostolic epistles; the second at Cambridge, the Apocrypha; and the second at Oxford, the gospels, the Acts of the Apostles, and the Apocalypse. According to Selden, "they then met together, and one read the translation, the rest holding in their hands some B., either of the learned tongues, or French, Spanish, Italian, etc. If they found any fault, they spoke; if not, he read on." When a portion was finished by one of the company, it was sent to all the others in succession for their deliberative examination; and whenever a difference of opinion was elicited, reference was made to a committee. The final revision of the whole was conducted in

London by two delegates from each of the six companies. These twelve scholars, in the discharge of their critical functions, met daily in the old hall of the stationers' company for nine months. The work of translation and revision occupied from 1607 to 1610. The superiority of the authorized version soon proved itself; for though there were several rivals in the field, and no steps were taken to secure for it a preference, it quickly gained the foremost place, and in the course of forty years from its publication, all others had quietly succumbed to it; it became, and has ever since remained *the English Bible*. Its ascendency, and its exclusive use among all classes in Great Britain, and in her vast colonies, can only be traced to its intrinsic excellence. A new English version, however, has been in course of preparation for some years.

The exclusive right to print the present authorized version has been claimed by the crown, ever since the date of its first publication, and under this royal prerogative, the B. is printed in different forms, and sold wholesale by certain patentees and licensees in England, Scotland, and Ireland. This claim, which does not practically affect Bibles with notes, has lately been much demonstrated against as a monopoly injurious to the free circulation of the Scriptures at a moderate price, and a modification is now looked for (see BOOK TRADE).

The more liberal Catholics—especially the Jansenists De Sacy, Arnauld, and Nicole; the enlightened Richard Simon and Quesnel—also shared in the common zeal for diffusing a knowledge of the Scriptures; but though many versions have been prepared by Catholics, the Romish church has consistently maintained an opposition to the general circulation of Holy Scripture without ecclesiastical comments.

The numerous recent translations of the Scriptures into languages beyond the pale of Christendom, have been executed chiefly under the auspices of missionary and bible societies (q.v.).

As to the *contents* of the B., its one grand object, under whatever form it may appear in the various books, is, to give an account of this world, both in its origin and government, as the work of an Almighty Creator, always and everywhere present; and especially to exhibit the relation of man to this Creator, and, in consequence of that relation, in what manner and with what hopes he ought to live and die—subjects undeniably the most momentous that can occupy human thought. The sacred books of other religions have all an analogous aim; to account, namely, for the origin of all things, and to explain the nature and human relations of that something *divine*, which it is an instinct of the human mind to conceive as actuating and controlling all that moves. But so different, so immeasurably superior to all other sacred books is the B. in the conception it unfolds of the divine nature as one personal God, exercising towards men the love and care of a parent to his offspring, and in the system of human duties springing therefrom, that on this consideration alone many rest its claim to being received as a direct revelation from heaven. The questions regarding the B., considered in this point of view, fall to be treated under the heads of INSPIRATION and REVELATION. To attempt to analyze or give any detailed account of the contents of the Scriptures, is beyond the scope of this article. The leading features of the doctrines and precepts, as a system, will be briefly sketched under the head of CHRISTIANITY; while the chief individual doctrines receive notice under their respective names, and in the accounts of the controversies to which they have given rise.

BIBLE, CURIOUS EDITIONS OF. Besides those issues of the book which have historical importance are those notable for curious errors, or for incidents of publication. The following is a list of the more familiar of these, with their peculiar designations:

THE GUTENBERG BIBLE.—The earliest book known, printed from movable metal types, is the Latin Bible issued by Gutenberg, at Mentz, A.D. 1450.

THE BUG BIBLE.—So called from its rendering of Psalms, xci.: 5: "Afraid of bugs by night." Our present version reads, "terror by night." A.D. 1551.

THE BREECHES BIBLE.—The Geneva version is sometimes called the Breeches Bible, from its rendering of Genesis, iii.: 7: "Making themselves breeches out of fig-leaves." This translation of the Scriptures—the result of the labors of the English exiles at Geneva—was the English Family Bible during the reign of queen Elizabeth and till supplanted by the present authorized version of king James I.

THE PLACE-MAKERS' BIBLE.—From a remarkable typographical error which occurs in Matthew, v.: 9: "Blessed are the place-makers," instead of peace-makers. A.D. 1562.

THE TREACLE BIBLE:—From its rendering of Jeremiah, viii.: 22: "Is there no treacle [instead of balm] in Gilead?" A.D. 1568.

THE ROSIN BIBLE.—From the same text, but translated "Rosin" in the Douay version. A.D. 1609.

THE HE AND SHE-BIBLES.—From the respective renderings of Ruth, iii.: 15—one reading that "She went into the city." The other has it that "He went." A.D. 1611.

THE WICKED BIBLE.—From the fact that the negative has been left out of the seventh commandment (Exodus, xx.: 14), for which the printer was fined £300. A.D. 1631.

THE THUMB BIBLE.—One inch square and half an inch thick, was published at Aberdeen. A.D. 1670.

THE VINEGAR BIBLE.—So named from the head line of the 20th chapter of Luke, which reads as "The parable of the vinegar," instead of the vineyard. A.D. 1717.

THE PRINTERS' BIBLE.—We are told by Cotton Mather that in a Bible printed prior to 1702, a blundering typographer made king David exclaim that "Printers [instead of princes] persecuted him without a cause." See Psalms, cxix.: 161.

THE MURDERERS' BIBLE.—So called from an error in the 16th verse of the Epistle of Jude, the word "murderers" being used instead of "murmurers." A.D. 1801.

THE CAXTON MEMORIAL BIBLE.—Wholly printed and bound in 12 hours, but only 100 copies struck off. A.D. 1877.

BIBLE, PROHIBITION OF. This is one of the main points of opposition between the Roman Catholic and the Protestant church. In the earliest times we find no evidence of any prohibition of Bible-reading by the laity. On the contrary, as the foundation on which the church was built, and the sole source of religious knowledge, the reading of the Bible formed an essential part of the instruction communicated by pastors to their congregations; and the greatest orators of the church—especially Chrysostom and Augustine—continually reminded their hearers that private reading and study of the Scriptures should follow attendance on public services. This great fact is by no means contradicted by the warnings found here and there in the fathers against abuse or mistake of the meaning of Scripture; these warnings rather imply that Scripture-reading was common among the laity. The gradual widening of the distinction, or rather the separation, between the clergy and the laity, was the work of the middle ages; and, among other means of preserving traditions inviolate and maintaining the exclusive character and sacred authority of the hierarchy, the Bible was held in the background, even while there was no direct prohibition of its common use. In 1080, Gregory VII. ordained that Latin should be the universal language of Catholic worship, and consequently excluded all vernacular readings of Scripture in public assemblies. Again, with regard to the Waldenses, Innocent III., in 1199, prohibited the private possession and reading of Scripture (excepting the portions contained in the Breviary and the Psalter) without priestly permission and supervision. Similar prohibitions were repeated at Toulouse (1229), at Béziers (1233), and with regard to Wickliffe, at the synod of Oxford (1382). Ultimately, the recognized Latin version, or vulgate, was more and more decidedly made the sole authorized church version. Indeed, as early as 1234, the synod of Tarragona denounced as a heretic any one who, having a translation of the Bible, refused to surrender it to be burned within the space of eight days. As, however, it soon appeared plain that little could be effected by such prohibitions, milder measures were employed. The Tridentine council, being required to pronounce on the question of Bible translations, purposely employed a word of ambiguous meaning in styling the vulgate simply "authentic;" but nothing was determined on Bible-reading among the laity. This was first done in the publication of the first *Index Librorum Prohibitorum* soon after the Tridentine council. Afterwards, the rules of the church, placing the use of the Scriptures under the supervision of the bishops, were more and more strictly defined. The publication of the New Testament with practical annotations by Paschasius Quesnel (1687), gave occasion to the Roman Catholic church to speak more definitely on the reading of the Bible by the laity in the bull *Unigenitus Dei Filius*, 1713. New ordinances were issued by pope Pius VII. in his brief to the archbishop of Gnesen and Mohilew (1816) against translations formerly authorized; again, by Leo XII., in his condemnation of Bible societies (1824), and by Pius VIII. All these ordinances of the Roman Catholic church imply that it is dangerous to give the Bible freely to the laity, and that, therefore, no vernacular versions ought to be used without interpretations taken from the fathers, and an especial papal sanction.

BIBLE, REVISED ENGLISH VERSION. A revision of the English Bible, or "authorized version," has been in progress for about ten years and is now nearly completed. A deep and general interest is felt in the reasons assigned for making this revision, in the nature of the alterations proposed, and in the character and qualifications of the men selected for the work.

I. *The reasons assigned for a revision.*

1. The division into chapters and verses needs to be revised. The division into chapters was made by cardinal Hugo de Sancto Caro, about the middle of the 13th century. The verses of the old testament are of earlier date and Jewish origin. Those of the new testament were made by Robert Stephens, for his edition of the Greek testament published in 1551. The division into chapters was introduced into the earlier English versions; the verses appeared first in the Geneva bible of 1560. As these divisions were hastily made and with a view to convenient reference rather than to an accurate exhibition of the subject matter, it is not surprising that some passages are severed which ought to be connected, and that others are connected which ought to be separate. For example: in Gen. i., the six days of the creative week are cut off from the seventh day; Is. liii. ought to begin with the last three verses of lii.; and Rev. xxii. should yield its first 5 verses to xxi.

2. There are obsolete words which might, with advantage, be exchanged for words in current use. The authorized version has contributed greatly to the permanence of the English language. Yet some words have slipped out of use, notwithstanding its hold upon them. Among these are "wist" not, for *knew* not, or *did not consider;* "eschew," for *shun;* "leasing," for *falsehood;* "broided," for *braided;* "neesing," for

sneezing. Some words that are retained in use have changed their meaning since the translation was made. "By and by" then meant, *immediately*, now it means *after a while;* to "prevent," was to *go before*, now to *restrain;* to "let," was to *hinder*, now to *permit.*

3. Sometimes proper names have been translated as common nouns; in other instances the reverse has been done. "From the tower of Syene unto the border of Ethiopia," should be—from Migdol unto Syene, the border of Ethiopia; "the house of God," should sometimes be translated, Bethel; "populous No," should be, No-Ammon; "a hollow place that was in the jaw," should be—the hollow place that is in Lehi. On the other hand, "the children of Sheth," should be—tumultuous children; "men of Belial"—worthless, wicked men; the "Gammadims" in the towers of Tyre—warriors; "Pannag," not a country, but an article of commerce.

4. Often the disregard of the definite article, both in Hebrew and Greek, has made the translation inaccurate or vague. "There is a feast of the Lord in Shiloh" should be—the feast of the Lord is in Shiloh. David's wondering exclamation in acknowledgment of the promise that in the distant future the incarnate Messiah should be his son, instead of being, vaguely, "Thou hast regarded me according to the estate of a man of high degree," should be—according to the estate of THE MAN, THE EXALTED ONE. In the new testament, "a city which hath foundations," should be—the city which hath the foundations; and, "a good fight" which Paul had fought was—the good fight of faith.

5. In many passages the distinction between tenses of Hebrew and Greek verbs has been neglected or incorrectly rendered. In the old testament the imperfections from this source are most numerous in the poetical and prophetical books. The future is there often translated as the past. "I cried," instead of—I will cry; "the Lord sustained," instead of—will sustain; "God came," instead of—will come; "and made intercession for the transgressors," instead of—and will make. Often the future is rendered as the imperative, so that a confident declaration seems a command or a prayer. Thou wilt not withhold Thy tender mercy, is changed into, "withhold not Thou." Often the prophets seem to be declaring the past when they are foretelling the future. In the new testament similar inaccuracies in translating tenses are found. The continued action expressed by the imperfect, is sometimes disregarded. We find, "their nets brake," instead of—were breaking; "they brought to Him a man sick of the palsy," instead of —were bringing. The completed past of the perfect tense is sometimes translated as a present; "I am crucified with Christ," instead of—I have been; and at other times, by the indefinite past, "anything made that was made," for—has been made; "was counted worthy," for—has been. The indefinite past tense also is translated as a perfect or a present; "death passed upon all men for that all have sinned," instead of—for that all sinned; "we that are dead to sin," instead of—we that died to sin.

6. One and the same original word is often translated by various English words, both in different places and in the same context. On the other hand one and the same English word is sometimes used to express different words in the original. The Divine being who made a covenant with Abraham is called, "the Angel Jehovah;" but when Malachi calls the Lord—the Angel of the Covenant, the translation more vaguely says, "the Messenger of the Covenant." "Blameless" and "guiltless" are used in translation of the same word; so are "everlasting" and "eternal;" "wonder," "admiration," and "marvel;" "goodly" and "gay;" "lust," "coveting," and "concupiscence;" "love" and "charity;" "hope" and "trust;" "happy" and "blessed;" "atonement" and "reconciliation;" "mad" and "beside thyself." We find one Greek word which is expressed by seven English words—"straightway," "immediately," "forthwith," "anon," "as soon as," "by and by," and "shortly." On the other hand one word in the translation sometimes represents very different words in the original. The majestic Nile is pre-eminently "the river of Egypt;" yet the translation gives the same epithet to a comparatively insignificant brook. The opprobrious name "fools" is fastened alike on the atheistic and the inconsiderate; "hell," is used both for the state of the dead and for the place of the wicked in misery; "devil" is the name given both to Satan and to the demons subject to him; the verb "to be" is made to express both the birth of a creature and the eternal existence of the Son of God.

7. The italic words call for revision. The authorized version is remarkable for the abundant use of italic letters, not to mark emphasis, as in other books, but to distinguish words not expressed in the original, yet, as the translators thought, implied in it and rendered necessary by difference of idiom between the ancient languages and our own. They are to be valued as a proof of the honesty and care with which the translation was made. In many instances they are also useful in making the meaning clear. Yet a thorough revision of them is, in the opinion of well qualified judges, greatly to be desired. Many of them are superfluous, since they are fairly implied in the original. Among these are parts of the constantly recurring verb "to be;" and personal, possessive, and relative pronouns, which are plainly implied in the original and necessary to the sense. In Jn. xx. 5, "stooping down *and looking in*," the italics are not required, since the original verb includes both acts in its signification; and in 1 Pet. i. 12, as applied to angels, it is translated "to look into," without any attempt to express the stooping down. "Some *say that thou art* John the Baptist, might better be only—some *say*, John the Baptist; and "*by the space of* 40 years," is simply—40 years. On the other hand, some italic words

have nothing, expressed or implied, in the original to warrant them. "*There is* no speech nor language *where* their voice is not heard," should be only—there is no speech nor language; their voice is not heard. In Jn. viii. 6, "*as though he heard them not,*" is an addition without warrant, undertaking to declare the object of Jesus in writing on the ground when the text gives no intimation of it.

In Matt. xxv. 14, the italics say, "*the kingdom of Heaven is* as a man;" and in Mk. xiii. 34, "*the Son of man is;*" but in both cases it is THE TIME spoken of in the preceding verse that is the object of comparison.

8. Revision is called for by the knowledge concerning the original texts which has been attained since the authorized version was made. The Hebrew text then in use possessed the great advantage of being accepted by Christians and Jews alike. It had been edited by Jewish scholars and watched over from generation to generation with reverent and even superstitious care. New copies were always minutely compared with the old. All errors and variations in words, letters and accents were noted in the margins of the manuscript, but the text itself was never changed, These marginal notes are continued in the printed Hebrew bibles and often manifestly contain the true reading. But sometimes our translators followed the text and translated the marginal reading only in their margin. And, as the great majority of English bibles do not give the marginal readings, a large proportion of persons have no means of knowing the correction. In Is. ix. 3, an apparent contradiction results from this cause, making the passage unintelligible; "Thou hast multiplied the nation and NOT increased the joy; they joy before Thee ACCORDING TO THE JOY OF HARVEST" (that is—with a joy increased to the utmost). While the word translated "not" is in the Hebrew text, it is corrected in the margin by another (slightly different in form but having the same pronunciation) meaning *his* or *their;* and the translation should be—and increase THEIR joy. Thus the sentence becomes harmonious and clear. The Greek text of the new testament which the translators used had been printed from a small number of comparatively modern manuscripts imperfectly collated. Since then a much larger number have been discovered; some of which are of great antiquity and value. The collation of both Hebrew and Greek manuscripts, which has been prosecuted so assiduously since 1611, has produced many corrections, to the accuracy of which the best critics are agreed. They are indeed of various degrees of importance; none of them affect vitally the integrity of the Scriptures; many are very slight; yet not a few increase, decidedly, the clearness and force of the record; and on the whole they are considered to furnish a valid reason for a thorough revision.

9. Besides the erroneous or defective translations which have arisen from the sources already pointed out, others exist for which various causes might be assigned. The whole of Is. ix. 1, in connection with the preceding context needs revision, in order to dispel its darkness. We specify, now, only the latter part: "when at the first he lightly afflicted the land of Zebulon and the land of Naphtali and afterward did more grievously afflict her by the way of the sea, beyond Jordan, in Galilee of the nations:" this should be—as the former time degraded the land of Zebulon and the land of Naphtali, so the latter time shall glorify the way of the sea beyond Jordan, Galilee of the nations. "Woe to him who ladeth himself with thick clay," should be—who ladeth himself with goods taken in pledge. "To hunt souls to make them fly"—to hunt them as birds. "All that make sluices and ponds for fish"—all that work for wages are sorrowful in heart. The place in Jerusalem where Huldah dwelt was not "the college," but the second division of the city. "The land that thou abhorrest shall be forsaken of both her kings," should be—the land of whose two kings thou art afraid, shall be forsaken. It is not said in Job concerning the war-horse, "neither believeth he that it is the sound of the trumpet;" but—"he will not stand still when the sound of the trumpet is heard." The translation of Matthew's narrative concerning the receivers of what it calls "tribute money" who came to Peter, fails to show that it was not the political tribute to Rome which Jesus was asked to pay; thus the force of his claim to be rightfully exempt does not appear; also, "a piece of money," might be either too little or too much for Peter and himself. But in the Greek these points are definite and clear. The money demanded was the half shekel which the Mosaic law required every Jew to pay for the support of God's house; from this the Son of God, according to the analogies of earthly kings, was certainly free; and the specific coin which Peter was to find, was the exact amount for two. At the close of Heb. iii., there are three questions asked and answered, all closely related to one another and to the argument. But the first of them, the authorized revision changes to a positive, yet indefinite assertion, to the injury of the sense: "for some, when they had heard, did provoke; howbeit not all that came out of Egypt by Moses;" which should read interrogatively—for who were they who when they heard, provoked? Were not all of them those who came out of Egypt by Moses?

II. *The nature of the alterations proposed.* While the facts thus indicated may be accepted as supplying reasons for a thorough revision of the English Bible and as indicating the nature of the results expected, they also show that only a *revision* is required of the translation which, having been so long in use, is so diligently studied, ardently loved, and widely diffused. A new *translation* is not needed, is not desired, and, if made, could never take the place of the old. The revised Bible will read like the old; the hallowed associations which throng around it will not be dispelled; and when the

work is complete its greatest value will appear, not in the changes made, the obscurities removed, the errors corrected, and the improvements introduced; but in the confidence inspired by the fact that, thoroughly tested, line by line, and word by word during more than ten years by chosen companies of men most profound and exact in scholarship, the English Bible, needing no essential change, is confessed to be the most adequate and accurate translation that can now be made; and that the vast proportion of its renderings are without a flaw.

III. *Principles adopted for the work of revision.* 1. To make as few alterations as possible, consistently with faithfulness. 2. To limit, as far as possible, the expression of such alterations to the language of the authorized or earlier versions, preserving the former style. 3. Each company to go twice over the portion to be revised; once provisionally; the second time, finally. 4. To adopt the Hebrew or Greek text for which the evidence decidedly preponderates; and when this differs from that from which the authorized version was made, to indicate the difference in the margin. 5. On the first revision to decide by simple majorities; but on the final revision by each company to retain no change in the text not approved by two thirds of those present. 6. When a proposed alteration has given rise to discussion, to defer voting thereon till the next meeting whenever one third of those present so desire; such intended vote to be announced in the notice for the next meeting. 7. To revise the headings of chapters and pages, the paragraphs, italics, and punctuation. 8. That each company shall refer, when considered desirable, to divines, scholars, and literary men, whether at home or abroad, for their opinions.

IV. *The names and stations of the Committees of Revision.* This revision had its origin in the convocation of Canterbury, May 6, 1870, by the appointment of a committee of eminent biblical scholars and dignitaries of the church of England with power to revise, for public use, the English version of 1611; and to associate with them representative biblical scholars of other Christian denominations using that version. In accordance with the authority given them, that committee invited the appointment of a similar American committee, to be associated with them, virtually in one organization, with the same principles and objects and to be in constant correspondence with them, that both together may issue one and the same revision for all English-speaking people.

BRITISH REVISION COMMITTEE.

Old Testament Company.

Edward Harold Browne, D.D., bishop of Winchester (CHAIRMAN).
Arthur Charles Hervey, D.D., bishop of Bath and Wells.
Alfred Ollivant, D.D., bishop of Llandaff.
Robert Payne Smith, D.D., dean of Canterbury.
Benjamin Harrison, M.A., archdeacon of Maidstone, canon of Canterbury.
William Lindsay Alexander, D.D., professor of theology, Edinburgh.
Robert L. Bensly, fellow and Hebrew lecturer, Gonville and Caius college, Cambridge.
John Birrell, professor of oriental languages, St. Andrew's, Scotland.
Frank Chance, London.
Thomas Chenery, London.
T. K. Cheyne, fellow and Hebrew lecturer, Balliol college, Oxford.
A. B. Davidson, D.D., professor of Hebrew, Free Church college, Edinburgh.
George Douglas, D.D., professor of Hebrew and principal of Free Ch. col., Glasgow.
S. R. Driver, tutor of New college, Oxford.
C. J. Elliott, Windsor.
Frederick Field, D.D., Norwich.
John Dury Geden, professor of Hebrew, Wesleyan college, Manchester.
Christian D. Ginsburg, LL.D., Wokingham, Berks.
Frederick William Gotch, D.D., principal of the Baptist college, Bristol.
William Kay, D.D., Great Legh's rectory, Chelmsford.
Stanley Leathes, B.D., professor of Hebrew, King's college, London.
J. R. Lumby, D.D., fellow and professor St. Catharine's college, Cambridge.
John James Stewart Perowne, D.D., dean of Peterborough.
A. H. Sayce, fellow and tutor of Queen's college, Oxford.
William Robertson Smith, professor of Hebrew, Free Church college, Aberdeen.
William Wright, LL.D., professor of Arabic, Cambridge.
William Aldis Wright (Secretary), bursar of Trinity college, Cambridge.
Old testament company, 27.

New Testament Company.

Charles John Ellicott, D.D., bishop of Gloucester and Bristol (CHAIRMAN).
George Moberly, D.C.L., bishop of Salisbury.
Edward Henry Bickersteth, D.D., prolocutor, dean of Litchfield.
Arthur Penrhyn Stanley, D.D., dean of Westminster.
Robert Scott, D.D., dean of Rochester.
Joseph Williams Blakesley, B.D., dean of Lincoln.
Richard Chenevix Trench, D.D., archbishop of Dublin
Joseph Barber Lightfoot, D.D., LL.D., bishop of Durham.

Charles Wordsworth, D.C.L., bishop of St. Andrew's.
Joseph Angus, D.D., president of the Baptist college, London.
David Brown, D.D., principal of the Free Church college, Aberdeen.
Fenton John Anthony Hort, D.D., fellow of Emmanuel college, Cambridge.
William Gibson Humphry, vicar of St. Martin's-in-the-Fields, London.
Benjamin Hall Kennedy, D.D., canon of Ely, Regius professor of Greek, Cambridge.
William Lee, D.D., archdeacon of Dublin.
William Milligan, D.D., professor of divinity and biblical criticism, Aberdeen.
William F. Moulton, D.D., master of the Leys school, Cambridge.
Samuel Newth, D.D., principal of New college, London.
Edwin Palmer, D.D., archdeacon of Oxford.
Alexander Roberts, D.D., professor of humanity, St. Andrew's.
Frederick Henry Ambrose Scrivener, LL.D., prebendary, Hendon vicarage, London.
George Vance Smith, D.D., Carmarthen.
Charles John Vaughan, D.D., master of the temple, London.
Brooke Foss Westcott, D.D., canon of Peterborough, Regius professor of divinity, Trinity college, Cambridge.
J. Troutbeck (Secretary), Westminster.
New testament company, 25. *Active members in both companies*, 52.

AMERICAN REVISION COMMITTEE.

Old Testament Company.

Wm. Henry Green, D.D., LL.D. (CHAIRMAN), professor theological seminary, Princeton, N. J.
George E. Day, D.D. (Secretary), professor, divinity school of Yale college, New Haven, Conn.
Charles A. Aiken, D.D., professor, theological seminary, Princeton, N. J.
Talbot W. Chambers, D.D., Collegiate Reformed Dutch Church., New York.
Thomas J. Conant, D.D., Brooklyn, N. Y.
John De Witt, D.D., theological seminary, New Branswick, N. J.
George Emlen Hare, D.D., divinity school, Philadelphia.
Charles P. Krauth, D.D., LL.D., vice-provost, university of Penn., Philadelphia.
Charles M. Mead, D.D., theological seminary, Andover, Mass.
Howard Osgood, D.D., professor theological seminary, Rochester, N. Y.
Joseph Packard, D.D.; theological seminary, Alexandria, Va.
Calvin E. Stowe, D.D., Hartford, Conn.
James Strong, S.T.D., theological seminary, Madison, N. J.
C. V. A. Van Dyck, D.D., M.D., Beirût, Syria. (Advisory member on questions of Arabic).
Old testament company, 14.

New Testament Company.

Theodore D. Woolsey, D.D., LL.D., (CHAIRMAN), New Haven, Conn.
J. Henry Thayer, D.D. (Secretary), professor, theological seminary, Andover, Mass.
Ezra Abbot, D.D., LL.D., divinity school, Harvard university, Cambridge, Mass.
J. K. Burr, D.D., Trenton, N. J.
Thomas Chase, LL.D., president Haverford college, Pennsylvania.
Howard Crosby, D.D., LL.D., chancellor, university of the city of New York, N. Y.
Timothy Dwight, D.D., divinity school of Yale college, New Haven, Conn.
A. C. Kendrick, D.D., LL.D., university of Rochester, Rochester, N. Y.
Alfred Lee, D.D., bishop of the diocese of Delaware.
Matthew B. Riddle, D.D., professor theological seminary, Hartford, Conn.
Philip Schaff, D.D., LL.D., Union theological seminary, New York.
Charles Short, LL.D. (Secretary), New York.
E. A. Washburn, D.D., Calvary church, New York.
New testament company, 13. *In both companies*, 27. *Total, British and American*, 79.

BIBLE SOCIETY, an association having exclusively for its object the diffusion of the sacred Scriptures. Such associations must be regarded as a natural form of expression of Christian benevolence, acting according to the principles of Protestantism, and seeking to take advantage of the facilities afforded by the art of printing; but a long period elapsed after the reformation before a B. S. was formed; during which, however, an extensive diffusion of the Scriptures took place, and partly by the agency of associations which included it among other means for the advancement of Christianity. It necessarily became, along with the translation of the Scriptures, one of the objects to which missionary societies directed their energy. But perhaps the first association ever formed for the sole and specific purpose of providing copies of the Scriptures for those who were destitute of them, was that founded by baron Hildebrand von Canstein, an intimate friend of Spener, in conjunction with Francke at Halle, and which, down to 1834, when other Bible societies had begun to be established in Germany, had distributed 2,754,350 copies of the Bible, and about 2,000,000 copies of the New Testament.—The impulse, however, to the formation of the Bible societies now existing in all parts of Protestant Christendom proceeded from England, where, in 1780, an association was

formed for the distribution of Bibles among soldiers and sailors. It was at first simply called *The B. S.;* it exists to the present day, is now known as the *Naval and Military B. S.*, and confining itself to its original specific object, has accomplished much good. It is not an uninteresting circumstance, that the first ship in which Bibles were distributed by this society was the ill-fated *Royal George.*—In the beginning of 1792, a similar association was formed in London, under the name of the *French B. S.*, with a similar limited and specific object of distributing Bibles in the French tongue. It was probably the attitude assumed by infidelity in France which gave occasion to the formation of this society, but the greater part of its funds having been remitted to Paris for the printing of the Bible there, were lost, and everything belonging to the society destroyed in the tumult of the revolution.—It was not till 1802 that the first steps were taken towards the formation of the BRITISH AND FOREIGN B. S., the parent of a multitude of similar institutions, and the establishment of which must be regarded as the great epoch in the history of this branch of Christian beneficence; nor was the society fully organized and established till Mar. 7, 1804. Its formation took place in consequence of the deep impression made upon the mind of the Rev. Thomas Charles of Bala, in Wales, by the destitution of the sacred Scriptures which he found to exist in the sphere of his labors, and particularly by a circumstance strikingly illustrative of that destitution. Meeting a little girl in one of the streets of the town, he inquired if she could repeat the text from which he had preached on the preceding Sunday. Instead of giving a prompt reply, as she had been accustomed to do, she remained silent, and then weeping told him that the weather had been so bad she could not get to read the Bible. She had been accustomed to travel every week seven miles over the hills to a place where she could obtain access to a Welsh Bible. Mr. Charles, on his next visit to London, brought the subject of the want of Bibles in Wales under the notice of the committee of the *Religious Tract Society* (q.v.), when it was suggested by Mr. Hughes, a member of the committee, that a society might be formed for the purpose of supplying Bibles not only in Wales, but wherever destitution existed throughout the world. The society was constituted on the widest possible basis, churchmen and dissenters being alike included in it; and soon attained a greatness corresponding with that of the other two religious societies, the *London Missionary Society* (see MISSIONS), and the *Religious Tract Society* (q.v.), which had been formed on similar principles a few years before. It was indeed able to expend only about £619 in the first year of its existence. Its annual income gradually increased to an average of £70,000. But in 1875–76 it amounted to £116,802, derived from donations, legacies, collections, etc., and applicable to the general purposes of the society, besides £108 for a special object (the "Roxburgh fund"), and £105,410 derived from sales of Bibles and Testaments, abstracts, monthly reporters, etc.: showing the total net receipts for that year to be £222,320. Auxiliary and branch societies and dependent associations rapidly sprung up in all parts of Britain and in the colonies, the number of which at present amounts to between 5000 and 6000. Much more than one half of the expenditure of the British and foreign B. S. has been devoted to the diffusion of the authorized English version of the Bible, the only English version with which its fundamental rules permit it to have anything to do; it has also spent large sums in printing and circulating the Scriptures in the different Celtic languages spoken in Great Britain and Ireland, and a very important branch of its operations has been the printing of translations of the Bible prepared by missionaries. The number of translations of the Scripture—in many cases complete, in others extending only to the New Testament, in some only to particular books—which have been printed at the expense of the society, amounts to not less than 190, the greater part being translations never before printed, and many in languages possessing no previous literature.—The British and foreign B. S. now issues annually nearly three million copies of the Bible, the New Testament, or such portions of sacred Scripture as have been printed in languages not possessing complete translations. The whole number issued from the formation of the society to 31st Mar., 1876, was 76,432,723. This society also employs agents of high education and Christian character, to visit different countries for the promotion of its great object. The names of Dr. Henderson and Dr. Pinkerton, former agents, must be familiar to many readers, and perhaps no instance could be mentioned more happily illustrative of the character of this branch of the society's operations than the visit of Dr. Henderson to Iceland, an account of which is given in his well-known volume of travels in that country.—A controversy concerning the circulation of the books of the Apocrypha along with the canonical Scriptures by the British and foreign B. S. (see APOCRYPHA), led to a resolution in 1826, that its funds should be devoted, according to its original design, to the diffusion of the canonical books alone.—The EDINBURGH B. S. existed from that time forward as an entirely separate society, till 1861, when all the Scotch societies amalgamated to form the NATIONAL BIBLE SOCIETY OF SCOTLAND.

The AMERICAN B. S. is, in the magnitude and importance of its operations, next to the British and foreign Bible society. It was founded at New York in 1817, and still has its head-quarters in that city, in the *Bible House*, a very large and magnificent building, erected by special subscription. It reckons fully 2000 auxiliary societies, in all parts of the United States. Its income now amounts to about $700,000 (£140,000) a year, rather more than one-half being derived from sales of Bibles and Testaments, and the rest from donations, collections, etc. The American B. S. has for

some time issued annually more than 1,000,000 Bibles, New Testaments, and other portions of Scripture, and has in all distributed about 31,000,000 copies. The funds of the society have been chiefly expended in supplying the wants of the inhabitants of the United States, amongst whom the Indian tribes have not been neglected. "The Bible Association of Friends in America," founded at Philadelphia in 1829, has also distributed the Bible extensively.

Of the numerous Bible societies of Germany, the most important and extensively ramified is the Prussian central B. S. (*Hauptbibelgesellschaft*) in Berlin. It was founded in 1814, has branches in all parts of the Prussian dominions, and distributes annually about 35,000 Bibles and 14,000 New Testaments. There are besides numerous independent Bible societies in other parts of the German empire. A large number of Bibles are still, however, annually supplied to the people of Germany by the agents of the British and foreign B. S.—Bible societies were prohibited by the Austrian government in 1817, and some which had already been established in Hungary were dissolved.—The RUSSIAN B. S., founded at St. Petersburg in 1813, through the exertions of Dr. Paterson, and under the patronage of the emperor Alexander I., entered upon a career of great activity and usefulness, co-operating with the British and foreign B. S. for the printing of the Scriptures in the numerous languages spoken within the Russian dominions; but its operations were suspended in 1826 on the accession of the emperor Nicholas, its stock of Bibles, and the whole concern, being transferred to the *Holy Synod*, under the pretense that the sacred work of supplying the people with the holy Scriptures belonged to the church, and not to a secular society. The Bibles and Testaments in stock were indeed sold, and very large editions were thus disposed of, but the activity of a society which had no equal in continental Europe was at an end. A Protestant B. S. was then formed for the purpose of providing editions of the Scriptures, and circulating them among the Protestants of all parts of the empire, which now reckons about 300 auxiliary societies. But the action of this society "does not touch the members of the Greek church, or, if at all, only slightly and incidentally, and it makes no provision of the Scriptures in the language spoken by the great mass of the people. It is merely designed to meet the wants of colonists and others, who do not use the Russian language." Of the translations of the Scriptures published by the original Russian B. S., the greater number have never been reprinted since its suppression.

There can be no doubt that Bible societies have contributed very much to the progress of Christianity and civilization since the beginning of the 19th c., and their influence is continually increasing and extending.

BIBLE SOCIETY, AMERICAN. The first portion of Scripture printed in America was the New Testament, translated into the Indian language by John Eliot, and printed at Cambridge, Mass., in 1661; a translation of the whole Bible followed in 1663. A German Bible was printed at Germantown, Penn., in 1743. In 1777, the English New Testament, and in 1782 the entire Bible, was printed at Philadelphia. This was the first English Bible with an American imprint, and it was recommended by Congress, after an examination by the chaplains. The first Bible society in the United States was instituted at Philadelphia in 1808; the second, at Hartford; the third, at Boston; the fourth, at Princeton, N. J.; all in 1809. A few years later, about 60 local societies existed. Delegates from 35 of these met in New York, May, 1816, and organized the American Bible society, to which the local organizations became auxiliary. The number of auxiliaries increased rapidly, and at present amounts to 7000, including branches. In 1841, an act of incorporation for the American B. S. was obtained, with privileges which have since been enlarged. The first place of business was a room 7 ft. by 9; the next was 20 ft. sq.; the third was in a building erected in Nassau street, on a lot 50 ft. by 100; and afterwards enlarged. In 1852, the present Bible house was built, occupying the whole of the ground bounded by Third and Fourth avenues, Astor place and Ninth street, having a periphery of more than 700 ft., an open square in the center, and being 6 stories high. The structure is of brick with stone copings, and commands attention by its magnitude, admirable proportions, and appropriate finish. The working force consists of the executive and manufacturing departments; the former containing the corresponding secretaries, treasurer, and general agent; the latter includes printing, electrotyping, proof-reading, and other branches of the work. The number of persons employed is about 350. The printing is now executed on 23 large steam-power presses, and 3 of smaller size. In the bindery, also, the best modern improvements have been introduced. The society owns 120 sets of stereotype and electrotype plates, from which are printed 22 sizes of English Bibles, and 16 sizes of the New Testament; each size is bound in from 4 to 6 styles, as there is a demand for Bibles of all sizes in fine bindings; but by far the greater proportion of all issued are in plain styles, and are circulated among the poor. The whole Bible has been stereotyped, at great expense, in the Boston raised letter for the use of the blind. It is issued in 8 or in 16 volumes, any of which may be obtained separately. About 12,000 volumes have been circulated, in great part gratuitously.

The aim of the American B. S., and its auxiliaries, is to distribute Bibles as widely as possible among the destitute of all classes and religious denominations, either selling them at cost, or for a portion, of it, or giving them away to the very poor.

In 1829, an exploration of the states and territories was made, with a view to a general supply of the destitute. Every accessible family in the more settled portions of the country was visited. In 1856, a second general effort resulted in the supply of about 500,000 destitute families. In 1866, a third supply of the whole country was commenced, and has been vigorously carried forward.

The foreign work of the American Bible Society was done at first chiefly through missionary societies, by the contribution of funds to aid them in printing the Bible. In this way the countries are reached in which the American churches had established missions. The Scriptures are now published at the Bible house in French, Spanish, Portuguese, Welsh, German, Danish, Swedish, Arabic, Armenian, and Hawaiian. The New Testament, also, in Italian, Slavonic, Bulgarian, Syriac, Cherokee, Choctaw, Dakota, and Ojibwa. Smaller portions are printed in many additional languages. Editions have been prepared for the society at Paris, Bremen, Stockholm, St. Petersburg, Constantinople, Beirut, Lucknow, Lodiana, Bangkok, Foochow, Peking, Shanghai, Yokohama, and Honolulu.

RECEIPTS AND ISSUES OF THE AMERICAN BIBLE SOCIETY.

Decades.	Receipts.	Vols. Issued.
1816–26	$450,000	440,000
1826–36	955,000	1,550,000
1836–46	1,233,000	2,510,000
1846–56	3,042,000	6,772,000
1856–66	4,755,000	10,513,000
1866–76	6,794,000	11,340,000

BIBLE SOCIETY, AMERICAN AND FOREIGN, an organization formed by Baptists, who desired that translations of the Bible in foreign lands should conform as nearly as possible to the original Hebrew and Greek. In this they had mainly in view the rendering of *βαπτίζω* by *immerse* instead of *baptize*. In the circulation of the English Scriptures, they were willing that, for a time, the authorized version should be used. In 1850, a portion of the denomination, dissatisfied with this course, formed The American Bible Union, whose object, as set forth in its constitution, is "to procure and circulate the most faithful versions in all languages throughout the world." It has done much in foreign lands; and, with the assistance of scholars both in Europe and America, is engaged in revising the authorized version.

BIBLIA PAUPERUM, or Bible of the Poor, was a sort of picture-book of the middle ages, giving, on from forty to fifty leaves, the leading events of human salvation through Christ, each picture being accompanied by an illustrative text or sentence in Latin. A similar and contemporaneous work on a more extended scale, and with the legend or text in rhyme, was called *Speculum Humanæ Salvationis*, i.e., the "Mirror of Human Salvation." Before the reformation, these two books were the chief text-books used, especially by monks, in preaching, and took the place of the Bible with the laity, and even clergy; and as the lower orders of the regular clergy, such as the Franciscans, Carthusians, etc., took the title of "Pauperes Christi," Christ's Poor, hence the name. Many manuscripts of the *B. P.*, and of the *Mirror of Salvation*, several as old as the 13th c., are preserved in different languages. The pictures of this series were copied in sculptures, in wall and glass painting, altar-pieces, etc., and thus become of importance in the art of the middle ages. In the 15th c., the *B. P.* was perhaps the first book that was printed in the Netherlands and Germany, first with blocks, and then with types. The chief proof for the discovery of printing in Haarlem rests on the first impressions of the *Speculum Humanæ Salvationis*. See Coster.

BIBLICAL ANTIQUITIES, or Biblical Archæology, is a study which has for its objects the social and political constitution, the manners, customs, geography, etc., of the Jews and other peoples mentioned in the Scriptures. A knowledge of these is essential to a right understanding of many passages of Scripture. The antiquities of the ancient Jews themselves undoubtedly form the most important part of such a study; but an examination of the laws, customs, etc., of the neighboring Semitic nations is likewise indispensable. The principal sources of such knowledge are the Old and the New Testament; the books of Josephus on *Jewish Antiquities*, and the *Wars of the Jews;* the writings of Philo, the Talmud and Rabbinical works; and, lastly, Greek, Roman, and Arabian writers, with medals, monuments, and other works of art, the accounts of travelers, etc. The first work on Hebrew archæology was Thomas Goodwin's *Moses et Aaron, seu Civiles et Ecclesiastici Ritus Antiquorum Hebr.* (Oxford, 1616). Among later treatises we may especially notice Jahn's *Biblical Archæology* (5 vols., Vienna, 1796-1805); Bauer's *Manual of Hebrew Antiquities* (Leip. 1797); De Wette's *Manual of Hebrew-Jewish Archæology* (Leip., 1814); Rosenmüller's *Manual of Biblical Antiquities* (Leip., 1823); and Winer's *Biblical Dictionary* (3d. ed., Leip. 1847). A convenient work of reference on this subject is Dr. Kitto's *Cyclopædia of Biblical Literature*, which numbers among its contributors many of the ablest British and continental scholars; or *The Pictorial Bible*, edited by the same writer; also Smith's *Dictionary of the Bible*.

BIBLIOGRAPHY, a term applied to the description and proper cataloguing of books. It is derived from *bibliographia*, which was employed by the Greeks to signify the transcription of books, while *bibliographos* was merely a copyist. The introduction of the term in the meaning which we now attach to it may be dated from the appearance of the first volume of De Bure's *Bibliographie Instructive* in 1763.

The bare enumeration of the works that have been written on this branch of literature would more than fill an ordinary volume; we shall here confine ourselves to the more important of them.

A favorite dream of bibliographers has been the production of a general catalogue, embracing the whole range of printed literature; and one attempt at least has been made to realize it. In the year 1545, Conrad Gesner published at Zurich, in one folio volume, his *Bibliotheca Universalis*, in which are described, under the names of the authors, arranged alphabetically, all the books of the Hebrew, Greek, and Latin languages about which the compiler could obtain information. This restriction as to language, of course, does away to some extent with the idea of universality indicated by the title-page; still, as the three which are included were in Gesner's time almost the only ones employed by men of learning, his work may be regarded as a nearly complete account of the state of printed literature as it then existed. The only other effort in this direction which we have to record is the *Bibliotheca Britannica* of Dr. Robert Watt, 4 vols. 4to (Edinburgh, 1824). Its object will be best described by the following extract from the preface to it: "The account given of British writers and their works is universal, embracing every description of authors, and every branch of knowledge and literature. What has been admitted of foreign publications, though selective, forms a very considerable and valuable portion of the work, and as none of note have been purposely omitted, the *Bibliotheca Britannica* may be considered as a universal catalogue of all the authors with which this country is acquainted, whether of its own or of the continent." This great work was compiled under very adverse circumstances, and its author did not live to see it through the press. It thus labors under all the disadvantages of a posthumous publication; but with all its faults both of omission and commission, which are neither few nor small, it deservedly maintains a high character as a work of reference, and is indispensable to the library of every bibliographer.

The other laborers in this field of literature, whose works we are about to notice, have confined themselves within narrower limits. Some, proceeding upon a principle of selection, endeavor to furnish the inquirer with the information he seeks in regard to books which are rare, curious, or valuable; others, again, aiming at greater completeness within certain bounds, restrict themselves to the description of a special class of works—the literature, for example, of a particular country or language; the productions of a celebrated press; the books published within a given period; those of which the authors have withheld their names, or have veiled them under a pseudonym; the treatises that have been written on a specific subject; and so on, together with a few which hardly admit of classification, but of which some examples will be given.

Bibliographical works on the selective principle form a numerous class; the following are amongst the more important: Vogt, *Catalogus Historico-criticus Librorum Rariorum*, 8vo (Francofurti, 1793). This is the fifth edition; the four preceding appeared successively at Hamburg in 1732, 1738, 1747, and 1753. David Clement, *Bibliothèque Curieuse, ou Catalogue raisonné de Livres difficiles à trouver*, 9 vols. 4to (Göttingen, 1750–60). The expression *catalogue raisonné* is usually, but erroneously, applied in this country to classified catalogues; yet the work of Clement, who was the son of a Frenchman, and certainly understood the language in which he wrote, is arranged alphabetically. It is simply what it professes to be, a descriptive and methodized account of the books which it includes; but unfortunately it was never completed. It terminates with the article *Hesiodus*, and the seven or eight volumes required to finish it have not been published. The *Bibliographie Instructive* of De Bure has already been mentioned; it extends to seven volumes 8vo, the last of which appeared in 1768. To these, however, should be added the *Catalogue des Livres de Gaignat*, 2 vols. 8vo (Paris, 1769), and the *Table destinée à faciliter la Recherche des Livres Anonymes*, 8vo (Paris, 1782). Ebert's *Bibliographisches Lexicon*, 2 bde. 4to (Leip., 1821–30), is an accurate and useful work. It has been translated into English, 4 vols. 8vo (Oxford, 1837). Lowndes's *Bibliographer's Manual* contains an account of rare, curious, and useful books, published in or relating to Great Britain, from the invention of printing, and may always be consulted with advantage. It appeared originally in 4 vols. 8vo (Lond., 1834); but a new edition, with many improvements, has since been published (1857–64) in 11 parts or 6 vols., under the editorship of Mr. H. G. Bohn. One of the most interesting and important works in this department of B. is the *Manuel du Libraire et de l'Amateur des Livres* of J. C. Brunet, of which it is hardly possible to speak in terms of too high commendation. It was first published in 1810, in 3 vols. 8vo; and the fifth edition, in 6 vols. 8vo (Paris, 1860–65), is now out of print. The sixth vol. contains a valuable classed catalogue, the only modern effort of this kind. Another work of a similar, but somewhat more extensive character, entitled *Trésor des Livres Rares et Précieux*, by J. G. T. Graesse, was published at Dresden, in 7 vols. 4to (1859–69). In it more attention has been paid to the northern literatures than in Brunet. To these may be added the amusing and instructive bibliographical works of the Rev. Dr. Dibdin.

Turning to special B., and taking the subjects of which it treats in the order given above, we have to notice first the works which confine themselves to the literature of a particular country or language. As regards Great Britain, we have besides Watt and Lowndes, already mentioned, the *Typographical Antiquities* of Ames and Herbert, 3 vols. 4to (Lond., 1785–90). A new and improved edition was projected by Dibdin, but was not completed. Volumes 1 to 4 only have appeared, 4to (Lond., 1810–19). A recent contribution to British B. is the *Critical Dictionary of English Literature and British and American Authors*, by S. A. Allibone, 3 vols. 8vo (Philadelphia, 1859–71). Of this work we regret that we cannot speak favorably. It faithfully reproduces most of the errors of Watt, with the addition of not a few for which the compiler is himself responsible. Our French neighbors possess a treasure in *La France Littéraire* of J. M. Querard, but it embraces only the 18th and 19th centuries. The continuation, begun by Querard, and afterwards carried on by Louandre and Bourquelot, forms 6 vols. 8vo (Paris, 1846–57). A further continuation by Lorenz (*Cat. Général de la Librairie Française pendant 25 ans* (1860–65, 4 vols. 8vo, Paris, 1867–71) brings the work down to a recent date. For the literature of Italy, we can only notice Gamba's *Serie de' Testi*, 4th ed. (Venice, 1839); and for that of Spain, the *Bibliotheca Hispana Vetus*, and the *Bibliotheca Hispana Nova*, of Antonio, the latest and best editions of which appeared at Madrid (1683–88) in folio. The authors of the Low Countries are enumerated in the *Bibliotheca Belgica* of Foppens, 2 vols. 4to (Brussels, 1739); and those of Scandinavia in the *Almindeligt Litteraturlexicon for Danmark, Norge, og Island*, of Nyerup and Kraft, 4to (Copenhagen, 1820). For Germany, we have Heinsius, *Allgemeines Bücherlexicon*, with supplements (10 vols. 4to, 1812–49), and Ebert's *Handbuch der Deutschen Litteratur*, 4 vols. 8vo (Leip., 1822–40). To this class also belong the *Bibliotheca Græca*, *Bibliotheca Latina*, and *Bibliotheca Latina Mediæ et Infimæ Ætatis* of Fabricius; Harwood's *View of the various Editions of the Greek and Roman Classics;* and Moss's *Manual of Classical Bibliography*. The oriental student will find much to interest him in the *Lexicon Bibliographicum* of Haji Khalfa, edited in the original Arabic, with a Latin translation by Fluegel, 7 vols. 4to, 1835–58.

Of works descriptive of the productions of particular presses, we can only notice Renouard's *Annales de l'Imprimerie des Alde* (3d ed. 8vo, 1834); the *Annales de l'Imprimerie des Estiennes*, by the same author, 8vo (Paris, 1837–38); and Bandini, *Juntarum Typographiæ Annales*, 2 vols. 8vo (Luccæ, 1791). The student may also consult with advantage the *Notice de la Collection des Auteurs Latins, Français, et Italiens Imprimés en petits Formats par les Elzeviers*, at the end of the 5th volume of Brunet's *Manuel*.

The bibliographers who have confined themselves to books printed within a given period are chiefly Panzer, *Annales Typographici ab Artis Inventæ Origine ad Annum M.D.* (continued, however, to 1536), 11 vols. 4to (Norimbergæ, 1793 to 1803); and Hain, *Repertorium Bibliographicum*, 4 vols. 8vo, 1826–38. The death of the author before the completion of this work, was the cause of the comparative inaccuracy observable in the 3d and 4th volumes. The article "Virgil," for example, is omitted altogether.

One of the earliest attempts to reveal the authorship of anonymous works was the *Theatrum Anonymorum et Pseudonymorum* of Vincent Placcius, folio (Hamburg, 1708); to which Mylius added a supplement in 1740. So far as France is concerned, these have both been superseded by the admirable and well-known *Dictionnaire des Ouvrages Anonymes et Pseudonymes* of Barbier, 2d ed., 4 tom. 8vo (Paris, 1822–27). Italy, too, has the *Dizionario di Opere Anonime e Pseudonime di Scrittori Italiani* of Melzi, 3 vols. 8vo (Milano, 1848–59). Mr. Ralph Thomas's (Olphar Hamst) *Handbook of Fictitious Names* (London, 1868, 8vo), a slight and tentative, though useful production, is the only work yet published on the anonymous and pseudonymous literature of Britain; but Mr. Halkett, formerly keeper of the Advocates' Library, Edinburgh, has left extensive collections on this subject, which are being arranged and supplemented by the rev. John Laing, of the New College Library, Edinburgh. Recent additions to this branch of B. are Weller's *Maskirte Literatur der älteren und neueren Sprachen*, 1ter Theil; *Index Pseudonymorum* (1856), 2ter Theil; *Die falschen und fingirten Druckorte* (1858).

Bibliographies which describe treatises on special subjects are very numerous; we have only space to notice the following: Lipenius, *Bibliotheca Realis Theologica*, 2 vols. folio (Francofurti, 1685); *Bibliotheca Philosophica*, 1682; *Bibliotheca Medica*, 1679; *Bibliotheca Juridica*, 1672—a new edition of the last of these was published at Leipsic in 1757, and supplements have been successively added by Scott, Senkenberg, and Madihn—Marvin's *Legal Bibliography*, 8vo (Phila. 1847); Orme's *Bibliotheca Biblica*, 8vo (Edin. 1824); Fürst's *Bibliotheca Judaica*, 8vo (Leip. 1849–51); Vater, *Litteratur der Grammatiken, Lexica und Wörtersammlungen aller Sprachen der Erde*, 2te Ausg. von B. Jülg, 8vo (Berlin, 1847); Upcott's *Bibliographical Account of the Principal Works relating to English Topography*, 3 vols. 8vo (Lond. 1818); Oettinger's *Bibliographie Biographique Universelle*, 8vo (Bruxelles, 1854); *The Literature of Political Economy*, by J. R. M'Culloch, 8vo (Lond. 1845); *Arithmetical Books from the Invention of Printing to the Present Time*, by Augustus de Morgan, 12mo (Lond. 1847); the *Biographia Dramatica*, by Baker, Reed, and Jones, 3 vols. 8vo (Lond. 1812); and the *Bibliotheca Anglo-poetica*, 8vo (Lond. 1815).

As examples of other works not included in the above classification, we have only space to mention Van Praet's *Catalogue des Livres Imprimés sur Vélin*, 9 vols. 8vo (Paris, 1822–28); Peignot's *Dictionnaire des Livres condamnés au Feu*, 2 vols. Paris, 1806;

and Martin's *Bibliographical Catalogue of privately printed Books*, 2d ed., 8vo (Lond. 1824.)

Further information will be obtained from an excellent bibliography of bibliographies, Petzholdt's *Bibliotheca Bibliographica* (Leipzig, 1864, 8vo).

BIBLIOMANCY (Gr. *ta biblia*, the Bible, and *manteia*, divination), a mode of divination much practiced during many ages, by opening the Bible, and observing the first passage which occurred, or by entering a place of worship and taking notice of the first words of the Bible heard after entering it. The application was often very fanciful, and depended rather upon the mere sound of the words than upon their proper signification, or the scope of the passage. Prayer and fasting were sometimes used as a preparation for a mode of consulting the divine oracles, than which nothing could be more contrary to their purpose and spirit, and which was in harmony only with the notions and practices of heathenism. B. was prohibited, under pain of excommunication, by the council of Vannes, 465 A.D., and by the councils of Agde and Orleans in the next century. It continued, however, to prevail for many centuries thereafter, and is said to have been introduced into England at the Norman conquest. It was essentially the same as the *Sortes Virgilianæ*, the only difference being in the book employed.

BIBLIOMANIA, or book-madness, is a word recently formed from the Greek to express the passion for rare and curious books, which has manifested itself to such an extent during the last century. While the ordinary collector is satisfied with the possession of works which are valuable either on account of their established reputation, or as assisting him in his literary or professional pursuits, the bibliomaniac is actuated by other motives. With him utility is of secondary importance, rarity being the first and great requisite. Thus even a common book becomes valuable in his eyes, if it be one of a few copies thrown off on vellum or on large paper, or if it has been bound by Derome, Bozerian, Lewis, or Payne; and for the same reason, he sometimes prefers an inferior to a better article. The fac-simile reprint of the Giunta edition of Boccaccio's *Decameron* (Florence, 1527) fetches hardly as many shillings as the original does pounds, yet the great distinguishing difference between them is, that the former is the handsomer and more correct of the two.

The formation of complete sets of such books as the *Elzevir Republics* (see ELZEVIR), or of the works of a single author, provided they be scarce, is a favorite pursuit with many. The editions of the classics most prized by collectors are those of the Elzevirs and of the Foulises (q.v.). The original editions of Defoe's numerous productions are eagerly sought for at present.

B. seems to have reached its climax at the sale of the library of the duke of Roxburghe in 1812. Amongst the treasures which that library contained, was the only perfect copy, known to exist, of the first, or at least the first dated edition of Boccaccio's *Decameron* (Venice, Christ. Valdarfer, 1471). After a spirited competition with lord Spencer, this volume was purchased by the marquis of Blandford for the sum of £2260, the highest price perhaps ever paid for a single book. When the collection of the marquis came under the hammer in 1819, lord Spencer secured this precious tome at the large yet more moderate cost of £918 15s. It is now, we believe, in his lordship's library at Althorp.

One of the results of the Roxburghe sale was the establishment of the Roxburghe club, the object of which was to reprint, for the use of the members only, works hitherto unedited, or of extreme rarity. The example thus set was speedily followed by the Bannatyne and Maitland clubs in Scotland, and by many more in other parts of the kingdom. Some of these are defunct, and others are in a moribund state. It remains to be seen in what new form the B. of the present day will develop itself.

BICANE'RE, capital of the protected state of the same name (see BIKANIR) in Rajpootana, India, lies in a desolate tract, 1175 m. to the n.w. of Calcutta, in lat. 28° n., and long. 73° 22′ east. Pop. about 60,000. It is surrounded by a battlemented wall of 3½ m. in circuit; and from a distance presents a magnificent appearance, but inside, the people are found to be extremely filthy. Immediately to the n.e. is a detached citadel, of which the rajah's residence occupies the greater part.—The state of which B. is the capital, lies in lat. 27° 30′ to 29° 55′ n., and long. 72° 30′ to 75° 40′ e., thus measuring, in its extremes, 160 m. by 200. It contains 17,676 sq.m., with an estimated population of 540,000. The Rajpoots are the predominant race; but the Jauts form the great body of the inhabitants. Though the people find their principal resource in pasturage, yet water appears to be remarkably scarce. In the whole territory, there is not one perennial stream; while wells, as precarious and scanty as they are brackish and unwholesome, average perhaps 250 ft. in depth; even the lakes or *sirris*, which the periodical rains leave behind them, are generally saline, yielding, in fact, at the close of the dry season, a thick crust of salt. In 1868–69, nearly the half of the population was destroyed by drought. The temperature varies greatly: in the beginning of Feb., ice is formed on the ponds; and in the beginning of May, the thermometer stands at 123° F. in the shade. Again, in the beginning of Nov., according to Elphinstone's experience, each period of 24 hours, according as the sun was above or below the horizon, presented such extremes of heat and cold as often to be fatal to life.

BICE (Ger. *beis*, Ital. *biadetto*), the name of two pigments of a blue and green color respectively, known to artists from the earliest times—blue B. as *mountain blue, ongaro, azzuro di terra*, etc.; and green B. as *chrysocolla, Hungarian green, verde de Miniera, verde de Spagna, verdetto*, etc. Green B. is now usually called *malachite green* and *mountain green*. Both are native carbonates of copper, but are also prepared artificially. In its native state, however, B. is more durable, and in the case of mountain green especially, much more brilliant. Artificial blue B. is known as Hambro' blue, mineral blue, etc.; artificial green B., as mountain green, Paul Veronese green, and emerald green.

BICEPS (double-headed) is the muscle which gives a full appearance to the front of the arm. Above, it consists of two portions or heads—whence its name—one being attached to the coracoid process of the scapula, the other to the margin of the depression on that bone which lodges the head of the humerus. The former is the short, the latter the long head of the biceps. They unite to form a fleshy belly, which terminates in a rounded tendon.

The B. tendon is inserted into the tubercle of the radius (see ARM). Before passing to this insertion, it gives off an expansion, which separates the median basilic vein from the brachial artery in the situation generally selected for venesection. The action of the B. is rapidly to bend the fore-arm, and also to supinate the hand.

BICÊTRE, originally the name of a very old castle, situated on a little eminence in the neighborhood of Paris, and commanding one of the finest views of the city, the Seine, and the environs. In 1632, it was destroyed, because it had become a hiding-place of thieves. Afterwards, it was rebuilt by Louis XIII., and made a hospital for old soldiers. When Louis XIV. had built the *Hôtel Royal des Invalides*, the B. was made a civil hospital for septuagenarians. It was for a long time used also as a prison for criminals, mostly those condemned to the galleys, but is now entirely occupied as a hospital for indigent old people and for incurable lunatics. There is a well sunk in the rock to the depth of 183 feet.

BICHAT, MARIE FRANÇ. XAVIER, one of the most famous anatomists and physiologists, whose discoveries make an epoch in biology, was b. at Thoirette, in the department of Ain, France, Nov. 11, 1771. He studied chiefly in Paris under Desault, who adopted him as his son, and whose surgical works he edited. In 1797, he began giving lectures on anatomy, along with experimental physiology and surgery, and in 1800 was appointed physician in the Hôtel-dieu. Two years after, July 22, 1802, he fell a victim to intense and unremitting labor, before he had completed his 31st year. He was the first to simplify anatomy and physiology by reducing the complex structures of the organs to the simple or elementary tissues (q.v.) that enter into them in common. This he has done in his *Anatomie Générale* (2 vols., Par. 1801, often reprinted). In his *Recherches Physiologiques sur la Vie et la Mort* (Par. 1800), he develops another luminous idea—the distinction between the organic and the animal life.

BICKERSTAFF, ISAAC, author of numerous comedies and light musical pieces produced under Garrick's management, which had at one time a great popularity, was b. in Ireland about the year 1735, and became page to lord Chesterfield, who was made lord lieutenant of Ireland in 1746. B. afterwards became an officer of marines, but was dismissed the service for some discreditable offense. Nothing is certainly known regarding his after-life, nor the time of his death, which would seem to have taken place on the continent. His best known pieces are *The Maid of the Mill; The Padlock; He would if he could; Love in a Village; The Hypocrite;* and *The Captive.*

BICKERSTETH, Rev. EDWARD, an influential clergyman of the church of England, was b. at Kirkby Lonsdale, in Westmoreland, Mar. 19, 1786. He commenced life as a post-office clerk; and afterwards, having served an apprenticeship to a London attorney, established a lucrative solicitor's business in Norwich. Here, he took great interest in all meetings of a religious nature, and soon became so deeply impressed with the importance of religious truth, that he resolved to devote himself to the ministry. Being admitted to orders, he was sent by the church missionary society to reorganize their mission stations in Africa. Having most satisfactorily accomplished his mission, B. was, on his return, appointed secretary to the church missionary society, and continued to discharge the duties of the office with unwearied energy and devotion that won for himself a high reputation and extensive influence, as well as great prosperity for the institution he represented, until 1830, when he resigned on acceptance of the rectory of Watton, in Hertfordshire. Here, until his death, which took place Feb. 24, 1850, he took an active part in promoting, both by tongue and pen, almost every work having for its object the spread of religious truth whether at home or abroad. B. belonged to what is known as the evangelical section of the church of England, and took a decided part against the endowment of Maynooth, and in opposition to the spread of tractarianism in his own church. He was also one of the founders of the evangelical alliance. Of his religious writings—which have been collected in 16 vols. (Lond., 1853)—the most popular are, *A Help to the Study of the Scriptures* (written before he was ordained), *The Christian Student*, and *A Treatise on the Lord's Supper*. B. also edited *The Christian Family Library*, a work consisting of 40 vols.

BICKERSTETH, EDWARD HENRY, b. England, 1825; son of Edward; educated at Cambridge; curate in 1848 in Birmingham, and since then in several places; rector, and latterly private chaplain to the bishop of Ripon. Among his works are *The Rock of Ages, or Scripture Testimony to the One Eternal Godhead of the Father, of the Son, and of the Holy Spirit, The Blessed Dead, The Risen Saints, Hades and Heaven, The Spirit Life, The Shadowed Home and the Light Beyond*, and several long and short poems. He is best known in this country by his long poem *Yesterday, To-day, and Forever*, which has won great admiration, with some adverse criticisms.

BICYCLE, a form of velocipede or lightly-built wheeled vehicle propelled by the person who occupies it. The bicycle, as its name (from Gr. *bis*, twice, and *kyklos*, wheel) imports, has but two wheels; and as these are placed in line one behind the other, the machine acquires and retains its stability in the erect position only in motion. The front wheel of the bicycle is generally about twice as high as that behind, and may be as much as 60 in. in diameter. The two wheels are connected by a "backbone" which rests in front on a forked bar rising perpendicularly from the axle of the front wheel. The rider, sitting on a saddle fixed to the backbone, moves the bicycle with his feet by means of cranks attached to the axle of the front or driving wheel, and steers by help of a cross-handle affixed to the erect bar. The bicyclist may without undue exertion attain a pace of 9, 10, or more m. an hour, and can sustain this pace for many hours. As much as 106 m. have been accomplished in less than eight hours. The whole machine, though now made almost wholly of steel and iron, need not weigh more than 50 pounds. The earliest form of bicycle introduced from France about 1820, had two heavy wooden wheels of the same size, and was driven by the rider striking his feet on the ground.

BICYCLE (*ante*), a machine for human locomotion, consisting of two wheels connected by a single bar; the forward wheel having a diameter of 30 to 60 in., the rear wheel, directly behind the other, being about one third as high. At first these machines were made with wheels of the same size, or nearly so; but no satisfactory speed was obtained until Parisian builders hit upon the device of a small hind wheel. That which was little better than a child's velocipede was by this improvement raised to the respectability of an important means of locomotion, and the speed already attained is wonderful. On fairly level roads that are in good repair, an expert rider can outdo a fast horse within an hour or so. In England some remarkable performances are recorded. A hundred miles a day for several successive days have been traversed; the space between Tunbridge and Liverpool, 234 m., in 18 h. 35 min.; the journey from London to John o' Groat's, more than 800 m., over hilly and often bad roads, in 14 days. The bicycle for fast travel has a large forward or driving wheel, which the rider can fit his legs to. The larger the wheel, the greater the speed to be obtained. The rider's feet, that give the motive power, rest on stout cranks placed at right angles, so that in working the machine his legs nearly imitate the act of rapid walking or running. He is seated on a little saddle just behind the large wheel, and guides his course by a bar with double handles. By this crank he swerves the forward wheel at will, and the expert can make sharp curves, and perform many surprising feats of gyration. The first thing to be learned is balancing, and that is best achieved by trying short trips down a slight incline. When balancing is accomplished and steering mastered, practice will soon make a rapid rider. In the bicycle for service there is or should be a rest for the feet, since in going down hill there is little work for the cranks or treadles. The B. is not only a pleasant and cheap means of travel, but it adds the zest of good exercise, and is therefore growing in favor in this country. A good bicycle ought to have india rubber tires, to prevent jolting, to be made of the strongest material, and to weigh only about 50 lbs. For speed, the forward wheel, made as large as the rider can manage, is usually from 48 to 60 in. in height. Of this machine there are two general styles: the "racer," built very light for speed, and the "roadster," heavier for steady service.

BIDA, a large inland t. in Africa, 9° 5′ n., 6° 5′ e., 16 m. n. of the Niger; the capital of the kingdom of Nufe.

BIDASSO'A, a river which, rising in Spain, forms the boundary between that country and France, and falls into the bay of Biscay at Fuenterabia. The treaty of the Pyrénées was concluded on an island in its mouth in 1659. The B. was the scene of several conflicts during the Spanish campaign. In April, May, and June, 1793, the Spanish crossed the river, and defeated the French, who occupied a line extending from St. Jean Pied-de-Port to the mouth of the B., in three successive encounters, capturing a considerable quantity of ammunition and several pieces of cannon. In July of the following year, however, the French captured the intrenched camp and all the fortified posts of the Spaniards—defended by 200 pieces of cannon—on the river. Napoleon, in June, 1811, had a *tête-du-pont* constructed on the B. at Irun. In Aug., 1813, the French under Soult were defeated at San Marcial on the B. by the allies; and in the Oct. of the same year, Wellington surprised and drove the French from their strongly fortified positions on its northern side.

BID'DEFORD, a city in Maine on the Saco, 9 m. from its mouth, and 15 m. s.w. of Portland, on the Boston and Maine, and the Portsmouth, Saco, and Maine railroads;

pop. '70, 10,282. B. was settled in 1616–17, by Richard Vines, when York county comprised the whole province of Maine. The main business is manufacturing, and the exportation of a superior quality of granite.

BIDDING PRAYER is a form of exhortation, always concluding with the Lord's prayer, enjoined by the 55th canon of the Anglican church, in 1603, to be used before all sermons and homilies. Except in cathedrals and the university churches, it is now but seldom used. The term "B." is from the Saxon "Bede," signifying a prayer. The form is of extreme antiquity, and we have a similar one in the apostolical constitutions (q.v.), the original of which was probably that used in the church of Antioch. It was anciently used for the communicants or believers after the dismissal of the catechumens, and was pronounced by the deacon, each petition beginning with the words, "Let us pray for ——," and the people responding at the end of each with "Kyrie Eleeison," or some such words.

There is another very ancient example in the Ambrosian liturgy; and St. Chrysostom alludes to such a form in one of his sermons. It must have been, and even now in its abridged shape still is, very impressive, allowing each individual to supply from his own thoughts special cases of necessity under the different heads. There is some resemblance between these B. prayers and the Litany, and prayer for the church militant, now used in the Anglican church.

BIDDLE, CLEMENT, 1740–1814; b. Philadelphia; a Quaker, but a soldier, who raised a corps for the protection of friendly Indians against the outlaws known as "Paxter boys." In the beginning of the revolution he was an officer in the Quaker volunteers, and was made deputy quartermaster-general. He took part in the fight at Trenton, where he secured the resigned swords of the Hessian officers. He was also at Princeton, Brandywine, and Germantown, and rendered valuable service in the terrible winter of 1777–78 at Valley Forge. In 1794, he went against the whisky insurrection. Washington thought highly of B., and made him U. S. marshal for Pennsylvania.

BIDDLE, CLEMENT CORNELL, son of Clement, 1784–1855. He was in the navy when young, but left it for the law. In the second war with England he was capt. of dragoons and col. of volunteers. He is best known by his notes and additions to the translations of Say's *Treatise on Political Economy*. He was prominent in the national free-trade convention of 1831.

BIDDLE, JAMES, b. Philadelphia, 1783–1848; an American naval capt.; served as midshipman in the war with Tripoli, where he was made prisoner and kept until the peace. He was lieut. on the *Wasp*, which captured the British *Frolic* early in the war of 1812, and was put in command of the prize, but both were captured by the *Poictiers* and taken to Bermuda. Exchanged in 1813, he served on the *Hornet*, in command of which he sailed for the East Indies, captured the *Penguin*, and was wounded in action. Congress gave him a gold medal and the rank of captain. In later years he was a commissioner to make a treaty with Turkey.

BIDDLE, JOHN, the founder of English Unitarianism, was b. in 1615, at Wotton-under-Edge, in Gloucestershire, and in 1632 entered Magdalen college, Oxford, where he took his degree of M.A. In 1641, he was elected master of the free school in the town of Gloucester, the duties of which function he discharged with such zeal, that the character of the institution was greatly improved; but having embraced certain opinions—which he printed for private circulation—in regard to the personality of the Holy Spirit, at variance with those held by the majority of Christians, he was thrown into jail, Dec., 1645. Being at length summoned before the parliament at Westminster, on account of his heresy, he was formally tried, and condemned to imprisonment for 5 years. The famous Westminster assembly of divines undertook to "settle" B.'s case, but unfortunately their arguments—as is usual in disputation—had only the effect of strengthening his previous convictions. In 1648, while still in prison, he published a *Confession of Faith concerning the Holy Trinity*, etc., which was followed by another tract containing the opinions of the church fathers on the same question. In consequence of this attempt to combat the orthodox doctrine, the Westminster divines called upon the parliament to pass an act declaring the denial of the Trinity a crime punishable by death. The *army*, however, strange to say, proved on this occasion less cruel than the *church*, for it manifested such strong opposition that the act remained a dead-letter. Under the liberal rule of Cromwell, B. was released. He now commenced to gather a congregation of those whom he had converted to his opinions—namely, that there was but one person, as there was but one nature, in the Godhead. The members were first called Bidellians, then Socinians, and finally assumed for themselves the name of Unitarians. Twice, however, after this, during the commonwealth, B. suffered severely for his creed, and even the iron-willed protector himself, in order to save his life, was compelled to banish him to one of the Scilly isles. Three years of imprisonment having elapsed, he was permitted to return, and continued to preach in London till the death of Cromwell, and also after the restoration, until June, 1662, when he was again apprehended and fined in £100, and being unable to pay, was committed to jail, where he died in Sept. of the same year. His personal character was highly esteemed by those who knew him.

BIDDLE, NICHOLAS, b. Philadelphia, 1750; killed by an explosion at sea, 1778. When but 15 years of age he was left on an uninhabited island of the West Indies, where he remained two months. In 1770, he entered the English navy, and served as a seaman on Nelson's vessel in capt. Phipps's exploring expedition. In the revolution he joined the Americans and commanded a small brig in the attack on New Providence; in 1776, captured two British transports with valuable cargoes and a battalion of Highlanders; as commander of the *Randolph* he took four prizes, and received command of a fleet to cruise in the West Indies, where he was wounded in an engagement with the *Yarmouth*. While he was in the hands of the surgeon the magazine blew up, and of 315 men all but four were killed.

BIDDLE, NICHOLAS, an American financier, b. at Philadelphia in 1786, graduated at Princeton college, and became an energetic member of the legislature of Pennsylvania. In 1823, he was appointed president of the U. S. bank, and held that post till 1839. He conducted its affairs at first with great skill, integrity, and prudence; but in 1838, the bank became insolvent, and in Oct. of that year suspended cash payments. The commercial panic and distress which at that time prevailed in the United States, spread dismay far and wide, and involved multitudes in ruin. In Dec., 1841, the grand jury for the county of Philadelphia made a presentment against B. and some others for entering into a conspiracy to defraud the stockholders of the bank of $400,000 in 1836, and endeavoring to conceal the same by a fraudulent and illegal entry in 1841; the presentment, however, was never followed up. B. had considerable literary taste, and for some time edited the *Philadelphia Portfolio*, contributing many articles to its pages. By request of the president of the United States, he compiled from the original papers a *History of Lewis and Clarke's Expedition to the Pacific Ocean;* also *The Commercial Digest*, a volume put forth by congress. A number of his essays, speeches, etc., were published. He died in Jan., 1844.

BIDDLE, RICHARD, 1796–1847; brother of the president of the U. S. bank, a lawyer and leader of the Pittsburgh bar. He published a *Review of Capt. Basil Hall's Travels in North America*, and a *Memoir of Sebastian Cabot, with a Review of the History of Maritime Discovery*. In 1837-40, he was a member of congress.

BIDEFORD, a seaport t. of Devonshire, on both sides of the Torridge, near its confluence with the estuary of the Taw, 30 m. n.w. of Exeter. A bridge of 24 arches, and 677 ft. long, unites the two divisions of B., which has manufactures of ropes, sails, earthenware, and leather. These it exports, together with oak-bar, corn, flour, linens, woolens, iron, and naval stores. Pop. '71, 6969. In 1875, 103 vessels, of 6776 tons, belonged to the port; and 813 vessels, of 37,620 tons, entered, and 215 vessels, of 10,848 tons, cleared it. Vessels of 500 tons can get up to the quay in the center of the town. Sir R. Granville, the discoverer of Virginia, was born in Bideford.

BIDPAI, or PILPAI, is the reputed author of a collection of fables and stories which have been widely current both in Asia and Europe for nearly 2000 years, passing as a compendium of practical wisdom. Scarcely any book except the Bible has been translated into so many languages; and its history deserves attention as part of the history of human development. The researches of Colebrooke, Wilson, Sylvestre de Sacy, and Loiseleur des Longchamps (*Essai sur les Fables Indiennes*, 1838) have successfully traced the origin of the collection, its spread, and the alterations it has undergone among different nations. The ultimate source is the old Indian collection in Sanscrit, with the title *Panchatantra* (q.v.), i.e., "Five Sections" (edited by Kosegarten, Bonn, 1848). An analytical account of the Sanscrit *Panchatantra*, by H. H. Wilson—who determines the date of its production to be subsequent to the 5th c. A.D.—is printed in the *Transactions* of the royal Asiatic society, vol. i.; but an abridgment of it, called the *Hitopadesa* (q.v.), is better known than the original. A critical edition of the *Hitopadesa* has been published by A.W. von Schlegel and Lassen (Bonn, 1829), and translations have been made into English by Wilkins and Jones, and into German by M. Müller (Leip. 1844).

Under the Persian king, Nushirvan (531–79), the *Panchatantra* was translated into the Pehlvi tongue by his physician Barsuyeh, under the title of *Calilah and Dimnah* (from two jackals that take a prominent part in the first fable). This Pehlvi version has perished with all the profane literature of ancient Persia; but under the caliph Almansur (754–75), it was translated into Arabic by Abdallah-ibn-Almokaffa (published by De Sacy, Par. 1816). From Almokaffa's Arabic translation—in the introduction to which the author of the collection is called Bidpai, the chief of Indian philosophers—have flowed all the other translations and paraphrases of the east and west. Several Arabic poets worked it up into complete poems; and in the new Persian literature a great variety of versions and paraphrases, some in verse, some in prose, were made. From the Persian of Vaez (about the end of the 15th c.), the work was translated into Turkish about 1540 by Ali Chelebi, under the title of *Homayun-nâmeh*, the imperial book. There are also translations into the Malay, Mongol, and Afghan languages.

Towards the end of the 11th c., a translation had appeared, from the Arabic of Almokaffa, into Greek, by Simeon Sethus; and later, a Hebrew translation by Rabbi Joel, which John of Capua, a converted Jew, in the last half of the 13th c., retranslated into Latin with the title of *Directorium Humanæ Vitæ* (published first at Augs. 1480, and

repeatedly since). A version from this was made into German by Eberhard I., duke of Würtemberg (died 1325), which appeared with the title of *Examples of the Ancient Sages* (Ulm, 1483). Under Alfonso X. of Castile (1252–84), Almokaffa's work was translated into Castilian, and afterwards from that into Latin by Raymond of Veziers, a learned physician. The other European translations follow, some the Latin of John of Capua, some that of Raymond of Veziers; Spanish (Burgos, 1498), Italian (Flor. 1548), English (Lond. 1570), Dutch (Amst. 1623), Danish (Cop. 1618), Swedish (Stock. 1743), German (most recent, Leip. 1802).

BIEFVE, EDOUARD DE, b. 1808; a Belgian painter who studied with David d'Angers. He excels in portraits and historical compositions. By order of the government he produced the "Compromise of the Brussels Nobles of Feb. 16, 1566," which was greatly praised at the Paris exhibition of 1855. Some of his other works are "The Introduction of Rubens to Charles V.," "Massaniello," "Ugolino," "Raphael and La Fornarina," and "The Knights of the Teutonic Order recognizing the Elector of Brandenburg as their Grand Commander," done for the king of Prussia.

BIEL. See BIENNE.

BIEL, GABRIEL, b. about the middle of the 15th century. He was pastor at Mainz, and on the establishment of the university of Tübingen, in 1477, was appointed professor of theology, and twice afterwards rector. He was a follower of William of Occam. His work *Collectorium Super Libros Sententiarum G. Occami*, is a clear account of the nominalistic doctrine, and presents a complete system of scholastic thought regarded from that point of view. B. has been erroneously called "Ultimus Scholasticorum" (the last of the scholastics). He died in 1495.

BIELA, WILHELM VON, 1782–1856; a German astronomer and soldier, and major in the Austrian army; celebrated as the discoverer of a comet named after him, and for contributions to Schumacher's *New Astronomy*.

BIELA'S COMET, one of the comets of short period, named from its investigator, Wilhelm von Biela. Its periodic time is 6617 years. Its orbit was first determined on its appearance in 1826, and it was found to have been seen in 1772 and 1805. On its return in 1846 it was in two parts, separated by about 157,000 m., unequal in size, each having a distinct nucleus and tail. At the return in 1852, the parts were 1,250,000 m. asunder. Since then it has not been seen. It has been suggested that its orbit has crossed that of a meteoric shower, and that it has been broken up and dispersed as material for shooting stars.

BIELAU, a t. in Prussia, called LANGEN BIELAU, being the longest village (4 m.) in the state. It is important for cotton and other manufactures, and boasts of one old castle. Pop. '71, 13,070.

BIELEFELD, a busy t. of Westphalia, in Prussia, picturesquely situated on the Lutter or Lutterbach, at the foot of the Sparrenberg mountain, and about 26 m. s.w. of Minden. The broad ditch, which formerly surrounded B., is now converted into pleasant walks. The old walls of the town have been put to a similar use. The castle of Sparrenberg, erected in 1545 on the site of an old Guelphic fortress, and which now serves as a prison, is in the immediate neighborhood. B., which is the center of the Westphalian linen-trade, has extensive bleaching-grounds, manufactures of woolen thread, soap, leather, etc., and its meerschaum pipes are celebrated. Pop. '75, 26,574

BIËLEV', an ancient t. of European Russia, in the government of Tula, situated on the left bank of the Oka, in lat. 53° 45′ n., and long. 36° 5′ east. It has a large trade, and manufactures of soap, hardware, leather, etc. Pop. '67, 8123.

BIELITZ, a t. of Austrian Silesia, on the left bank of the river Biala, about 18 m. n.e. of Teschen. A bridge over the river connects it with the town of Biala, which is situated in Galicia. It has dye-works and print-fields, and carries on a large trade in woolens and kerseymeres with Russia, Poland, Hungary, and Italy. B. belongs to the princes Sulkowsky, whose castle, now converted into public offices, is situated here. Pop. '69, 10,721.

BIËLLA, a t. of n. Italy, in the province of Novara, about 38 m. n.e. of Turin, with which it is connected by railway. It is pleasantly situated on the Cervo, an affluent of the Sesia, and has manufactures of woolens, hats, paper, etc. Pop. with suburbs, '71, 11,814.

BIË'LO-OZ'ERO (the White lake), a lake in the government of Novgorod, Russia, lat. 60° 10′ n., long. 37° 30′ east. It is elliptical in shape, its length being about 25 m., and its breadth 20. Its bottom is composed of white clay, which, during stormy weather, gives to the water a milky appearance; hence, doubtless, the name White lake. B. is fed by numerous small streams, is pretty deep, and abounds with fish. Its surplus waters are conveyed by the Sheksna river into the Volga. Canals unite it with the Onega, Sukona, and Dwina.—B. OZERSK, an old wooden t. on the s. shore of the lake, formerly capital of an ancient principality of the same name, has a trade in cattle, corn, and pitch, and manufactures of candles. Pop. '67, 4467.

BIËLO'POL, a t. of Russia, in the government of Kharkov, and distant from the city of that name 106 m. n.w. It has a considerable trade and extensive distilleries. Pop. '67, 12,178.

BIELSHÖH'LE, a singular cavern in one of the Harz mountains, called Bielstein, on the right bank of the Bode, in the duchy of Brunswick, Germany. It was discovered in 1768. The entrance to it is more than 100 ft. above the bed of the stream. The cavern is divided into 11 main compartments, and contains a great deal of that curiously freakish work which nature delights to execute in stalactites, when she sometimes condescends to imitate the inventions of human art, as in the eighth division, where she has contrived to fashion the framework of an organ out of the slow drip of ages. In the ninth, there is also a picture of a sea, as it were, arrested in its motion, its waves silent, but in act to roll.

BIËLSK, a t. of Russia, in the government of Grodno. It is situated in a very fertile district, watered by the Narev and Nurzek, was formerly capital of a Polish palatinate, is well built, and has a fine custom-house. Pop. '67, 3985.

BIENHOA, a t. in Cochin China, capital of a province, 20 m. n.w. of Saigon, connected with that city by a canal. B. was taken by the French in 1861, and is now one of their fortified posts. Pop. of the "inspection" of B., 19,260.

BIENNE, or BIEL, a t. of Switzerland, in the canton of Bern, 17 m. n.w. of the city of Bern, beautifully situated at the foot of the vine-clad Jura, at the mouth of the valley of the Suze, and at the northern extremity of the lake of Bienne. It is surrounded by old walls, and approached by shady avenues. Pop. '70, 8113, engaged in the manufacture of watches, leather, cotton, etc. B. is a place of great antiquity. It belonged to the bishop of Bâle, or Basel; but as early as 1352, it entered into an alliance with Bern for the protection of its liberties, and for this display of independence was burned by its ecclesiastical ruler. The reformation, however, so weakened the power of the clerical governors of B. that in the beginning of the 17th c. it had become merely nominal; and B. was essentially a free and independent city until 1798, when it was annexed to France. In 1815, it was united to Bern.—B., LAKE OF, extends from the town of B. along the foot of the Jura mountains in a s.w. direction, until within 3 m. of lake Neuchâtel, its length being about 10 m., and its greatest breadth 3. It is situated at an elevation of 1419 ft. above the level of the sea, 8 ft. lower than lake Neuchâtel, whose surplus waters it receives at its s. extremity by the Thiel, by which river it again discharges its own. Its greatest depth is 280 feet. Towards its southern extremity is situated the island of St. Pierre, crowned with a grove of fine old oaks, to which Rousseau retired for two months after his proscription at Paris in 1765.

BIËNNIALS, or BIENNIAL PLANTS, are plants which do not flower in the first season of their growth, but flower and bear fruit in the second season, and then die. Many of our cultivated plants are B., as the carrot, turnip, parsnip, parsley, celery, etc., and many of the most esteemed flowers of our gardens, as stock, wallflower, etc. But plants which in ordinary circumstances are B., often become annuals (q.v.), when early sowing, warm weather, or other causes promote the earlier development of a flowering stem, as is continually exemplified in all the kinds already named. If, on the other hand, the flowering of the plant is prevented—or, in many cases, if it is merely prevented from ripening its seed—it will continue to live for a much longer period: the same bed of parsley, if regularly cut over, will remain productive for a number of years.

BIENVILLE, a parish in n.w. Louisiana; 1050 sq.m.; pop. '70, 10,636—5047 colored. It produces corn, cotton, and sweet potatoes. Co. seat, Sparta.

BIENVILLE, JEAN BAPTISTE LEMOINE, Sieur de; 1680–1768; one of the four brothers who were conspicuous in the exploration and settlement of the French province of Louisiana. The others were Iberville, Sauvolle, and Chateaugay, all sons of Charles Lemoine. With Iberville and Sauvolle, B. went from France in 1698, and made the first settlement at Biloxi. Leaving Sauvolle in command, B. went to explore the country, and in 1700 built a fort 54 m. from the mouth of the Mississippi. The next year he succeeded Sauvolle as governor or director of the colony, fixing the seat of government at Mobile. Chateaugay joined him in 1704 with 17 settlers from Canada, and 20 women arrived from France to be married to the colonists. B. was dismissed in 1707, but his successor died at sea and left him still in authority. With a view to improve the cultivation of the soil he proposed to the French government the exchange of Indians for negro slaves, giving three of the former for two of the latter. About this time the colonists were sorely pressed by famine, and in 1712 the king granted the monopoly of trade to Anthony Crozat, with liberty to import negroes from Africa. In 1713, Cadillac was made governor, and B. kept as lieutenant-governor. They quarreled, and Cadillac sent B. against the warlike Natchez tribe, expecting that he would be killed but he made friends with the Indians, who built a fort for him. In 1718, B. was made governor, and with the aid of men sent out by Law's "Mississippi company" founded the city of New Orleans, which became the seat of government in 1723. Recalled the next year, he went to France to answer certain charges, leaving the colony a code regulating slavery, prohibiting all religious except the Roman Catholic, and banishing

Jews. In 1726, he was removed, but re-appointed in 1733, and made lieut.gen. In 1743, he was finally superseded, and he passed the remainder of his life in France.

BIERSTADT, ALBERT, b. Germany, 1829; in 1831, his family came to America and settled in New Bedford. Having a taste for drawing, he went to Dusseldorf to study, and made sketching tours in Switzerland and Germany. In 1858, he accompanied the Lander expedition to lay out a wagon road from Missouri to the Pacific, and on that and subsequent visits accumulated material for the landscapes on which his artistic fame securely rests. Some of his more notable works are "The Rocky Mountains," "The Domes of the Yosemite," "Storm in the Rocky Mountains," "Emigrants Crossing the Plains," and "Sunlight and Shadow." His recent work has been mainly in the same style, along the Pacific coast. In 1871, he was elected a member of the St. Petersburg academy.

BIERVLIET, a village of the Netherlands, province of Zeeland, 13 m. e.n.e. of Sluis. It is deserving of mention as the birthplace of William Beukelzoon (q.v.), who in 1386 invented the method of curing herrings. In 1377, B. was detached from the mainland by an inundation, and still remains insular.

BIES-BOSCH, a marshy sheet of water of the Netherlands, between the provinces North Brabant and South Holland, formed in Nov., 1421, by an inundation which destroyed 72 villages and 100,000 people, and forming that part of the estuary of the Maas called Holland's Diep. It is interspersed with several islands.

BIFFIN. See APPLE.

BIF-RÖST, or BIF-RAUST (the "tremulous bridge"), the rainbow, which in Norse mythology was deemed to be a bridge between heaven (asgard) and the earth, or some say hell (hela). In the latter time the warriors of Muspelheim (land of fire) ride over the bridge to give battle to Odin and his associate gods; the bridge breaks down; the wolf Fenrir, the Midgard serpent, Loki, and all the followers of Hel, and the frost giants unite in the war. There is nothing in heaven or earth that shall be exempt from fear in that terrible hour. All the gods led by Odin come forth to war. The evil powers triumph, and the whole universe will be consumed with fire.

BI'GA, a Roman term applied in ancient times to vehicles drawn by two horses abreast; and commonly to the Roman chariot used in processions or in the circus. In shape it resembled the Greek war-chariot—a short body on two wheels, low and open behind, where the charioteer entered, but higher and closed in front.

BIGAMY. This is an offense which, although perfectly intelligible in itself to the popular and unprofessional understanding, is yet, with a due regard to the strict meaning of the word, extremely difficult, legally, to define. Blackstone objects to the use of it as a term descriptive of the offense in view; for he says it is corruptly so called, because B. properly signifies being *twice married*, which a man or woman may legally be; and he therefore prefers the term *polygamy*. B., however, even according to the literal meaning, was an offense, or rather disqualification, according to the canonists, who explained it to consist in marrying two virgins successively, one after the death of the other, or in once marrying a widow; and persons so offending or disqualified were held to be incapable of holy orders, and therefore B. was anciently considered a good counterplea to the claim of *benefit of clergy* (q.v.), although the law in that respect was afterwards altered by a statute passed in the reign of Edward VI., when, bigamists or no bigamists, the clergy resumed their strange privilege. Different views prevailed in more modern times, and at a period, too, when the restraints of ecclesiastical dogmas had been thrown off. It is known that certain of the leaders of the German reformation, including Luther, Melanchthon, Bucer, and Melander, did not withhold their consent from Philip, landgrave of Hesse, champion of the reformation, who, having lost conceit of his wife, had applied to the Protestant doctors for license to have another, and which license was not withheld, for the marriage took place, and was performed by Melander in presence of Melanchthon, Bucer, and others; and *privately*, as the marriage-contract bears, "to avoid scandal, seeing that, in modern times, it has not been usual to have two wives at once, although *in this case it be Christian and lawful.*" Whether Luther and the other Protestant doctors actually held views favorable to polygamy has been the subject of warm controversy (see sir William Hamilton's *Discussions on Philosophy and Literature*, 1852, 2d ed., 1853; and archdeacon Hare's *Vindication of Luther*, 1855). Sir William Hamilton asserts that Luther believed in "the religious legality" of polygamy, and wished it to be sanctioned by the civil authorities—an assertion, however, of which the promised proof never appeared. Archdeacon Hare, on the other hand, maintains that Luther and Melanchthon only held that in certain extraordinary emergencies dispensations from the usual law of marriage might be granted. Be that as it may, the conduct of the reformation leaders in this matter has been universally condemned, even by Protestants. The ideas referred to never gained ground in Germany; while in Great Britain "monogamy" not only continued an institution, but its violation was regarded as a serious offense, which continues to be treated in statutes, law-books, and in the practice of the criminal courts in the three kingdoms, under the name of *bigamy*. Nor, indeed, have the ideas referred to been followed by the Germans as a nation.

The first statute which distinctly treated this offense as a felony was the 1 James I. c. 11, which enacted that a person so convicted should suffer death. What now constitutes the English law regarding the crime of bigamy, is the 22d section of 9 Geo. IV. c. 31, passed in 1828. B. is there declared to be committed by "any person who, being married, shall marry any other person during the life of the former husband or wife, whether the second marriage shall have taken place in England or elsewhere"—a definition that appears to be adopted by the recent divorce act, the 20 and 21 Vict. c. 85, where, for the purpose of that act, B. is to be taken to mean "marriage of any person being married, to any other person during the life of the former husband or wife, whether the second marriage shall have taken place within the dominions of her majesty, or elsewhere." More correctly, however, the offense of B. may be said to consist in going through the *form* or *appearance* of a second marriage, while a first subsists, with a man or woman, against whom the most odious deceit and fraud is thus practiced, and upon whom, especially in case of a woman, the deepest injury is inflicted; for the second marriage is merely a marriage in form—no real marriage at all, because a man cannot have two wives, or a woman two husbands, at one and the same time. In prosecutions under this act, the first wife is not admissible as a witness against her husband, because she is the true wife; but the second may, because she is not only no wife at all, but because she stands in the position of being the party peculiarly injured by the bigamy. The same is the procedure in the case of a second husband. The act following the 1 James I. makes B. a felony, and prescribes as the punishment, upon conviction, transportation for seven years; now changed (by the 16 and 17 Vict. c. 99, amended by the 20 and 21 Vict. c. 3) to penal servitude for the same period, or not less than three years; or to be imprisoned, with or without hard labor, in the common jail or house of correction for any term not exceeding two years.

The act, however, excepts from its provisions the following four cases: 1. That of a second marriage contracted out of England, by any other than a subject of the realm. 2. That of any person marrying a second time, whose husband or wife shall have been continually absent from such person for the space of seven years then last past; and shall not have been known by such person to be living within that time. 3. That of a person who, at the time of such second mariage, shall have been delivered from the bond of the first marriage. 4. That of a person whose former marriage shall have been declared void by the sentence of any court of competent jurisdiction. The third of these exceptions deserves notice, in consequence of its bearing on a curious question that arose before the passing of the act, and which showed a serious conflict which then existed, if it does not still exist, between the laws of England and Scotland. The case referred to is known among lawyers as *Lolley's case*; it occurred in 1812, and may be shortly stated as follows: Lolly and his wife, two English persons, being tired of each other's conjugal society, and unable to bear the expense of the then English ordeal, went to Scotland, where, after acquiring a domicile, they applied to the Scotch consistorial court for a divorce, which was speedily (although it is said collusively) obtained, on the ground of the husband's adultery. Relying on such sentence of the Scotch court, Lolly returned to England, where he married again. He was immediately indicted for B., tried, convicted, and sentenced to seven years transportation, and that in the face of the Scotch decree of divorce, which he reasonably pleaded by way of defense. The point, however, was reserved for further consideration before the full court (court of Exchequer), who, however, shortly after gave a unanimous judgment holding that Lolly had been rightly convicted; or, in other words, that the Scotch court had no authority to dissolve an English marriage, and that the decree of divorce which Lolly had obtained, although good in Scotland, was of no force whatever in England. Many distinguished English lawyers were of opinion that the judgment of the English court was wrong, and that the Scotch divorce afforded him a complete defense. But it is to be observed that the prosecution was founded on the 1 James I. c. 11, to which we have referred, the 3d section of which only excepts from its provision persons divorced by "any sentence had in the ecclesiastical court," meaning, of course, the English ecclesiastical court; and thus some color at least is given to the view taken of Lolly's case by the court of Exchequer. But it may well be doubted whether such a conviction could take place in the face of the above third exception in the 9 Geo. IV., which excepts persons who shall have been divorced, not by any particular court or jurisdiction, but simply divorced from the bonds of the first marriage.

It remains to be added that under the 9 Geo. IV., not only the actual bigamist, but every person counseling, aiding, or abetting the offender, is held equally guilty, and may be sentenced to the same punishment; and by section 31, accessories before and after the fact are also severely punishable.

The 9 Geo. IV. does not extend to Scotland, but the law there on the subject of this particular offense is very much the same in principle, although the punishment there is not so severe as in England. There is an old Scotch statute, passed in 1551, which declares the punishment of B. to be the same as that of perjury; but the offense is also indictable at common law in Scotland, and in modern practice, it is usual so to deal with it, and to limit the punishment to imprisonment. See MARRIAGE, DIVORCE, POLYGAMY.

BIGAMY (*ante*). In the United States the laws concerning B. are nearly the same as in England, and are drawn in the main from the statute 1 James I., c. 11,

except in the matter of penalty, which differs in different states. It has been held in Massachusetts that a woman may be punished if she marries another person while her lawful husband lives, although he may have left her of his own motion and remained away any time less than seven years. In some states the defendant in a successful case of divorce who marries again is guilty of B., being by statute forbidden to marry; but little regard is paid to this prohibition. Indeed, the statutes of the several states affecting marriage and divorce are so various and conflicting that prosecutions for bigamy are exceedingly rare.

BIG BETHEL, in the peninsula between York and James river, Va., where, June 10, 1861, an irregular and undecisive battle took place between the union forces and the confederates. After a series of blunders and skirmishes, in which maj. Theodore Winthrop was killed while leading an assault, a retreat was ordered by the union gen. in command. The union loss was about 100, that on the confederate side but seven or eight.

BIG BLACK RIVER, in Mississippi, is about 200 m. long, running through a fine cotton region near the middle of the state, and joining the Mississippi at Grand gulf.

BIG BONE LICK, a salt spring in Boone co., Ky., where many bones of the mastodon and other extinct mammalia have been found.

BIGELOW, Erastus Brigham, ll.d., 1814–79; b. Mass.; inventor of looms for weaving suspender webbing, piping cord, knotted counterpanes, carpets, coach laces, etc. He founded the manufacturing village of Clinton, Mass., the head-quarters of the Bigelow carpet company. B. proposed, in 1862, a plan for uniform taxation throughout the United States, and wrote an essay on the tariff considered in regard to the policy of England and the interests of the United States. He was one of the original incorporators of the Massachusetts institute of technology, a trustee of the museum of fine arts, a member of the American academy of arts and sciences, of the Massachusetts historical society, of the London society for the encouragement of arts, manufactures, and commerce; and received the degree of a.m. from several New England colleges.

BIGELOW, Jacob, b. Mass., 1787; physician and botanist; graduated at Harvard in 1806. In early life he became proficient in botany, and published two works on the science. He was for more than 40 years physician to the Massachusetts general hospital, and for a long time professor of materia medica and clinical medicine in Harvard. In 1820, he was one of the committee of five who formed the *American Pharmacopœia*, and assisted in establishing the nomenclature which substituted a single for a double word when possible. B. was the originator of mount Auburn cemetery, the first of the large and beautiful places of interment now so numerous in this country. Besides many books and papers on botany and medical subjects, he has published poems, etc., and a volume of verse, entitled *Eolopoesis*, is ascribed to him. For many years he was president of the Massachusetts medical society. Of late, since abandoning active practice, he has devoted much attention to technical education and the substitution of practically utilitarian branches for classical study.

BIGELOW, John, b. New York, 1817; graduated at Union college in 1835, admitted to the bar in 1839, and soon after became a casual journalist and editor. In 1850, he joined William Cullen Bryant in the New York *Evening Post*, and was one of its principal editors until 1861, when he was appointed consul at Paris. On the death of Mr. Dayton he became United States minister in France, remaining until 1866. He has published *Life of Fremont, Some Recollections of the late Antoine Pierre Berryer*, and *Les Etats-Unis d'Amerique*, the latter in Paris.

BIGELOW, Timothy, 1767–1821; an American lawyer; a graduate of Harvard; for 20 years a member of the Massachusetts legislature, and for more than half that time speaker of the house. He was also a member of the Hartford convention.

BIGG. See Barley.

BIG HORN, a navigable river of the United States, rises near Fremont's peak in the Rocky mountains, about 42° 20′ n., and 110° west. It has a n.e. course of about 400 m., being the largest affluent of the Yellowstone, which, again, is the largest affluent of the Missouri.

BIG HORN, a co in s.e. Montana, on the Dakota and Wyoming borders; about 30,000 sq.m.; pop. '70, 38 whites. It is intersected by the Yellowstone and some of its tributaries

BIGHT (from the same root as the verb "to bow") is a sailor's name for the bent or doubled part of a rope. Thus, one anchor may "hook the B." of the cable of another, and thereby cause entanglement. In geography, B. has much the same sense as "bay."

BIGNONIA'CEÆ, a natural order of exogenous plants, containing trees, shrubs, and herbaceous plants, generally with compound leaves. The flowers are generally showy, ane are among the most striking ornaments of tropical forests. The corolla is of one petal, generally more or less trumpet-shaped and irregular; the stamens are 5 in number, or 4, with the rudiment of a fifth, and unequal. The ovary is free, seated on a disk, 1 or 2-celled; the fruit sometimes capsular, sometimes drupaceous; with few or many seeds. There are about 500 known species; which, however, are often regarded as

forming three distinct orders—*bignoniaceæ*, *crescentiaceæ*, and *pedaliaceæ*. Of these the *bignoniaceæ* are by far the most numerous, and are almost all tropical or subtropical, although a few are found in the United States of North America. See TRUMPET-FLOWER. They are in many cases noble trees, and some of them afford valuable timber, among which are *bignonia leucoxylon*, a tree of Jamaica, the green or yellow wood of which is sometimes brought into the market under the name of ebony; and the ipe-tobacco and ipe-una of Brazil, species of the same genus, the former of which is used for ship-building, and the latter is accounted the hardest timber in Brazil. Not a few of them are climbing shrubs, and the tough shoots of *bignonia cherere* are used for wicker-work in Guiana. *Bignonia alliacea*, a native of the West Indies, is remarkable for its strong alliaceous smell; the leaves of *bignonia chica* afford the red coloring matter called chica (q.v.).—The *crescentiaceæ* chiefly abound in Mauritius and Madagascar. The calabash tree (q.v.) is the best known example.—The *pedaliaceæ* are tropical or subtropical; many of them herbaceous plants. The most important is Sesamum (q.v.). The fleshy sweet root of *craniolaria annua* is preserved in sugar as a delicacy by the Creoles.

BIG SANDY RIVER, a fine navigable affluent of the Ohio, flows through extensive beds of coal. It is formed by the junction of two branches—the east and west forks—which both rise in Virginia. The latter traverses several counties of Kentucky, and the former is, during the latter part of its course, the boundary between the two states. Their united waters lose themselves in the Ohio, nearly opposite to Burlington, in the state of Ohio.

BIG STONE, a co. in s.w. Minnesota, on the Minnesota river and the Dakota border; 450 sq.m.; pop. '80, 3,689. Co. seat, Ortonville.

BIHACH', or BICHACZ', one of the strongest fortress towns of Turkish Croatia, in Bosnia, is situated on an island in the Una, in lat. 44° 42′ n., and long. 15° 53′ e., near the frontier of Dalmatia. It has been the scene of frequent contests during the Turkish wars. Formerly, it was possessed of a Christian church, but that has been completely destroyed by fanatic Mussulmans. Pop. 3000.

BIHAR, a co. in Hungary, e. of the Theiss; 4280 sq.m.; pop. '70, 557,337, mainly Magyars and Wallachians. The soil is generally fertile, and the people are rich in horses, cattle, and sheep. Gross-Wardien and Debreczin are the largest towns.

BIJANAGHUR' meaning, it is said, *the city of triumph*, is a ruined city within the presidency of Madras, being in lat. 15° 19′ n., and long. 76° 32′ e. It stands about 40 m. to the n.w. of Bellary, in a plain encumbered with granite rocks, many of which have been rudely sculptured into a variety of forms. After having been for two centuries the metropolis of a powerful Hindu kingdom, B. was sacked and ruined by the Mohammedans of the Deccan in 1564. Even now it presents traces of its grandeur, being 8 m. in circuit, and containing many edifices, both temples and palaces, of granite.

BIJAPORE', a t. of India, in Guzerat, in the Guicowar's territory, on the route from Mhow to Deesa, 200 m. n.w. from Mhow, and 60 m. s.e. from Deesa. Pop. 12,000.

BIJAPORE', BIJAPUR, or BIJAIPUR (*ante*), the ancient capital of an independent sovereignty in India, of the same name, once an extensive and opulent city, but now with mere vestiges of its old grandeur. It is on a fertile plain, 16° 50′ n., 75° 48′ e., and is still a town of great extent. The citadel, a mile in circuit and very strong, was built in 1849, and its defenses, 6 m. in circumference, were completed in 1566. Outside of the fort are the remains of a large city. The natives say that according to ancient records, B. once contained 1600 mosques and 1,000,000 houses. The outer wall of the city was of stone, about 20 ft. high and prodigiously thick, with ditch and rampart, and towers of stone at intervals of 100 yards. The great mosque, in the fort, was 200 ft. long by 165 wide, with wings 219 by 45 feet. The mosque and mausoleum of king Ibrahim Adil Shah, completed about 1620, was 36 years in building, and is reported to have cost $8,500,000. It is 115 by 76 ft., covered by an immense dome raised on arches. Among the curiosities of B. is the immense cannon, said to be the largest piece of cast brass ordnance in the world, captured from the king of Ahmadnagar by the king of B. in the 17th century. It is 14 ft. long, 28 in. caliber, and would carry a ball of 1600 pounds. The town is 245 m. s.e. of Bombay.

BIJAWUR, a petty native state in the Bundelcund agency, with an area of 920 sq.m., and a pop. of 102,000.

BIJBAHAR', one of the best-known towns in Cashmere, though not one of the most populous. It is situated on the banks of the Jhelum, about 25 m. to the s.e. of the metropolis, being in lat. 33° 47′ n., and 75° 13′ e. The only particular worthy of notice is a wooden bridge across the Jhelum, which, notwithstanding its simplicity, has endured for centuries, in consequence of the tranquil and equable weather of the valley. Pop. 2262.

BIJNOUR', a t. of India, the chief t. of the British district of the same name, n.w. provinces, in 29° 22′ n. lat., and 78° 11′ e. longitude. It is on the route from Mora-

dabad to Mozuffurnuggur, 31 m. e. from Mozuffurnuggur. Pop. '71, 12,566.—The district of Bijnour has an area of 1884 sq.m., and a pop. (1871) of 737,152.

BIKANIR', or BEEKANEER, a t. of India, the capital of a Rajpoot state of the same name, in n. lat. 28°, e. long. 73° 22'. It is situated in a singularly desolate tract, hard, stony, and utterly unfit for cultivation. The town is surrounded with a battlemented wall, and has a very imposing appearance. The pop. is estimated at 60,000.—The state of Bikanir extends from n. to s. about 160 m., and from e. to w. about 200 miles. Its area is 24,000 sq. miles. The climate is remarkable for extreme changes of temperature, the temperature during the night being often very cold, whilst the day is very hot. Ice is often formed on ponds in winter during the night, whilst the summer heat during the day sometimes reaches 123° Fahrenheit. The majority of the population are by descent Jauts, a people inhabiting from a very remote period a great extent of country between the Himalaya and the Indian ocean. The rajah and dominant race are Rajpoots. Bramans are numerous, but if they do not eat, they trade in oxen. There are many Jains. The burning of widows was in former times extremely prevalent in Bikanir. One corpse is said to have been burned with 84 victims. The annual revenue of the state is about £65,000. The military force amounts to about 5000. The pop. is about 300,000.

BIKH. See ACONITE.

BI'LANDER, or BI'LANDRE, is a small two-masted merchant vessel, distinguished from others chiefly by a peculiar shape and arrangement of the main-sail. Of these vessels, which were probably French in origin, there are not many now remaining.

BILBA'O, a seaport t. of Spain, capital of the province of Vizcaya (Biscay), is situated in a mountain gorge on the Nervion, about 6 m. from its mouth at Portugalete, in lat. 43° 14' n., long. 2° 56' west. B. is well built; the principal streets are straight, and the houses substantial. Four bridges, one of iron, opened in 1868, and a stone bridge of the 14th c., cross the river, which divides the old town from the new. There are several fine public walks, numerous fountains, but no public buildings of any note. The city is purely commercial. It has many extensive rope-walks and manufactures of hardware, leather, hats, tobacco, and earthenware. There are also docks for building merchant-vessels, and in the vicinity are iron and copper mines. Pop. 19,000. In 1864, a railway was opened to Tudela. Small vessels can navigate the river quite up to the town, but large vessels have to anchor at Portugalete. The total tonnage of the ships that entered B. in 1870 was 160,952. The imports consist chiefly of cotton and woolen manufactures, colonial produce, fish, jute, spirits, hardwares, machinery, railway materials, etc.; and the exports consist of wool, iron, fruits, oil, flour and grains, wines, madder, minerals, liquorice, etc. There are more than 200 commercial houses in Bilbao. The women here do almost all of the heavy porterage. B. was founded in the year 1300 by Diego Lopez de Haro, under the name of Belvao, i.e., "the fine fort," and being well situated, and little disturbed by the civil wars of Spain, it soon attained great prosperity. In the 15th c., it was the seat of the most authoritative commercial tribunal in Spain. It suffered severely in the wars with France, first in 1795, and again in 1808, when 1200 of its inhabitants were slaughtered in cold blood. During the Carlist struggles, B. was often besieged, last in 1874.

BILBERRY. See WHORTLEBERRY.

BIL'BILIS, an old Iberian city of Spain, about 2 m. e. from the modern town of Calatayud, in the province of Saragossa, chiefly celebrated as the birthplace of the poet Martial, but also famed for its highly tempered steel blades. Quintus Metellus won a victory over Sertorius here; and B., under the Romans, was a municipal town with the surname of Augusta. Several of its coins, struck off during the reigns of Augustus, Tiberius, and Caligula, are still in existence—some in the British musuem.

BIL'BOES are long bars or bolts of iron, with shackles sliding on them, and a lock at one end. When an offender on shipboard is put "in irons," it implies that B. are fastened to him, more or less ponderous according to the degree of his offense. The B. clasp the ankles in some such way as handcuffs clasp the wrist.

BIL'COCK. See RAIL.

BILDERDIJK, WILLEM, a Dutch poet and philologist, of much repute in his day, was b. at Amsterdam, 7th Sept., 1756. While studying law at Leyden, and afterwards, when practicing at the Hague, he devoted himself assiduously to literature and poetry. On the invasion of Holland by the French, he repaired to Brunswick, and afterwards visited London, where he supported himself by lecturing and teaching. In the year 1806, he returned to Holland, where he was received as one who had done his country honor; and the newly elected king of Holland (Louis Bonaparte) appointed him president of the institute at Amsterdam, just then organized after the fashion of the one at Paris, and also made him his own instructor in the Dutch language. B. afterwards resided at Leyden, and then at Haarlem, where he died, 18th Dec., 1831. His contributions to poetic literature were very numerous; but though they contain many beauties, yet, with one or two exceptions, none of his poems display any remarkable originality, or any great wealth of imagination. With his poetical pursuits he combined the theoretical

study of his native language; and his writings on this subject are valuable contributions to the exposition of the older monuments of Dutch literature.

BILE is a fluid secreted from the blood by the liver. One part of it is destined to serve in the process of digestion; the other to be eliminated from the system. It is colored yellow in man; that of graminivorous animals seems colored by the leaves they feed upon. The primary cells of the liver (the hepatic cells) separate the B. from the blood of the portal vein, and discharge it into small ducts, which unite to form larger ones, and eventually the right and left hepatic ducts. The latter unite to form the common hepatic duct, which is soon joined by that of the gall-bladder (the cystic duct). This junction forms the common B. duct, which pierces the second part of the duodenum, and running obliquely in its wall for a short distance, opens on its mucous surface.

The secretion of B. is constantly going on, and if there is food in the intestine, the bile mingles with it, and dissolves the fatty portions, preparatory to their absorption, the excrementitious portion of the B. passing out of the body with the other indigestible materials. When the bowel is empty, the B. ascends the cystic duct, and is stored for future use in a small flask-like bag (the gall-bladder) situated under the liver.

Should, from any cause, the elements of the B. be in excess in the blood, or should the liver suspend the function of secreting it, not only is digestion imperfectly performed, but the general health suffers from the impure condition of the blood, and the patient is said to be *bilious*. On the other hand, the B. may be secreted, but its escape interfered with, and then its reabsorption will produce jaundice (q.v.) Its solid portions, again, especially the cholesterine, may be in excess, solidify, and produce biliary calculi or gall-stones. See CALCULUS.

In *chemical composition*, B. is essentially a soap analogous to resin-soap, and as obtained from the ox, contains in 100 parts,

Water	90.44
Biliary and fatty bodies, including resinoid acids	8.00
Mucus	0.30
Watery extract, chlorides, phosphates, and lactates	0.85
Soda	0.41

The soap is formed from the union of the resinoid acids (*glycocholic* and *taurocholic acids*) with the soda. Human B. has the specific gravity of about 1026 (water = 1000), is of a ropy consistence, with a yellowish-green color; does not readily mix with water, but sinks therein, and only after repeated agitation becomes diffused through the water, which then assumes a frothy appearance resembling soap-suds. B. has a bitter taste, and a very sickening musky odor. It is interesting to observe that the B. of salt-water fishes contains potash in place of soda; although from their being surrounded by much common salt (chloride of sodium) in the sea-water, we should naturally expect to find soda in abundance; and the B. of land and fresh-water animals contains soda, while, considering diet and habitat, potash might more naturally be looked for in largest quantity. B. performs several important functions in the animal economy, which will be found treated of under the article DIGESTION; see also the articles LIVER and JAUNDICE.

BILED-UL-JERID. See BELED-EL-JEREED.

BILFINGER, or BÜLFFINGER, GEORG BERNHARD, 1693–1750; son of a Lutheran minister of Würtemberg, and, like several others of his family, born with twelve fingers and twelve toes. B. studied philosophy and theology in Tübingen, where he became preacher to the castle. He gained the prize (1000 crowns) offered by the academy of science of Paris for a solution of the problem of the cause of gravity. Later in life he was a privy councilor in Würtemberg, and greatly advanced the interests of public instruction and agriculture.

BILGE, sometimes called BULGE, is the part of the bottom of a ship nearest to the keel, and always more nearly horizontal than vertical. A ship usually rests on the keel and one B. when aground. The name of *bilge-water* is given to any rain or sea water which trickles down to the B. or lowest part of a ship, and which, being difficult of access, becomes dirty and offensive.

BILGEWAYS are timbers which assist in the launching of a ship; for which, see LAUNCH.

BILIARY CALCULI See CALCULUS.

BILIMBI. See CARAMBOLA.

BILIN, a t. of Bohemia, beautifully situated in the valley of the Bila, 17 m. w. of Leitmeritz, and famous for its mineral springs, the waters of which it exports to the extent of 500,000 jars annually. It has a manufactory of cotton yarn, and two castles, an old and a new one. In its vicinity there is a remarkable isolated clinkstone rock, called Borzenberg, or Biliner Stein; and the Tripoli earth found at B. has been shown by prof. Ehrenberg to be the remains of infusoria. Pop. about 4000.

BILIOUS FEVER. See LIVER.

BILL, in natural history, the hard, horny mouth of birds (q.v.). It consists of two *mandibles,* an upper and a lower, into which the upper and lower jaws are respectively produced, all appearance of lips being lost. It is not furnished with proper teeth, although rudiments of them have been observed in some of the parrot tribe in the fetal state, and the marginal laminæ with which the bills of many water-fowl are furnished, partake of the same character, being secreted by distinct pulps. The resemblance of these marginal laminæ to teeth is particularly marked in the goosander (q.v.). The bills of birds differ much, according to their different habits, and particularly according to the kind of food on which they are destined to live, and the manner in which they are to seek it. In birds of prey, the B. is strong; the upper mandible arched or hooked, and very sharp; the edges sharp, often notched, and the whole B., or *beak,* adapted for seizing animals, and tearing and cutting to pieces their flesh. A powerful, short, hooked beak, sharp-edged and notched, indicates the greatest courage and adaptation to prey on living animals. The beak of the vulture is longer and weaker than that of the eagle or falcon. In birds which feed on insects and vegetable substances, the hooked form of the B. is not found, or it is in a very inferior degree; those birds which catch insects on the wing, such as the goat-suckers, are remarkable for the deep division of the B., and their consequently wide gape, and an analogous provision to facilitate the taking of prey is to be observed in herons, kingfishers, and other fishing-birds; but the object is attained in their case by the elongation of the B., whereas birds which catch insects on the wing have the B. very short. Birds which feed chiefly on seeds have the B. short and strong, for bruising them; whilst the B. of insectivorous birds is comparatively slender. Many aquatic birds have broad and comparatively soft and sensitive bills, with laminæ on the inner margin for straining the mud from which much of their food is to be extracted; other birds, as snipes, avocets, etc., seeking their food also in mud, have slender bills of remarkable sensibility. The modifications of form are very numerous, and the peculiarities of the bills of toucans, hornbills, spoonbills, crossbills, parrots, humming-birds, etc., are very interesting, and intimately connected with the habits of the different creatures. (See these articles.) At the base of the upper mandible, a portion of the B. is covered with a membrane, called the *cere* (Lat. *cera,* wax, from the waxy appearance which it presents in some falcons, etc.), which in many birds is naked, in others is feathered, and in many is covered with hairs or bristles. The nostrils are situated in the upper mandible, usually in the cere, but in some birds they are comparatively far forward, and in some, as puffins, they are very small and placed so near the edge of the mandible, as not to be easily detected. They are more or less open, or covered with membrane, or protected by hairs or feathers. Besides their principal use for seizing and dividing or triturating food, the bills of birds are employed in a variety of functions, as dressing or preening the feathers, constructing nests, etc. They are also the principal instruments used by birds in their combats.

The mouths of some fishes and reptiles assume a character somewhat analogous to that of the B. of birds.

BILL, in its general acceptation, means a formal written paper or statement of any kind; originally, it was applied to any sealed document, being derived from Lat. *bulla,* a seal. It has a number of technical applications, for which see the articles that immediately follow.

BILL, or BROWNBILL, the main offensive weapon of English infantry until the substitution of fire-arms; a two-edged, sickle-shaped knife or sword, weighing from 9 to 12 lbs., on a handle 3 or 4 ft. long, and wielded with both hands. It had terrible power, sometimes taking off a person's head or cutting a man in two in spite of the strongest armor. It was also called a "glaive."

BILL, in legislation, the common name for a proposed but not consummated legislative act. In congress and in state legislatures laws usually first appear in the form of bills; they are read once or twice, and referred to the committee having charge of the subject to which they relate; e.g., a bill to amend the tariff would go to the committee on commerce. If the committee report unfavorably, the bill is ordinarily dropped or withdrawn; but if they report without objection, or favorably, it is referred to the committee of the whole for discussion, and reported from that committee to the house. After it has passed both houses, it goes to the committee on engrossed bills, who see that a correct copy is made for the signature of the president or governor, and if signed (or not returned within a time fixed by law, usually 10 days), the "bill" becomes a "law." If returned without approval, two thirds of all the members elected to each house (the houses voting separately) can enact it over the president's or governor's objections. Bills for raising revenue (in congress) must originate in the lower house, but the senate may propose and make amendments.

BILLARDIE'RA, or AP'PLEBERRY, a genus of twining Australian shrubs of the natural order *pittosporaceæ* (q.v.). They have simple alternate evergreen leaves, and axillary pendulous flowers. The flowers have a calyx of five sepals, and a bell-shaped sorolla of five petals. The fruit is a soft, spongy pericarp, with inflated cells, and many seeds which lie loose in the cells, terminated by the style, and generally bluish when ripe. It is eatable, although not destitute of a resinous character, which prevails in the

order. *B. longiflora* and *B. ovalis*, the former with nearly globose, the latter with oval fruit, are frequent ornaments of British greenhouses. The fruit of *B. mutabilis* is larger, cylindrical, and of a pleasant subacid taste.

BILLAUD-VARENNE, JEAN NICOLAS, a leader in the reign of terror in the French revolution; took an active part in the September massacres; entered the convention, where he distinguished himself for his violence against the king and the royal family, and his general unfeeling cruelty. He was the author of the revolutionary tribunal, and it was on his proposal that the duke of Orleans, the queen, and a host of others became its victims. He joined in the end in bringing about the fall of Robespierre, but could not ward off his own accusation as one of the terrorists, and was transported to Cayenne, where he lived about 20 years, rejecting the pardon offered by the first consul. In 1816, he came to New York, but was coldly received, and then sought an asylum in Hayti, where he died, 1819.

BILL-BROKERS are persons who, being skilled in the money-market, the state of mercantile and personal credit, and the rates of exchange, engage, either for their own profitable adventure, or that of their employers, in the purchase and sale of foreign and inland bills of exchange, and promissory-notes. They are to be distinguished from discount-brokers, or bill-discounters, whose business consists in discounting bills of exchange and notes which have some time to run before they come due, by means of the funds, or on the faith of the credit of capitalists or other persons having the command of money. See BROKER, BILL OF EXCHANGE, PROMISSORY-NOTE.

BILL-CHAMBER is a particular department of the court of session in Scotland (coeval with the establishment of that court itself in 1532), the business of which corresponds, in many respects, to the practice of the judges' chambers in England. It is called the B., because, formerly in Scotland, judicial proceedings were for the most part commenced by a writ called a bill, which was the skeleton or draft of the legal process which it was sought to have issued, and which bill was obtained in this particular department of the court. For such purpose, as well as for other matters which do not admit of delay, the B. accordingly sat, as it continues to sit, all the year round, and as in England, it is presided over by a single judge. This judge, to whom for the time are delegated the whole powers of the court, is called the lord ordinary on the bills, and during the sittings of the court of session, the duty is taken by the junior or last appointed judge of the court; but in vacation time, the business of the B. is performed in rotation by the six judges of the court who are not justiciary or criminal judges. In case of the indisposition or absence of any of these six judges, any judge of the court of session may act for him. A recent act, the 20 and 21 Vict. c. 18, now regulates many of the details of the procedure.

The business of the B. consists of all matters of a summary nature; and generally all cases requiring the immediate interposition of judicial authority are proceeded with, in the first instance, in the bill-chamber. Applications for interdict or injunction, and for warrants necessary for the execution of process, are there at once made. The preliminary procedure by way of appeal from inferior courts, and in order to stay execution on the judgments of these tribunals, also takes place, in the first instance, in the bill-chamber. Matters of bankruptcy or sequestration are also adjudicated on in this department. But the decision of the judge or lord ordinary officiating in the B., may, with some exceptions, be brought under review of the court; and the judgment of the court itself thus sitting on B. cases, may be brought before the house of lords by appeal, as in ordinary cases. See COURT OF SESSION, JUDGE'S CHAMBERS.

BILLET, in architecture, an ornament belonging to the Norman style. It was formed by cutting a molding—generally a round molding—into notches, so that the parts left resembled billets of wood. When used in several rows, the billets and empty spaces are placed interchangeably.

BILLET, in heraldry. Billets are small oblong figures, sometimes taken to represent bricks, but more commonly *billets doux*. The latter interpretation, which is that of Guillim, is generally adopted by English heralds, and is supported by the authority of Colombiere. The former again, which has the *Trésor Héraldique* and sir George Mackenzie on its side, is further strengthened by the fact that in German they are called *Schindeln*, shingles.

BILLETING is a mode of provisioning and lodging soldiers when not in camp or barrack. It is one of the many vexed questions connected with the organization and administration of the British army. When in camp or barrack, the soldier is supplied with hot food daily by the commissariat officers; or rather, with undressed food, and the means for cooking it. But when it is necessary to keep soldiers for one or more days in a town unprovided with barracks, a difficulty occurs which has never yet been properly surmounted; a burden is sure to rest on some one who is unwilling to bear it. In the early times of our history, monarchs were often wont to quarter their troops on the monasteries. In later times, the soldiers often compelled the inhabitants of towns to receive and support them; and the authorities were either unable or unwilling to prevent this. The mutiny act, passed for the first time in 1689, put a stop to this pernicious practice, by declaring that no housekeepers should be compelled to accommo-

date soldiers except on some recognized and fairly administered system. The chief civil magistrate of a town, on requisition from the military authorities, quartered the soldiers on the inhabitants as fairly as he could. This continued in England until 1745, when all kinds of persons were exempted from this burden except certain traders; and the new system has been maintained with minor alterations ever since. The alteration was not made in Scotland until 1857.

At present, the persons liable to have soldiers billeted on them, are the keepers of public-houses, hotels, inns, ale-houses, beer-shops, wine-shops, spirit-vaults, livery-stables, and such like licensed houses. There are certain exceptional cases provided for; and in and near London there are special regulations concerning the B. of the guards; but the general rule is as here stated. The persons liable are bound to accommodate soldiers, under a system that may be described in a few words. When troops are on the march from one barrack or station to another, and cannot cover the distance in one day's railway or foot traveling; or when they are to remain for a few days in a town unprovided with barrack accommodation, or where the barracks are already occupied—the commanding officer sends previously to the chief civil magistrate, and demands *billets* for a certain number of men for a certain time. The magistrate has a list of all the houses subjected to the B. system, and he quarters the men on those houses as fairly as he can. Rules are laid down to prevent the magistrate from B. too many soldiers on one house: any excess in this way is remediable at the hands of a justice of the peace. The billets are pieces of paper prepared under these rules. On the evening before the arrival of the troops, two or three non-commissioned officers enter the town, and present an order for the delivery of the billets to them, in order that no delay may arise when the main body enter. After the arrival, the soldiers go to the houses on which they are billeted: all those belonging to one company being quartered as near together as may be, for convenience of muster; and the sick are billeted near head-quarters. The licensed victualer, or other person, is bound to provide each billet-holder with food, drink, bed, and accommodation, either in his own house or somewhere near at hand. A specified sum of 10*d.* per day is allowed for this; or, under other circumstances, a trifling sum per day is allowed for fire, candles, cooking-utensils, salt, and vinegar. The sum per day allowed for hay and straw for a horse varies with the price of forage. The officers visit the houses, to see that the men really have one hot meal per day, instead of taking the value of it in money. The soldier may demand facilities for cleaning his arms and accouterments. The financial officer of the regiment makes the payments. There are often unpleasant disputes between the innkeeper or others, on the one side, and the officers of the regiment on the other, concerning the occupancy of the "best room," and on minor details. The militia are frequently billeted like the regulars.

There being many untoward circumstances connected with this system, a committee of the house of commons, in 1858, sought how best to remove them. In their report, the committee could not recommend the cessation of the B. system altogether, but they pointed out certain possible ameliorations; and since that, by camping out the troops and other means, great efforts have been made to reduce B. to a minimum.

BILL, EXCHEQUER. See EXCHEQUER BILLS, *ante*.

BILLIARDS (in Fr. *billard*, which meant originally the stick or staff with which the ball is struck, and is allied to Fr. *billot*, a block or billet of wood). It seems doubtful whether we are indebted for the discovery of this elegant game to France or Italy; but it is certain that it was imported hither from the former country. It must have been known, at all events by name, to Englishmen as early as the 16th c., since Shakespeare speaks of it; although when he represents Cleopatra as amusing herself with B. in Egypt, it is probable that he commits an anachronism. It is certain that the rectangular slate-table, with its resilient sides, covered with green cloth, and furnished with the six brass-bound pockets, the three ivory balls, and that long array of cues with leathern tops, so familiar nowadays to almost every eye, are paraphernalia of quite modern production. For two centuries, B. was played with only two balls; and when the third or red ball was imported from France, the red winning hazard—that is to say, the holing of the red ball—was almost the sole object of the performers. The cushions also, now universally constructed of india-rubber, up to a recent date were lined with felt. In no game are knowledge and manual dexterity so combined as in B., nor can the spectacle of first-rate play be appreciated, or the difficulties which it overcomes be understood, except by those who have a scientific as well as practical acquaintance with the game.

A billiard-table varies in size, but it is generally about 12 ft. long and 6 ft. wide. It is covered with fine green cloth, and set round with cushions, to keep the balls upon the table and make them rebound. The six holes or pockets are placed at the four corners and in the middle, opposite to each other, to hold the balls, which, when played into them, are called "hazards." The cues are long smooth sticks, with one end thick, and the other pointed; and the small end is covered with leather. The maces—slender sticks with a club at one end, adapted for pushing—are rarely taken in hand except by tyros and ladies, the butt-end of the cue, when the point cannot conveniently be used, being commonly employed instead. The three balls are of ivory, ranging from 1 in. to 1¼ in. in diameter, and two of them are white, and one is red. One of the former has a spot upon it; and when two persons are playing, he who uses the spot ball is called

spot, and he who uses the plain ball, plain. The cue is held in the right hand, and supported, in playing, by the forefinger and thumb of the left so placed as to form a "bridge;" and the ball is struck with the point of the cue, which is chalked, to prevent its slipping. On a certain mark on the cloth, at the distance of about a foot from one end of the table, and exactly in its center, the red ball is placed before commencing the game. At the other or lower end, and at the distance of about 2 ft. from it, a line is drawn across the table; and from the center of this line a semicircle is described between it and the lower end, of about 20 in. diameter. The space within this semicircle is called *baulk*. The object of the player is, by striking his own ball against the red ball or his adversary's, to drive either it or them into the pockets; or else to make a "cannon"—that is to say, to strike both balls with his own. The score is usually recorded by a third person, by means of a marking-board. The game of B. can be played by two, three, or four persons, and in a great many different fashions; but it is most commonly played by two, and the ordinary game is that called the *cannon*, or more properly *carambole*, introduced from France at the same time with the third or red ball. The technical term "cannoning" may perhaps have arisen from "caramboling," which was the old word for striking both balls with your own. The method of play is as follows:

1. The limit of the game is properly 21, though it is sometimes made 24, 50, 63, 100, or more, as may be agreed upon before commencing. The shorter games were probably used when billiard-tables were rarer, so that persons waiting for the use of them might sooner have their turn; 50, or "50 up," as it is called, is now the most usual limit.

2. For the lead and choice of balls, the players *string*—that is to say, placing their balls within the semicircle, they strike them against the furthermost cushion, in order to see which will return nearest the cushion next to them: the owner of the ball so placed, provided it does not strike the other ball, has then the option; but after the first match, the winner of each game leads.

3. The red ball on the spot at the upper end is replaced there on being put into a pocket, knocked off the table, or when the balls are "broken" (see 19) after a foul stroke; but should any ball be on the spot, or so near to it as to prevent the red being placed there without touching the ball, the red must be placed in the center of the table.

4. The points of the game are these: 1 for a miss, 2 for a cannon, 2 for a white hazard, 3 for a red hazard, and 3 for "running a coo;" but the miss and the coo count for the adversary.

5. A white winning hazard is made when you play at the white ball and pocket it; a white losing hazard, when you pocket your own ball off the white. These names of "winning" and "losing," were used in the old game of B. with two balls, but their meaning is now reversed, it now being commonly a *dis*advantage to make a winning hazard; and *vice versâ*.

6. A red winning hazard is when you pocket the red; a red losing hazard, when you pocket your own ball off the red.

7. A cannon is when your ball strikes the other two.

8. A miss is when your ball strikes no other.

9. A coo is when your ball goes into a pocket, or jumps off the table without striking another.

10. A four-stroke is made by playing at the white, making a cannon, and pocketing your own or adversary's ball; or by pocketing his and your own without the cannon, or by playing at the red, making a cannon, and pocketing your opponent's ball.

11. A five-stroke is made by playing at the red, making a cannon, and pocketing your own or the red; or by pocketing the red and your adversary's ball without the cannon; or by pocketing your own and adversary's ball off the red; or by playing at the white, making a cannon, and pocketing the red; or by playing at the white, and pocketing your own and the red.

12. A six-stroke is made by playing at the red, and pocketing it and your own; or by striking the white first, making a cannon, and pocketing your own and adversary's ball.

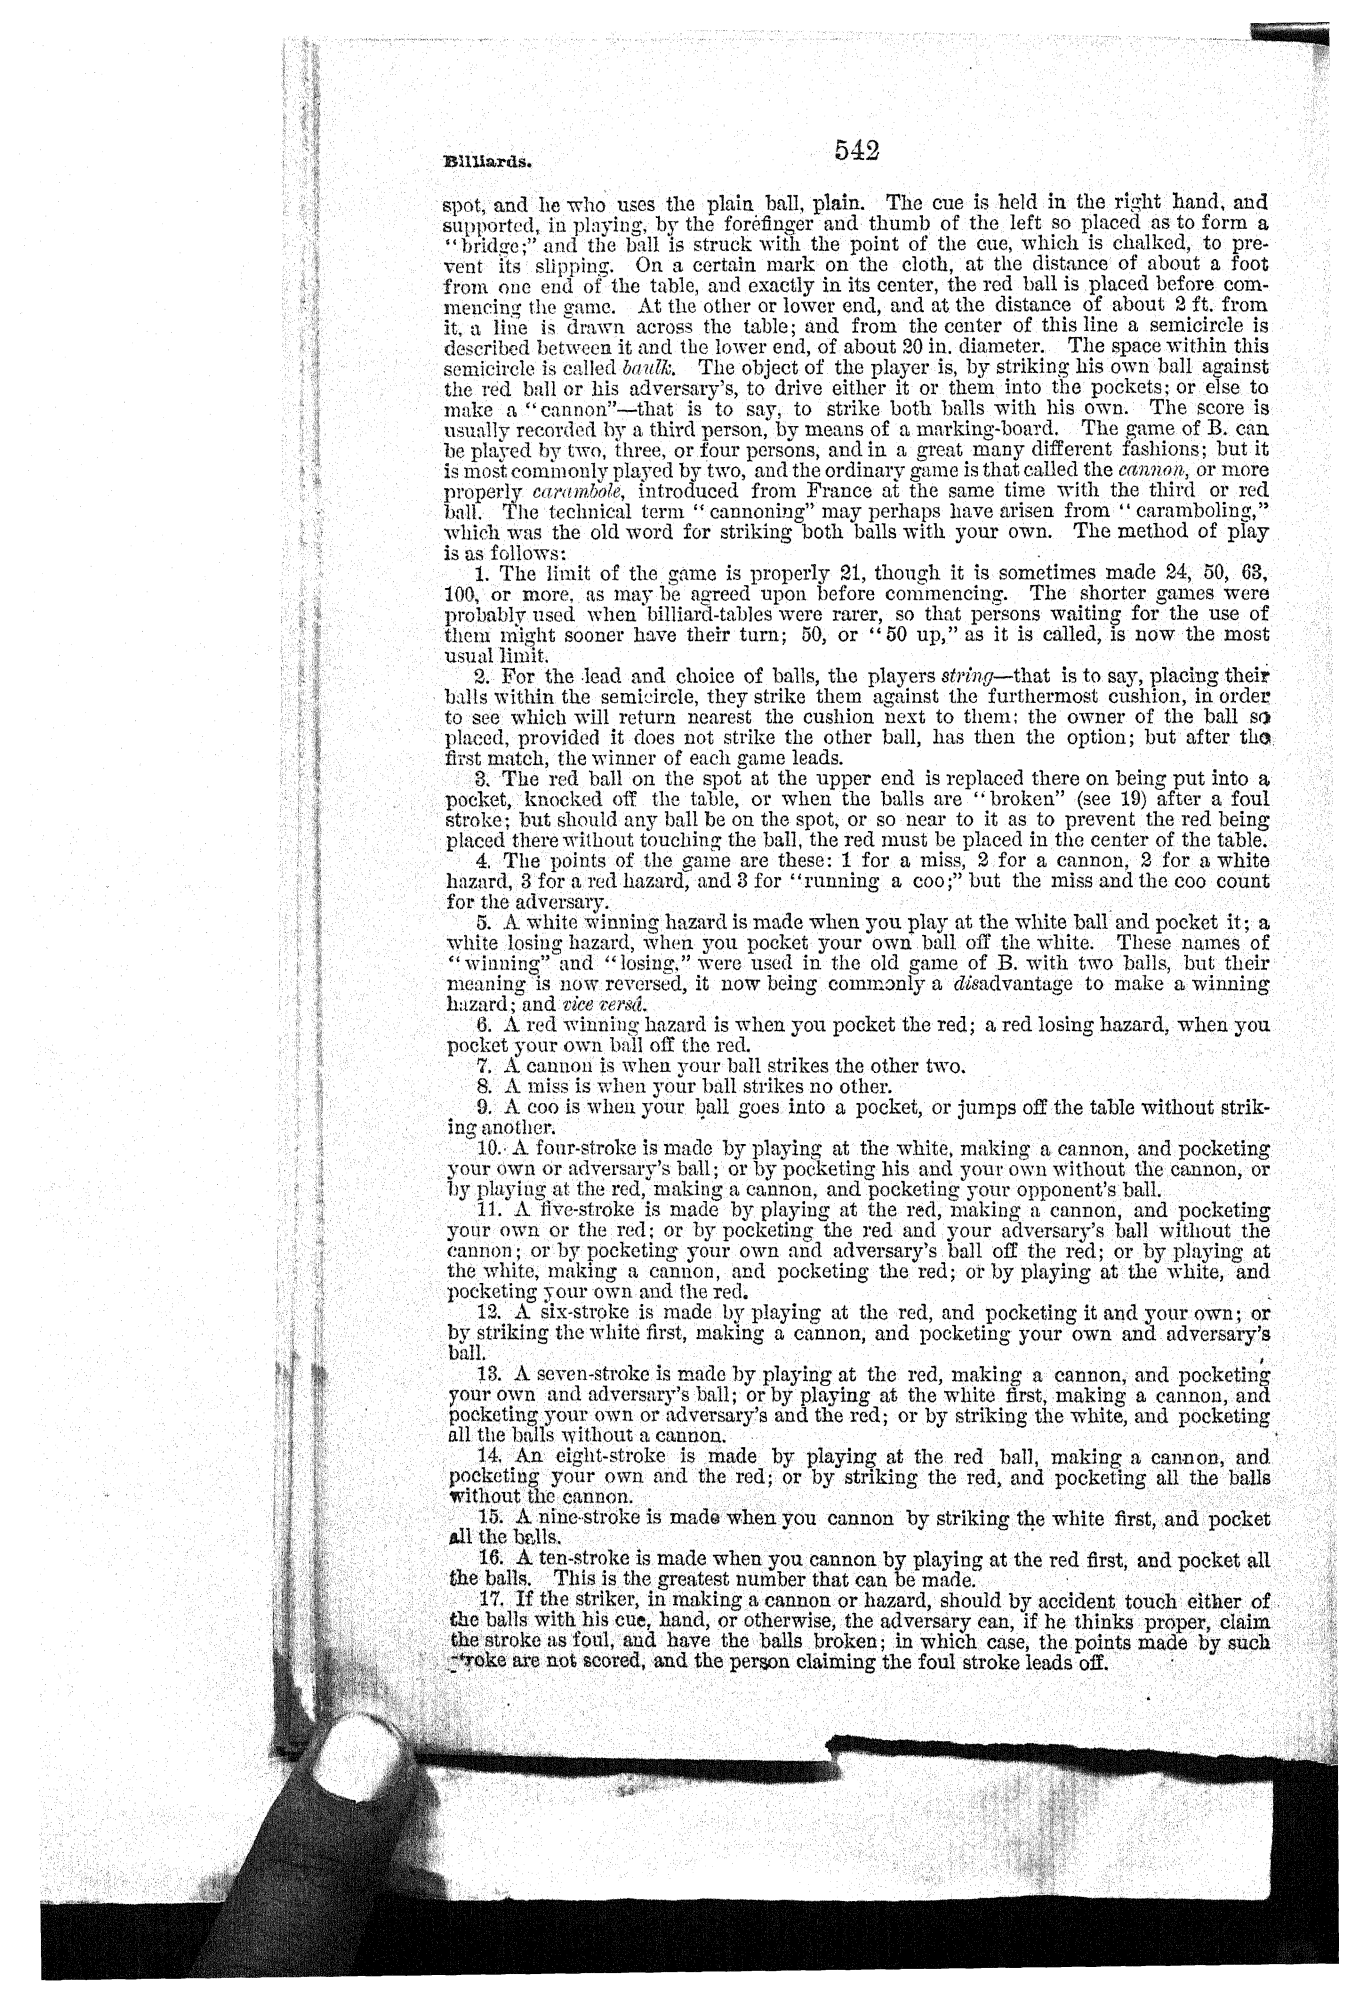
13. A seven-stroke is made by playing at the red, making a cannon, and pocketing your own and adversary's ball; or by playing at the white first, making a cannon, and pocketing your own or adversary's and the red; or by striking the white, and pocketing all the balls without a cannon.

14. An eight-stroke is made by playing at the red ball, making a cannon, and pocketing your own and the red; or by striking the red, and pocketing all the balls without the cannon.

15. A nine-stroke is made when you cannon by striking the white first, and pocket all the balls.

16. A ten-stroke is made when you cannon by playing at the red first, and pocket all the balls. This is the greatest number that can be made.

17. If the striker, in making a cannon or hazard, should by accident touch either of the balls with his cue, hand, or otherwise, the adversary can, if he thinks proper, claim the stroke as foul, and have the balls broken; in which case, the points made by such stroke are not scored, and the person claiming the foul stroke leads off.



18. Foul strokes are made as follows—namely, by the striker's ball touching either of the others; by touching any ball while rolling; by moving another ball in any way while taking aim or in the act of striking; by pushing the balls together when playing with the *butt* of the cue; by playing with both feet off the floor; by playing at a ball before it has done rolling; or by playing with the wrong ball: in this last case, should a hazard or cannon be made the adversary can have the balls broken and lead off; or should no score be made by such stroke, he can take his choice of balls and play.

19. In "breaking" the balls, you take them all off the table, place the red on the spot, and both parties play from the baulk as at commencing.

20. If the balls have been changed, and it cannot be ascertained by whom, the game must be played out with them as they then are; or even if two strokes have been made before the mistake is discovered, it must still be played out in the same way.

21. Should the striker, in making a cannon or hazard, knock his own or either of the balls off the table, he cannot score the points made by such stroke, and the opponent plays, but the balls are not broken.

22. If a ball stops on the edge of a pocket, and afterwards falls in, either through the shaking of the room, or table, or by any other accident, it must be replaced as near the original place as possible.

23. Should the striker, when in hand (i.e., when his ball is off the table), play at a ball in baulk, his adversary has the option of scoring a miss, or of having the balls replaced, and the stroke played again, or of breaking the balls.

24. If the striker's ball touch another, he must play, and should he make a cannon or hazard, the adversary can claim it as foul, or he can allow points to be scored and the person to play on; but should the striker not score, it is at the option of the opponent to break them or not.

25. Should the marker, whilst marking for the players, by accident touch either of the balls, while rolling or not, it must be put as near as possible to the place it would have otherwise occupied.

26. If the last player should alter the direction of the balls while rolling, with cue, hand, or otherwise, the striker may place it where he thinks proper.

27. A line-ball is when either the white or red is exactly on the line of the baulk, in which case it cannot be played at by a person whose ball is in hand, it being considered in baulk.

28. If the striker's ball is over the pocket, and he should, in the act of striking, miss it, but in drawing his cue back knock it into the pocket, he will lose three points, it being a coo.

29. If the red ball has been put into a pocket, it must not be placed on the spot till the other balls have done rolling, should there be a probability of either of them touching it again, as the stroke is not finished till the balls stop.

30. If the striker should touch his ball by accident when taking aim, it is not a stroke, and the ball is to be replaced; but should he touch it in the act of striking, then it is a stroke.

31. If either of the balls lodge on a cushion, it is off the table, and should a cannon or hazard be made, it does not score, and the ball must be placed on the spot, or played from the baulk, according to whether it is white or red.

32. Any person refusing to play the game out after he has played one stroke, loses it.

33. In a match of four, each person is at liberty to offer his partner advice.

34. All disputes in the game to be decided by the marker or majority of the company, but no person has a right to interfere until appealed to by one or both players.

35. It is called a love-game when no hazard has been made by the loser.

With first-class players such as Cook, Roberts, and others, the "spot stroke" is a favorite and telling one. It consists of holding the red ball (from its spot at the upper end of the table), stroke after stroke consecutively, in either of the bottom pockets. So great is the skill now displayed in this stroke, that breaks of 150 and more are frequently made. With its aid the proficient will occasionally score several hundred points before letting his adversary "in." Scores of about 700 or 800 have been achieved.

The only other game played upon a billiard-table which it seems necessary for us to notice, is that called pool. It is quite different from that above described, nor is it necessary that a good player at the one should greatly distinguish himself at the other. Pool is the game pursued at all the public billiard-rooms, and is the sole profession of many persons who might otherwise employ themselves to more advantage, if not to greater profit, since the requisites for forming a first-rate player are really high—namely, steadiness of hand and eye, imperturbable temper, and exact dynamical calculation. Pool is played by any number of persons—when between two only, it is called "single pool," and is nothing else than the old game at B. before the introduction of the red ball—and after various methods, such as playing at the last player, playing at the nearest ball, and playing at any ball whatever. The most common is that of playing at the last player, the rules of which game are to be found, by those whom they concern, upon the walls of every room where it is played. The best billiard-tables, furnished with slate bed and India-rubber cushions, cost from £70 to £80, and upwards.

BILL, or BILL OF COMPLAINT, **IN CHANCERY**, was a formal statement in writing or pleading, by which a plaintiff in the court of chancery asked its equitable redress or

relief. It was in the style of a petition addressed to the lord chancellor, lord keeper, or lords commissioners for the custody of the great seal, unless the seals were at the time in the queen's hands, or the chancellor himself were the suitor, in which case the bill addressed the queen herself; for, according to the theory of the court of chancery, it was the conscience of the sovereign that was there addressed. The crown itself, however, was also the suitor, either on behalf of its own prerogatives, or of those rights which are under its particular protection, such as the objects of a public charity; and then the matter of complaint was laid before the court, not by way of bill or petition, but of *information*. But since 1874 all suits begin by writ.

In stating the plaintiff's case, the bill was formerly exceedingly prolix and tedious, but now the statement of claim of plaintiff contains merely a full and distinct account of the case, the material facts and circumstances relied on; and it should ask specifically for the particular relief which the plaintiff conceives himself entitled to, and also for general relief, or, as the bill once usually stated, "for such further and other relief as the court may think proper;" the object and advantage of which general prayer was, to decree equity and justice without regard to the particular equity sought for. It is unnecessary that the claim be signed by counsel, in order to guard against irrelevant and improper matter. It is indeed in nearly all cases drawn by counsel, from instructions laid before him by the plaintiff's solicitor.

Where the object is the administration of the estate of a deceased person, the procedure is by *summons*, and is of a simple and very summary nature. In cases of this description, without either formal pleading or any direct application to the court itself, a summons may at once be obtained, and the estate thereupon put in a course of administration. There are also cases where the chancellor's aid is sought for in the form of a *petition*.

Generally speaking, the modern English claim in chancery very much resembles the Scotch summons and condescendence. See on the subjects of this article, CHANCERY; CHANCELLOR, LORD; PLEADING; SUMMONS; CONDESCENDENCE.

BILL IN CRIMINAL CASES is the formal name of an indictment for a crime or misdemeanor, when preferred before a grand jury. If that body finds "a true bill," the prisoner or party accused is thereupon tried before a petty jury, whose verdict determines his guilt or his innocence; but if the grand jury "ignore the bill," the accused is at once set at liberty. In the latter event, however, other bills may be sent up against him, with or without the same result. See ARRAIGNMENT, GRAND JURY, INDICTMENT, PROSECUTION, TRIAL.

BILLINGS, JOSEPH, an English navigator with capt. Cook in his last voyage. In 1785, he went into Russian service, and explored the region around Kolyma river in e. Siberia, near the winter quarters of Nordenskjold, in 1878–79. In 1789–90, he made several voyages in the Okhotsk sea and the Arctic ocean, exploring the islands near the coast of Alaska. He returned to Kamchatka in 1791.

BILLINGS, JOSH. See SHAW, HENRY W.

BILLINGS, WILLIAM, 1746–1800; an American composer who gave up the trade of a tanner to teach psalm-singing, and published six books of tunes, nearly all of which were of his own composition. So far as known, he was the first American composer of music, and his music, which now seems so quaint, was at one time universally popular.

BILLINGSGATE, a gate, wharf, and fish-market, a little below London bridge, to the w. of the custom-house. It was opened in 1558 as a landing-place for provisions; and in 1699 was made "a free and open market for all sorts of fish." It is the only wholesale fishmarket in London; and fish of every kind, fresh or cured, is admitted free of duty, if taken by British subjects and imported in British vessels. Lobsters and turbot, also, are admitted free, though in foreign vessels. All fish are sold by tale, except salmon and eels, which are sold by weight; and oysters and other small shell-fish, which are sold by measure. The influx of salmon about the beginning of autumn is sometimes about 1000 boxes per day. The market opens daily at 5 A.M.; no fish is sold on Sunday, except mackerel. The fishermen consign their cargoes to the dealers, or "salesmen," who occupy stalls in the market; and these supply the retail-dealers. An officer called the clerk has the general superintendence of the market, and the quality of all fish offered for sale is tested by inspectors. The unpolished phraseology native, though not peculiar, to this quarter of London, has given rise to the proverbial use of the name.

BILLINGTON, ELIZABETH, the most celebrated English female singer of her day, was the daughter of a German musician named Weichsel, and b. in London, 1769. She early came forward as a performer on the piano and as a composer; and having married her music-master, Thomas B., appeared with brilliant success on the opera stage in Dublin in 1786. Returning to London, she was engaged at Covent Garden at the then unheard-of salary of £1000 for the season. She perfected her musical education under Sacchini in Paris, who wrote for her his opera, *Inez de Castro*, while she was singing in Naples, 1794. She appeared subsequently in Venice and Rome with the greatest applause. In 1799, her first husband being dead, not without suspicion of poison, she married a Frenchman of the name of Florissant, and returned to London, 1801, where she received £4000 for six months, playing alternately at Covent Garden

and Drury Lane. She retired from the stage in 1809, and died (1818) at her villa, near Venice. Her character as a wife was the reverse of exemplary; but as a singer she was unrivaled. To a voice of the largest compass and richest tone, trained in all the art of the Italian school, she added a fascinating personal beauty and grace. In illustration of her spirit, it is told that Catharine II. proposing, through her London ambassador, to engage Mrs. B. for the theater of St. Petersburg, the vocalist demanded a sum that seemed to the ambassador exorbitant. "The empress of all the Russias does not give more to her ministers." "Then let her make her ministers sing," was the reply.

BILL IN PARLIAMENT. See ACT OF PARLIAMENT and PARLIAMENT.

BILLITON, an island in the Dutch East Indies, between the s.e. of Banca and the s.w. of Borneo. It is separated from the former by Clement's strait, and from the latter by the Caremeta or B. passage. Its n.w. point is in lat. 3° 13′ s., and long. 108° 7′ east. It is said to contain 2500 sq.m. and 20,000 inhabitants. It is rich in iron and timber, and imports rice, trepang, edible birds-nests, seaweed, tortoise-shell, and wax. Its coasts are beset with rocks and islets.

BILL OF ADVENTURE is a writing by a merchant, stating that goods shipped by him, and in his name, are the property of another, whose *adventure* or chance the transaction is—the shipping merchant, on the other hand, undertaking to account to the adventurer for the produce. Generally, in commercial law, an adventure may be said to be a speculation in goods shipped under the care of a *supercargo*, to be disposed of by him to the best advantage, for the benefit of his employers.

BILL OF ATTAINDER, and BILL OF PAINS AND PENALTIES, are bills in parliament, introduced for penally enacting the attaint and punishment of persons who have criminally offended against the state and public peace. Such a legislative proceeding was had recourse to generally in times of turbulence, when, either from the peculiar nature of the offense, or in consequence of difficulties in the application of the ordinary laws, it became necessary to resort to parliament. During the reign of Henry VIII., persons of the highest rank were frequently brought to the scaffold by such means; among whom may be mentioned the earl of Surrey, the earl of Essex, and others, who suffered for denying the king's supremacy; and during other reigns, both before and after that of Henry VIII., these bills were more or less had recourse to. There were greater facilities for conviction by this penal legislation than by the ordinary judicial procedure at law; because, while in the latter the strict rules of legal evidence must have been observed, the inquiry under a bill of attainder, or of pains and penalties, was entirely in the hand of parliament, who might dispense at their pleasure with such rules and forms of law as appeared inconvenient or unsuitable to the purpose in hand. Accordingly, in most of the cases to which we have referred, the bills were passed upon evidence which could never have been received as sufficient or even admissible in a court of law; and there are even instances where parties were attainted, and punished, without there being any evidence against them at all, and even without their being heard in their defense. Under the Stuarts, the extraordinary mode of proceeding in parliament was seldom had recourse to in England, and it has been still seldomer used since the accession of the house of Hanover. The Jacobite movement in Scotland, after the union with that country, was productive of several instances of parliamentary attainder, which, however, resulted merely in the forfeiture of the estates of the attainted parties, and these attainders were likewise unattended with the harsh, and in too many instances, capital consequences, which were formerly the inevitable results of treason so discovered. In regard to bills of pains and penalties, perhaps the two most remarkable instances are those of bishop Atterbury, in 1722 (see ATTERBURY), and of queen Caroline, wife of George IV., in 1820.

The proceedings of parliament in passing bills of attainder, and of pains and penalties, do not vary from those adopted in regard to other bills. But the parties who are subjected to these proceedings are admitted to defend themselves by counsel and witnesses before both houses. In the best of times, this summary power of parliament to punish criminals by statute, should be regarded with jealousy; but whenever a fitting occasion arises for its exercise, it is undoubtedly the highest form of parliamentary judicature. In impeachments, the commons are but accusers and advocates; while the lords alone are judges of the crime. On the other hand, in passing bills of attainder, the commons commit themselves by no accusation, nor are their powers directed against the offender; but they are judges of equal jurisdiction, and with the same responsibilities as the lords; and the accused can only be condemned by the unanimous judgment of the crown, the lords, and the commons.—May's *Proceedings of Parliament*, 3d edition, p. 509. In passing bills of attainder, the bishops, contrary to the practice in capital impeachments, take part in the proceedings, and vote.

In such parliamentary attainders, the bill sets out, by way of preamble, the facts and evidence on which it is founded, and concludes, by way of enactment, that the accused "is hereby convicted and attainted of high treason, and shall suffer the pains of death, and incur all forfeitures as a person attainted of high treason." In the case of pains and penalties, again, the preamble generally assumes the facts as proved, and proceeds to enact the pains and penalties; that is, the deprivations, indignities, and other punishment awarded. See ATTAINDER, PAINS AND PENALTIES. BILL IN PARLIAMENT.

BILL OF ATTAINDER (*ante*). The constitution of the United States expressly declares (art. i., sec. 9) that "no bill of attainder or *ex-post-facto* law shall be passed."

BILL OF COMPLAINT IN CHANCERY (*ante*), is the same as a declaration in an action at law, a libel in admiralty courts, or (in England) an allegation in a spiritual court. It is a complaint in writing addressed to the chancellor, giving the names of the parties to the suit, a statement of the matters on which the complainant relies, the allegations which he makes, the assertions that the matters complained of are contrary to equity, and a prayer for relief. Ordinarily, such a bill consists of nine parts: 1, the address; 2, the names of the parties; 3, statements of the plaintiff's case; 4, a general charge of confederacy; 5, the allegations of the defendant's pretenses; 6, the clause of the jurisdiction; 7, a prayer that the defendant may answer; 8, a prayer for relief; 9, a prayer for process. In recent practice the "confederacy" and the reference to the defendant's probable answer, and also the jurisdiction clause, are omitted, except where confederacy and fraud are specifically charged.

BILL OF COSTS is an account stating articulately and in detail the charges and disbursements of an attorney or solicitor in the conduct of his client's business; and which costs may be recovered under the regulations of the attorneys' and solicitors' act, 6 and 7 Vict. c. 73. See COSTS.

BILL OF COSTS (*ante*), the statement of items that make up the full amount of costs in a suit. It is assessed by the proper court officer, and the tax may be demanded before the payment of the main bill.

BILL OF CREDIT, a paper issued and circulated as money by a government. Though the federal constitution denies to the states the power to issue such bills of credit, it is indirectly done in banking when the bills of a bank authorized by a state are issued as money.

BILL OF EXCEPTIONS is a statement of objections, by way of appeal, against the ruling or charge of a judge in a civil cause. See TRIAL.

BILL OF EXCEPTIONS (*ante*), a written statement of objection to a decision of a court on a point of law, made by either party in a case, and certified by the judge making the decision excepted to. The object of a bill of exceptions is to bring the points complained of before the proper court for review and possible reversal of the decision.

BILL OF EXCHANGE, a document purporting to be an instrument of pecuniary obligation for value received, and which is employed for the purpose of settling a debt in a manner convenient to the parties concerned. The original and simple idea of a bill is this: Two parties residing at a distance from each other can settle their transactions without the trouble or risk of sending money direct from the debtor to the creditor. Thus, A and B are two parties in business in London; and C and D are merchants in Cadiz. A owes C £1000; and D owes B a like sum. Instead of A sending cash to C, and D to B, A pays B and receives B's bill on D, which he sends to C, who receives the amount from D; so that the transaction throughout is settled, without a farthing in money being sent from Cadiz to London, or from London to Cadiz. Another simple idea of a bill is this: One person owes another £100 for goods, for which he is to have credit for three months. The creditor, however, not being able conveniently to be without the money for that length of time, gets from the debtor an obligation or bill bearing that the £100 is to be paid in three months. This bill, being a negotiable instrument, will be discounted by a banker, or other capitalist, who now stands in the position of the creditor, and receives payment when the bill is due. Thus, a bill of exchange performs two kinds of offices in commerce—it saves the transmission of coined money, and it enables creditors not only to fix down debtors to a day of payment, but to get the use of a sum equivalent to the debt (less a small discount) before it is properly due.

The origin of this important mercantile instrument is attributed by Montesquieu and others to the Jews and Lombards, when banished from France and England in the 13th c., for their usury and other alleged vices, in order the more easily to recover the effects they had left behind in these countries; but Blackstone shows its earlier use in the Mogul empire in China; and Depauw, in his *Philosophical Researches respecting the Greeks*, has attempted to prove that bills of exchange were in use among that people, and particularly among the Athenians. However this may be, it is certain that hitherto no trace of them has been discovered either in the Roman code, or in any other system of ancient jurisprudence. The first notice of them in modern times occurs about the middle of the 12th c., and by the end of the 14th they had got into general use in all the commercial states of Europe. In England, from about the middle of the 14th c. down to the time of James I., and for many years after, bills of exchange were restricted to the purposes of foreign commerce. What are called inland bills—that is, bills drawn by and upon persons resident in this country—were not employed much earlier than the reign of Charles II., and even then they were regarded with distrust and jealousy by the English judges. Another restriction upon bills of exchange was, that the privilege of their use was confined to parties that were merchants; and there is an old case tried by the court of king's bench, in the days of William and Mary, where it was decided that an action on a foreign bill of exchange could not be maintained, because the defendant was a *gentle-*

man, and not a merchant! But all restraints on such instruments gradually yielded to the wants and conveniences of society, and now any one capable of making a contract can be a party to a bill transaction, without regard to position, calling, or occupation. In Scotland, inland bills were put on the same footing with foreign bills, by an act of the Scottish parliament passed in 1696.

A bill of exchange, as distinguished from a *promissory-note* (q.v.), is defined in law-books to be a written and open letter of request, addressed by a person who is called the drawer, to another person called the drawee, desiring him to pay a certain sum of money, either to the drawer himself or to a third party called the payee, within a certain time after its date, or after it is presented for payment, or on demand. If the drawee signs the bill in token of his agreeing to this request, he is called the *acceptor*. For the constitution of the bill itself, no particular form of words is necessary, provided its characteristic qualities clearly appear on the face of it, as an essentially pecuniary instrument; a bill of exchange is only good for a certain sum in money: such an instrument for the delivery of *goods* or property other than money, would be invalid. But although no particular words are required in a bill or note, it is always advisable to adhere, as much as possible, to their customary form. To this general rule, however, there are exceptions: thus, by the 48 Geo. III. c. 88, negotiable bills or notes for less than 20*s*. are void; and by the 17 Geo. III. c. 30, s. 1—made perpetual by the 27 Geo. III. c. 16, and 7 Geo. IV. c. 6—such bills and notes under 20*s*. are illegal, and above this amount and less than £5, are also void unless they specify the name and place of abode of the person to whom or to whose order they are made payable, and are attested by one subscribed witness at the least, and bear date at or before the time when they are issued, and are made payable within 21 days after the date, and are in the form prescribed by the act. There are also certain forms prescribed with respect to checks, and with respect to bills and notes issued and reissuable by bankers at certain distances.

In regard to foreign bills, the risk of miscarriage to which they are liable in their transmission to distant countries has given rise to the custom of drawing them *in sets;* that is, writing out two or three of the same form and tenor, and transmitting them to the payee by different channels, so that if one or two of the individuals of any set are lost, the other might reach its destination. The first of the set that is presented and accepted is alone entitled to payment, and payment of it discharges the acceptor; but foreign bills of course, may also be drawn singly.

Besides the other requisites mentioned, bills of exchange must be duly *stamped*. The regulations on this subject are contained in the 17 and 18 Vict. c. 83, and are to be found in almanacs and other publications in common use. By sections 3 and 5 of the act, it is provided that the duties on bills drawn out of the United Kingdom shall be denoted by adhesive stamps, to be affixed by the holder of the bill before negotiating it, under penalty of £50.

The following are the usual forms of the bills of exchange:

FORM OF A FOREIGN BILL.

£1000. JAMAICA, 1*st Jan.*, 1878.

Fifty days after sight of this first of exchange (second and third unpaid) pay to the order of A. B. one thousand pounds sterling, value received.

To E. F., London. C. D.

FORM OF AN INLAND BILL.

£100. LONDON, 1*st Jan.*, 1878.

(Stamp.) Two months after date [or "at sight," or "on demand," or "at —— days after sight"], pay to Mr. ——, or order, one hundred pounds, for value received.

To MR. ——, merchant, Bristol, payable at ——. C. D.

FORM OF A BILL ABOVE ONE AND UNDER FIVE POUNDS.

As prescribed by stat. 17 Geo. III. c. 30. [Insert the place, day, month, and year, when and where made.]

Twenty-one days after date, pay to A. B. of ——, or his order, the sum of ——, value received.

To E. F. of ——. *Witness*, G. H. E. D.

From the first form it will be seen that there are usually three parties to a bill of exchange, these three being: 1st, The *drawer* (C. D.); 2d, The *payee*, or party in whose favor the bill is drawn, and who is entitled to receive the contents (A. B.); and 3d, The *acceptor* or *drawee* (E. F.). The transaction, however, may be simply between the drawer and acceptor, without the interposition of a third party; and there are other modifications and changes of form, according to the circumstances of the case, and the mode in which it is desired to have the bill negotiated. The bill being thus in proper form, and duly authenticated, is then presented for acceptance, which may be defined to be the act by which the drawee evinces his consent to comply with, and be bound by, the request contained in the bill of exchange directed to him; or, in other words, it is an engagement to pay in money the bill when due. While the bill is in the possession of A. B. he is the holder, but if he pass it to G. H., A. B. is the indorser and G. H. the indorsee or ultimate holder. Acceptance in the case both of inland and foreign bills of exchange

must now be in writing on the bill, and signed by the acceptor, or some person duly authorized by him. In England, the mode of acceptance is by the acceptor simply signing his name across the bill, or with the word "accepted" before his name; but in Scotland acceptance is usually made by the acceptor signing his name immediately under the drawer. There are certain precautions to be observed before accepting. The drawee should, upon presentment for acceptance, and before he accepts, assure himself that the signature of the drawer is genuine, and that there has not been a fraudulent substitution of a larger sum than that originally inserted in the bill by the drawer. And if the drawee accept a forged bill, or a bill for a larger amount than that originally named by the drawer, he will nevertheless be liable to pay a *bona-fide* holder; nor will he have any right to recover against the drawer for the larger amount. There is also acceptance *supra protest*, which takes place where, after a foreign bill has been protested for non-acceptance, but not before, the drawee or any other person may accept it *supra protest*, which acceptance is so called from the manner in which it is made. And where the drawee of a foreign bill cannot be found, or is not capable of making a contract, or refuses to accept, this description of acceptance is frequently made in order to save the credit of all or some of the parties to the bill, and prevent legal proceedings. In this country it is called an acceptance for the honor of the person or persons for whose use it is made, and in France an acceptance *par intervention*. It had been a question in England what amounted to a qualified acceptance, but that was set at rest by the 1 and 2 Geo. IV. c. 78 for England, and 9 Geo. IV. c. 24 for Ireland, which required an acceptance, in order to be a qualified acceptance, to express that the bill is "payable at a banker's house or other place only, and not otherwise or elsewhere." And now, as against the acceptor, the absence of these words from the acceptance leaves it at large, an unqualified acceptance, not requiring presentment at a particular place, notwithstanding that, in the body of the instrument, a particular place of payment is expressly specified by the drawer. There may likewise be conditional acceptance—that is, acceptance in such a form as will subject the acceptor to payment of the bill on a contingency only, of which there are numerous examples in the law reports; for instance, to pay "as remitted for," or on account of the ship *Thetis*, when in cash, for the said "vessel's cargo," or on condition of getting a certain house by a given term, or when certain goods are sold, or when certain funds come to hand.

The bill as a negotiable instrument being thus complete in all its parts, may either be held by the drawer or other payee till due, when it may be presented for payment to the acceptor, or it may at once be transferred by *indorsement* (q.v.), the indorsee taking it for its value at maturity, and in the mean time cashing or discounting it to the holder. There may be a succession of indorsees, the last of whom is entitled to payment; and to him all the other indorsees, as well as the drawee and drawer, are bound.

When the bill comes to maturity—that is, when the period arrives for its presentment—it must either be at once paid, or the parties must arrange for its *renewal* (q.v.). If the latter course is not agreed on, and the necessary funds are not forthcoming, the holder can only then proceed to recover at law; and this is now done in a very speedy form under a recent act, the 18 and 19 Vict. c. 67. This act, however, does not extend to Ireland, where the old form of action still prevails. But in Scotland payment of bills may be enforced even more summarily without any action, under the severe provisions of two old Scotch acts passed in 1681 and 1696. See INDORSEMENT, PROMISSORY-NOTE, RENEWAL. Bills are sometimes drawn "at sight," "on demand," or at "one day's date;" and in these cases it is doubtful whether the three days of grace allowed for payment beyond the literal time specified in the document are applicable. Unless in special cases, bills, by the statute of limitations (see LIMITATION) in England, and by prescription (q.v.) in Scotland, do not cease to be valid documents for six years.

In the United States there has sprung up a method of dealing with bills of exchange which is not much known in England. This consists in selling bills without a concurrent obligation by indorsement to make them good. Instead of discounting his bills in the usual form through a banker, a merchant in New York will sell his bills to a broker or dealer in this kind of instrument, the price paid being according to the state of the money-market and the creditworthiness of the acceptor. In such cases, the purchaser stands in the place of the drawer, undertakes all risks, and as custodier of the bill, has the power of legally exacting payment. This method of transacting with bills is called discounting *without recourse*.

ACCOMMODATION BILL. A bill in its legitimate sense is a document constituting a debt, and as such is beneficial to all parties connected with its negotiation. A owes B £100. A cannot conveniently pay the amount, while B is in need of it; B draws on A, and C (a banker) discounts, i.e., for a consideration pays the amount to B. B thus gets the money at once, A obtains time, while C makes a profit for advancing. These facilities have had the effect of inducing bills to be resorted to for raising money where no value is given, and in which one party gives the use of his name for the *accommodation* of another. In the above case, for example, let us suppose that A does not owe B, but yet accepts B's draft. If C discounts the bill, it is immaterial whether he knows that A has got value or not—as an onerous holder, he can compel payment from A if B cannot pay the bill. But if merely in B's hands, the amount is not recoverable from A if the latter can prove that no value was received by him. Accommodation bills give rise to

much fraud and rash speculation, and many attempts have been made to suppress the system; but it is difficult to do so without unduly interfering with the negotiation of *bona-fide* bills.

BILL OF EXCHANGE (*ante*). In this country an inland bill of exchange is one of which the drawer and drawee live in the same state; if the drawee lives in another state or country, it is called foreign. A bill of exchange is negotiable, and may pass through any number of hands before payment. The transfer may be by indorsement either "in blank" or "in full;" the first method requires only the name of the payee upon the back, in which case the bill passes from hand to hand as payable to bearer; in the second method a person is named to whom payment is to be made, whose indorsement then becomes necessary to a further transfer. When so indorsed as to be made payable to bearer, it becomes, like money, the property of whomsoever receives it in good faith and for a consideration, even from a thief. If the drawee, upon presentation, refuses to pay, the indorser becomes liable to the holder. If the last indorser is compelled to pay in full, he may in turn recover in full from either of the preceding indorsers. The holder, however, is not required to pursue any prescribed order as between the indorsers, but may bring suit against whichever of them he prefers; and the one thus selected has the same right of action against any preceding indorser. Where a bill is made payable by successive indorsements to several payees, they are liable jointly, and only for their respective shares.

In law, every indorsement is held to be a contract, so that, though the original bill should be void, the indorser will yet be responsible. If the payee assents to a conditional acceptance of an unconditional bill, he is bound thereby; but he is not obliged to take such an acceptance. If the drawee refuses to pay, "protest" is usually made, as in case of the non-payment of a promissory note due to a bank. Notice to the drawer and indorsers must be promptly given in this or some other form. Bills of exchange are made payable either "at sight," or in a certain number of days "after sight." The drawee is entitled to "three days' grace" before payment. If the holder, for a consideration, agrees with the drawee to extend the time of payment, the drawer and indorsers are discharged unless they give their assent to such agreement.

BILL OF HEALTH, a certificate or instrument, signed by consuls or other proper authorities, delivered to the masters of ships at the time of their clearing out from all ports or places suspected of being particularly subject to infectious disorders, certifying the state of health at the time that such ship sailed. A *clean* bill imports that at the time the ship sailed no infectious disorder was known to exist. A *suspected* bill, commonly called a *touched* patent or bill, imports that there were rumors of an infectious disorder, but it had not actually appeared. A *foul* bill, or the absence of a clean bill, imports that the place was infected when the vessel sailed. See M'Cullough's *Commercial Dictionary*.

BILL OF INDEMNITY, an act of parliament, passed every session, for the relief of those who have unwittingly or unavoidably neglected to take the necessary oaths, etc., required for the purpose of qualifying them to hold their respective offices. See ACT OF INDEMNITY, and ABJURATION.

BILL OF INDICTMENT, a written accusation, charging a person or persons with crime or misdemeanor, presented by a grand jury, usually through the district attorney. If the jury believe that the person ought to be tried they "find," or return, "a true bill;" if the evidence does not warrant a trial, the return is, "not a true bill," or "not found."

BILL OF LADING is a receipt from the captain of the vessel to the shipper (usually termed the *consignor*), undertaking to deliver the goods—on payment of freight—to some person whose name is therein expressed, or indorsed thereon by the consignor; and the delivery of this instrument—independently of the actual delivery of the goods—will suffice to pass and transfer to the party so named (usually termed the *consignee*), or to any other person whose name he may think fit to indorse thereon, the property in such goods; and by a recent statute, 18 and 19 Vict. c. 111, it is now expressly provided that every consignee and every indorsee of a B. of L. shall also have transferred to him all rights of suit, and be subject to the same liabilities in respect of the goods as if the contract in the B. of L. had been made with himself. It is also provided that every B. of L. shall be conclusive evidence of the shipment made. The act, however, declares that nothing contained in it shall prejudice or affect any right *in transitu*, or any right to claim freight against the original shipper or owner, or any liability of the consignee or indorsee, by reason or in consequence of his being such consignee or indorsee, or of his receipt of the goods, by reason or in consequence of such consignment or indorsement. See STOPPAGE IN TRANSITU.

BILL OF LADING (*ante*), formerly a careful contract for the transportation of wares by water, and confined almost entirely to shipping; but latterly applied to any sort of transportation, so that even the slightest memorandum given by a common carrier may be a bill of lading.

BILL OF PARTICULARS, an informal statement of a plaintiff's cause of action or of a defendant's set-off, containing the items of a claim and showing how they arose.

defendant, in giving notice or pleading set-off, must give a bill of particulars, or he will be precluded from giving evidence in support of it at the trial.

BILL OF PRIVILEGE. In England, the form of proceeding against an attorney of the court, who is not subject to arrest.

BILL OF RIGHTS (*ante*). The federal constitution makes no special declaration of personal rights, but nearly all the state constitutions supply the omission, some of them at great length. The bill of rights is merely a statement of those national and political immunities that all men enjoy and share in common.

BILL OF RIGHTS. See RIGHTS.

BILL OF SALE is a writing under seal, evidencing a grant or assignment of chattels personal. The occasions to which these instruments are commonly made applicable are sales of fixtures and furniture in a house; of the stock of a shop, of the good-will of a business, of an office, or the like. But their most important use is in the transfer of property in ships, which, being held in shares, cannot, in general, be delivered over on each change of part ownership. Such bill of sale may be either absolute or conditional: in the former case, operating as a conveyance, and in the latter, as a security. By the 17 and 18 Vict. c. 36, passed to prevent frauds upon creditors by secret bills of sale, it is provided that every bill of sale must be filed in the court of queen's bench within 21 days after its execution, together with an affidavit of the time of such bill of sale being given, and a description of the residence and occupation of the deponent, and of every attesting witness of such bill of sale, otherwise it will be void, as against assignees in bankruptcy and insolvency, and creditors. The residence and occupation of each attesting witness should appear in the bill of sale, and also in the affidavit.

Notwithstanding these precautions, the practice of disposing of various kinds of movable property, more particularly household furniture and stocks of goods in trade by bill of sale, leads to great and injurious deceptions; for as the seller, by an arrangement with the buyer, sometimes retains possession, and is in the eye of the world as much the proprietor as ever, he is enabled to carry on his affairs, and get credit as usual. See REPUTED OWNERSHIP.

BILL OF SIGHT. The law on this subject is regulated by the customs regulation act, 3 and 4 Will. IV. c. 52, s. 24 and 25, and is to the effect that when a merchant is ignorant of the real quantities or qualities of any goods assigned to him, so that he is unable to make a perfect entry of them, he must acquaint the collector or comptroller of the circumstance; and the collector is authorized, upon the importer or his agent making oath that he cannot, for want of full information, make a perfect entry, to receive an entry by bill of sight for the packages, by the best description which can be given, and to grant warrant that the same may be landed and examined by the importer, in presence of the officers; and within three days after any goods shall have been so landed, the importer shall make a perfect entry, and shall either pay down the duties, or shall duly warehouse the same. In default of perfect entry within three days, such goods are to be taken to the queen's warehouse; and if the importer shall not within one month make perfect entry, and pay the duties thereon, or on such parts as can be entered for home use, together with charges of moving and warehouse rents, such goods shall be sold for payment of the duties.

BILL OF STORE, a license under the customs regulation act, the 3 and 4 Will. IV. c. 52, granted by the custom-house to merchants to carry such stores and provisions as are necessary for a voyage, custom-free.

BILL OF VICTUALING, or VICTUALING BILL, is a document relating to the stores put on board a ship when leaving a British port; it is a safeguard in reference to customs duties, and is regulated by a clause in an act passed in 1853. The master of a ship, on leaving a British port, for a voyage which (out and home) will not occupy less than 40 days, receives from the customs authorities an order or permission for the shipment of such stores and victuals as may be required—the data being the number of crew and passengers, and the probable duration of the voyage. When these are shipped, the master prepares a correct account of them, and of any other stores at that time in the vessel, and this account, when approved and countersigned by the customs officers, constitutes the victualing bill. No stores are allowed to be taken on board the ship, nor any articles taken on board to be deemed as stores, unless they be specified in this document.

BILLOM, a t. of France, in the department of Puy-de-Dôme, situated on a hill 14 m. e.s.e. of Clermont. It is one of the most ancient towns of Auvergne, and was formerly surrounded by walls, which have now disappeared; its commerce and manufactures have also declined. So early as 1455, a university was founded at Billom, which a century later passed into the hands of the Jesuits, and was governed by them until the suppression of their order. Pop. '76, 3,737, chiefly engaged in the manufacture of earthenware.

BILLON (see BULLION) is an alloy of copper and silver, in which the copper predominates, and which is used in some countries for the smaller denominations of money. The *groschen* of North Germany—e. g., corresponds nearly to an English penny—is of

B., and is about the size of an English fourpenny silver-piece. The object is to avoid the bulkiness of copper coin; but B., besides affording facilities for counterfeits, is dirty and inelegant.

BILLS OF MORTALITY are accounts of the births and deaths within a certain district; and they were an expedient, with the view of communicating to the inhabitants of London, to the court, and to the constituted authorities of the city, accurate information respecting the increase or decrease in the number of deaths. These bills were commenced in 1592, during a time when the plague was busy with its ravages; but they were not continued uninterruptedly until the occurrence of another plague in 1603, from which period, up to the present time, they have been continued from week to week, excepting during the great fire, when the deaths of two or three weeks were given in one bill. In 1605, the parishes comprised within the B. of M. included the 97 parishes within the walls, 16 parishes without the walls, and 6 contiguous out-parishes in Middlesex and Surrey. In 1662, the city of Westminster was included in the bills; in 1636, the parishes of Islington, Lambeth, Stepney, Newington, Hackney, and Redriff. Other additions were made from time to time. At present, the weekly B. of M. include the 97 parishes within the walls, 17 parishes without the walls, 24 out-parishes in Middlesex and Surrey, including the district churches, and 10 parishes in the city and liberties of Westminster. The parishes of Marylebone and St. Pancras, with some others, which, at the beginning of last century, had only 9150 inhabitants, but now contain a rapidly increasing population, were never included in the bills.

But these bills are now, from want of proper machinery, of little or no value, and the only true bill is now that prepared at the register-general's office, under the new registration act. The first of these weekly bills was commenced Jan. 11, 1840, and the series has been continued from that time without interruption. See Wharton's *Law Dictionary*, 2d edition, 1860, and Knight's *London*.

BILL, TRUE. See BILL OF INDICTMENT.

BILMA, a t. of the Sahara, Central Africa, situated in lat. 18° 40′ n., long. 14° e., on an oasis called the Wady Kawas, on the route between Murzuk and lake Tsad. It is the capital of the Tibu country, and important as a resting-place of caravans crossing the desert. Dates grow abundantly here; and large quantities of salt are collected from lakes in the vicinity for export to Bornu and Sudan.

BILSA, or BHILSA, a t. of India, in Malwa, in the territory of Gwalior, Scindia's dominions, on the right bank of the Betwa, 188 m. s. from Gwalior, and 32 m. n.e. from Bhopal. It is situated on an elevated mass of trap rock, and has a fort inclosed by a stone wall, and furnished with square towers and a ditch. Outside the walls are some spacious streets, and many good houses. B. was taken from the Hindus by Samsuddin Altamsh, sovereign of Delhi, in 1230; and after several times changing hands between Hindu and Mussulman masters, was finally incorporated with the empire of Delhi by Akbar, in 1570. The population is about 30,000. B. and the pergunnah of which it is the capital, are said to yield a revenue of 325,000 rupees. The finest tobacco produced in India is from a small piece of land, about three acres, near Bilsa. Its superiority is said to be entirely owing to careful cultivation. There is at B. a brass cannon, of beautiful workmanship, said to have been made by order of Jehangir, 19½ ft. in length, with a bore of 10 in.

BILSON, THOMAS, 1536–1616; an English author, bishop of Worcester and Winchester, and a member of the privy council. Among his works are *The True Difference between Christian Subjection and Unchristian Rebellion* (a vindication of queen Elizabeth's course toward the low countries), *The Perpetual Government of Christ's Church*, etc.

BILSTON, a t. in South Staffordshire, situated on a rising ground about 3 m. s.e. of Wolverhampton. Pop. '71, 24,188. It forms a part of the parliamentary borough of Wolverhampton. It has extensive iron and coal mines, iron smelting-works, iron-foundries for making machinery, besides works for manufacturing tinplate goods, japanned and enameled wares, nails, wire, screws, and coarse pottery. It is the center, indeed, of the hardware trade, and consequently a very busy place. Fine sand, adapted for metal-casting, is found here. Upwards of 700 persons died of cholera here both in 1832 and 1849.

BI'MA, a seaport in Sumbawa, one of the Sunda isles, and capital of a state of the same name, in lat. 8° 30′ s., and long. 119° east. It is on a bay of the n. coast, being 100 m. to the e. of Sumbawa, a town feudally dependent on its sultan. Its chief exports are horses and timber.

BI'MAH, a river of India, a branch of the Kistnah (q.v.), rises in the table-land of the district of Poona, in the presidency of Bombay, at an elevation of 3090 ft. above the level of the sea, and following in a south-eastward direction, falls into the Kistna, in n. lat. 16° 24′, e. long. 77° 20′, after a course of more than 500 miles.

BI'MANA (Lat. two-handed), in some zoological systems, the first order of *mammalia* (q.v.), an order containing the human species alone. See MAN. Others reject this order altogether, reclaiming against this classification of man with brutes, and maintaining

that the distance between him and them is too great to be represented as that between two orders in one class, or even between two classes of a zoological system. In assigning a place in this manner to man among animals, naturalists of course consider exclusively or chiefly his animal nature and bodily frame. The name B. has reference to the hands (q.v.) which terminate his anterior limbs; monkeys and lemurs, which, having opposable thumbs in all the four extremities, may be regarded as having four hands, although much less perfect than the human, are called *quadrumana* (q.v.); but none of the inferior animals are *two-handed*, as man is.

BIMI'NI, an island that never existed, supposed by Ponce de Leon to be among the Bahamas, and to contain the fountain that had power to restore youth and beauty. He found Florida, but neither any such island, nor any remarkable fountain.

BINAB', a t. of Persia, in the province of Azerbijan, charmingly situated on the banks of the Sofi Chai (a feeder of lake Urumiyah), in the midst of orchards and vineyards, about 55 m. s.s.w. of Tabriz. B. contains about 1500 houses; the streets are very clean, many of them having a stream of pure water, which is here very plentiful, flowing down the center. B. forms a dependency of Marághah, paying 4000 tómáns of revenue, and furnishing a quota of 400 men to the Azerbijan army.

BI'NARY COMPOUND. See BINARY THEORY.

BI'NARY STARS. See DOUBLE STARS.

BI'NARY THEORY, in chemistry, takes cognizance of the mode of construction of salts. It assumes that all salts contain merely two substances, which either are both simple, or of which one is simple, and the other a compound playing the part of a simple body. The best and most familiar illustration of the B. T. is common salt or chloride of sodium (NaCl), which is constructed of the metal sodium (Na) and the non-metal chlorine (Cl), and is at a glance seen to be a *binary compound* (a compound of two). In like manner, fluor-spar, or the fluoride of calcium (CaF), consists of the metal calcium (Ca) and the non-metal fluorine (F); iodide of potassium (KI), largely employed in photography, of potassium (K) and iodine (I); and bromide of silver (AgBr), also useful in photography, of silver (Ag) and bromine (Br). Considerable difficulty is experienced in including all salts under the B. T., but in many cases the apparent difficulty may be got over. Thus, saltpeter, or the nitrate of potash (KO,NO_5), according to the ordinary mode of representing its composition in symbols, naturally breaks up into potash (KO) and nitric acid (NO_5); but in this form it cannot be correctly included in the B. T. If, however, the same elements be arranged differently, as when the nitrate of potash (KNO_6) is represented as containing the metal potassium (K) and the compound non-metal nitrationide (NO_6), the latter playing the part of chlorine or other simple substance, the apparent barrier to the introduction of such salts into the list of those comprehended under the B. T. to a great extent disappears. The following table will represent this more clearly:

	SYMBOLS.	
	Ordinary Way.	Binary Theory.
Chloride of sodium	Na,Cl	Na,Cl
Nitrate of potash	KO,NO_5	K,NO_6
Sulphate of soda	NaO,SO_3	Na,SO_4
Carbonate of lime	CaO,CO_2	Ca,CO_3

Much, however, remains to be cleared up, and in very many cases the B. T. does not answer the purpose of including all salts under one class. See SALTS; see also CHEMISTRY.

BINAS'CO, a t. of Lombardy, about 11 m. n.w. of Pavia. It is defended by a castle, where, in Sept., 1418, Beatrice di Tenda, wife of the duke Filippo Maria, was beheaded by order of her husband, who unjustly suspected her of infidelity. Pop. about 1000.

BIN-BIR-KILISA' (One Thousand and One Churches), the name of extensive ruins in the pashalic of Karamania, Asia Minor, and 20 m. n.n.w. of the town of Karaman. The ruins consist chiefly of the remains of Byzantine churches, evidently of great antiquity, and some of very considerable size. B. is supposed to be the ancient Lystra, where the cripple was healed by St. Paul.

BINCHE, a t. of Belgium, province of Hainaut, on the Haine, about 10 m. e.s.e. of Mons. It is well built and walled, with a fine square, ornamented with a fountain, and has manufactures of leather, cutlery, pottery, glass, etc., and a considerable trade in lace, paper, marble, and coal. Pop. '70, about 7000.

BINDRABAN', a t. on the right bank of the Jumna, is situated in the district of Muttra and lieutenant-governorship of the n.w. provinces. It is in lat. 27° 34′ n., and long. 77° 45′ e., being 823 m. to the n.w. of Calcutta, and 92 to the s. of Delhi. The population of B., almost exclusively Hindu, was, in 1871, 21,500. The performance of religious rites appears to be the principal business of the place. Crowds of pilgrims come from all parts of India, more particularly in honor of Krishna; and, through the munificence of wealthy devotees, sacred edifices are constantly becoming more numerous and costly. Here, as at Benares, the immediate margin of the river is occupied by flights

of steps, or ghauts, as they are called. These extend for about a mile along the bank, being constructed of red stone, which is brought from Jeypore, nearly 150 m. distant.

BINDWEED. See CONVOLVULUS.

BINGEN (the ancient *Vincum* or *Bingium*), a t. in the grand-duchy of Hesse-Darmstadt, Germany, is situated in a charming country on the left bank of the Rhine, and on the right of the Nahe, here crossed by a bridge, generally supposed to have been built by the Romans, and called the bridge of Drusus. Pop. '75, 6404, who are chiefly engaged in the manufacture of fustian, leather, flannel, and tobacco. The vine is extensively cultivated in the surrounding country. The celebrated Scharlachberger wine is produced in the vineyard of the same name, near the village of Rüdesheim. In the vicinity of the town is the Rochusberg, with a chapel, to which annual pilgrimages are made. On the declivity of the hill are still to be seen the ruins of the old castle (blown up by the French in 1689), in which the emperor Henry IV. was detained a prisoner by his son in the year 1105. On the other side of the Nahe is the Rupertsberg, with the ruins of a monastery, in which St. Hildegarde resided in the 12th century. Below the town is the celebrated *Bingerloch*, formerly a very dangerous point in the navigation of the Rhine, on account of the sunk rocks which, with the exception of a narrow passage through which the waters rushed loud and furious, stretched across the river; but, in the year 1834, these rocks were partially blown up, so that there is no longer any great danger. In the middle of the river stands the tower, in which, according to the legend, bishop Hatto was devoured by rats in the year 969. History, however, fixes the date of the erection of the tower in the 13th c., as a toll-house for the collection of duties on goods passing this point in the river.

BINGHAM, HIRAM, 1790–1869; b. Vt.; a Congregational minister, graduate of Middlebury college and Andover seminary, and first missionary to the Sandwich islands, where he remained until 1841.

BINGHAM, JOSEPH, 1668–1723; an English clergyman, educated at Oxford; a tutor in the college in 1691, and a rector near Winchester somewhat later. Here he wrote his valuable *Antiquities of the Christian Church*. He was subsequently rector at Havant, near Portsmouth. Like many other simple souls of the period, he lost his little property in the "South sea bubble."

BINGHAMTON, a city in Broome co., N. Y., beautifully situated at the junction of the Chenango and the Susquehanna rivers, at the mouth of the Chenango canal, and on three railroads, the New York and Erie, the Syracuse and Binghamton, and the Albany and Susquehanna; pop. '75, 15,518. It is in a fine agricultural region, a few miles n. of the Pennsylvania line, and has a large local and canal and railroad trade. The rivers furnish abundant water-power, and there are a number of large manufactories. The most important public institution is the New York state asylum for inebriates, which has been in successful operation for several years. Other institutions are the Dean college, the Binghamton academy, a Roman Catholic academy, a high-school, and a dozen or more churches. Three daily and five weekly newspapers are issued here. B. was one of the earliest settlements in that section of the state. It is 214 m. n.n.w. of New York, and 142 m. s.w. of Albany, by rail.

BINGLEY, a t. and township in the West Riding of Yorkshire, 15 m. w.n.w. of Leeds, situated on an eminence in a well-wooded district, between the Aire and the Leeds and Liverpool canal. It chiefly consists of one long street. It has considerable worsted, cotton, and paper manufactures. Pop. '71, 15,952.

BINNACLE, formerly called *bittacle* (Fr. *habitacle*), is a wooden box or case for containing a ship's compass, together with other apparatus (especially a lamp) essential to its use. In large ships, there are generally two binnacles, one for the steersman, and one for the officer or seaman who "cons" or superintends the steering. Sometimes a lamp is so placed as to illuminate two compasses at night, sometimes only one. Many improvements have recently been made in binnacles. See COMPASS, MARINER'S.

BINNEY, AMOS, 1803–47; b. Boston; educated at Brown University, studied medicine, became a merchant, and afterwards devoted himself to science, being one of the founders and the first president of the Boston society of natural history, and of the American association of naturalists and geologists, over which he presided until his death. As a legislator, he promoted the scientific survey of the state; he wrote many valuable papers in the journal of the natural history society; devoted years to the study of mollusks, and wrote *Terrestrial and Air-breathing Mollusks of the United States and Adjacent Territories of North America*, which was published with fine illustrations after his death.

BINNEY, HORACE, LL.D., 1780–1875; b. Philadelphia; a distinguished lawyer, for many years at the head of the Pennsylvania bar; director in the U. S. Bank, and trustee to wind up its affairs. He was a member of congress in 1833–35, but held no other political office. One of his great cases was the defense of the city of Philadelphia against the suit of certain heirs of Stephen Girard. He wrote *The Leaders of the Old Bar of Philadelphia*, *The Privilege of the Writ of Habeas Corpus Under the Constitution*, and many valuable unpublished papers.

BINNEY, Rev. THOMAS, D.D., LL.D., one of the most distinguished modern preachers of the independents in England, was b. at Newcastle in 1798. After officiating as a clergyman in Newport, Isle of Wight, he in 1829 removed to London, where he soon acquired extensive popularity. The hall in which he preached becoming too small for his congregation, Weigh-house chapel, near London Bridge, was erected for him by his hearers in 1833. Here he continued to labor with great success for nearly 40 years, attracting around him a large number of the more intelligent class of young men in the metropolis. An address delivered at the opening of the new chapel, containing animadversions on the English church, brought B. into notoriety from the replies it called forth from many English clergymen. He afterwards took the more liberal side in the *Rivulet* controversy regarding the orthodoxy of certain hymns of high poetic merit, written by the Rev. T. Lynch of London. In 1845 he visited Canada and the United States; and in 1857–59 made a successful preaching and lecturing tour in Australia. He resigned in 1871 the pastorate of Weigh-house chapel. As a preacher, B. was remarkable less as an orator than for breadth of view, originality of thought, and force of expression. Among the most popular of his religious works are: *Conscientious Clerical Nonconformity, The Practical Power of Faith, Service of Song in the House of the Lord, Money,* and *Is it Possible to make the Best of Both Worlds?* He died in 1874.—See *Memorial of B.,* edited by John Stoughton, D.D., 1875.

BINOCULAR MICROSCOPE, a microscope adapted to be used by both eyes at the same time. It has only one set of object glasses, but the pencil of light, after passing these lenses, is divided, and the parts are sent to the eyes separately. The division is caused by a trapezoidal prism that is pushed latterally into the pencil of light, cutting off one half; the other half goes on directly to one eye. That part of the pencil which is obstructed enters the lower face of the prism normally and is not there changed; it meets the second face internally at such an angle as causes it to be wholly reflected and to pass back through the glass to the third face; here it is again totally reflected, and it passes thence out of the glass normally through the fourth face. The result at all these changes of direction is to give it a path, slightly oblique, to that of the unchanged ray, that will carry it through an oblique tube to the second eye. The rays of light cross in the objective; hence, to obtain a stereoscopic effect—that is, to cause the object to stand forth as a solid, its three dimensions being properly appreciated—the light which comes from the left side of the object must enter the right eye, and *vice versa.* Should the light from the right side enter the right eye, a pseudoscopic effect follows; projections seem hollows, and hollows look like elevations. The binocular microscope has two eye pieces. It is restful to the eyes, and with low powers gives information not to be had otherwise, showing the depth, as well as the length and breadth, of the thing observed. The binocular telescope has two tubes and two sets of lenses throughout. A pair of opera-glasses is a familiar example.

BINO'MIAL, in algebra, is a quantity consisting of two terms or parts—e.g., $a+b$, or $9-5$; a *trinomial* consists of three terms, as $a+b+c$, or $10+5-8$. The BINOMIAL THEOREM is that remarkable series of analytical formula by which any power of a B. can be expressed and developed. Thus, the 8th or any other power of $a+b$ can be at once written down without going through the actual multiplication of $a+b$ by itself for the given number of times. The older mathematicians were acquainted with this theorem in the case of integral exponents, though the actual discoverer is unknown. Newton was the first to demonstrate its truth for all exponents—fractional and negative, as well as integral. It is one of the finest of his discoveries, and is engraved on his tomb. Among its many applications, it affords the means of finding any root of any number much more conveniently than by the usual method of extraction.

BINON'DO, a t. of the island of Luzon, Philippines, on the right bank of the Pasig, opposite to Manilla, with which it is connected by a magnificent stone bridge, 411 ft. in length. This bridge is regarded as the greatest structure erected by Europeans in the east. B. is chiefly inhabited by natives of the Philippines, but is also the residence of some Europeans. It is the seat of government of the province of Tondo. Pop. 29,200.

BINTANG', an island of the Dutch East Indies, about 40 m. s.e. of Singapore, and in lat. 1° 5′ n., long. 104° 29′ east. Area, 600 sq. miles. Pop., including that of small adjacent isles, 13,000. It is calculated that not less than 4000 tons of the astringent gum called gambir are obtained here annually. This, along with rice and pepper, forms its chief exports.

BINTURONG, *Ictides,* a genus of quadrupeds nearly allied to raccoons (q.v.), from which the chief distinction is in the smaller and less tuberculated back molar (grinder) teeth. Only two species are known, natives of Malacca, Java, Sumatra, etc.

BI'OBI'O, the largest river of Chili, has a w.n.w. course from the Andes to Concepcion on the Pacific, being 2 m. wide at its mouth, and navigable for boats from the sea to the mountains. Its lower stream separates the province of Concepcion on the n. from independent Araucania on the south.

BIOGRAPHY (from the Gr. *bios*, life, and *graphē* writing) is the term applied to that department of literature which treats of the lives of individuals. The mode of treatment, especially in modern times, is far from uniform. In some cases, B. approaches the sphere of philosophy; in others, that of history; while in the majority it assumes, to a large extent, the character of analytic or descriptive criticism. To none of these modes, theoretically considered, can there be any valid objection; everything depends on the judiciousness of the biographer. The great points which he must keep perpetually in view are the personality and characteristics of his subject. If these are buried under a load of digressive dissertations, his book, however valuable or interesting, ceases to be a B., except in name. Anciently, B. was more of a mere *curriculum vitæ* than it is now; that is to say, the leading incidents of a man's life were narrated in their historical sequence, without any elaborate attempt to analyze the character from which they emanated. Like ancient history, it was possessed of a simple greatness, a stately dignity of narrative, colored here and there but sparingly with grave eulogy or censure. Modern B., on the other hand, like modern history, is full of elucidations, criticism, and disquisition; and if wanting in the severe grace of its classic predecessor, it is much more lively, acute, and expansive.

Biographical literature appears to have existed from a very early period. The oldest historical books of the Jews abound with beautiful examples of it, such as the lives of the patriarchs and the story of Ruth. But what, indeed, are the mythologies of all ancient nations, except a chaos of heroic or divine biographies written not on walls of stone or rolls of parchment, or leaves of papyrus, but on the tablets of the memory? Of purely biographical works, the most valuable that has come down to us from the Greeks is the *Parallel Lives* of Plutarch, a composition of the 2d c. after Christ. Roman literature also possesses an admirable specimen in the *Life of Agricola* by his son-in-law, Tacitus. Besides these may be mentioned the *Life of Alexander the Great* (in Latin) by Curtius, and of *Apollonius of Tyana* (in Greek) by Philostratus, *Lives of the Sophists* (in Greek) by Philostratus, and a *Life of Plato* (in Greek) by Olympiodorus of Alexandria.

Coming later down, we encounter St. Jerome's *Lives of the Fathers;* while biographies, more or less complete, of saints, martyrs, bishops, etc., are scattered profusely through primitive ecclesiastical literature. The monks of the middle ages also worked hard at the manufacture of absurd and superstitious legendary biographies, in which the hunger for the marvelous characteristic of that credulous time was hugely gratified. Modern biographical literature may be said to date from the 17th c., and has since developed itself to an unmanageable extent. Among the most valuable works belonging to this class, written since the reformation, may be mentioned Vasari's *Lives of the Painters* (Florence, 1550); the *Acta Sanctorum* (q.v.); Tillemont's *Mémoires pour servir à l'Histoire Ecclésiastique des six Premières Siècles de l'Englise*, in 16 vols. 4to (Paris, 1693); Thomas Stanley's *History of Philosophy, containing the Lives, Opinions, Actions, and Discourses of Philosophers of every Sect* (1655–62); Bayle's *Dictionaire Historique et Critique* (Rotterdam, 1697); Johnson's *Lives of the Poets* (completed in 1781); the *Biographie Universelle* (1810–28); *Conversations-Lexicon* (10th edition, 1851–55); Charles Knight's *English Cyclopædia*, biographical section (1856–57). As for individual biographies in modern times, it would be endless to enumerate them. It having unhappily been discovered that these constitute the most attractive form of literature, the world is annually inundated with an intolerable flood of lives of nobodies. At present, the most insignificant literary, clerical, or philanthropical personages are not permitted to pass quietly away. Nevertheless, amid the desert of commonplace, the choicest oases may be found; works so rich in pleasant or profound thought, so copious in agreeable gossip, so valuable in unexpected glimpses and revelations of character, so abundant, in short, in everything that can stimulate, elevate, or enlighten, that it is not wonderful they should be read and re-read with avidity. Chief among such in our own country is Boswell's *Life of Johnson* (1790). During the present century also appeared the *Life of John Sterling*, by Thomas Carlyle, a work which is considered a model of its kind; and the *Life of Goethe* by G. H. Lewes, which has been universally accepted, both in Germany and England, as an adequate B. of the illustrious monarch of continental literature. In France, where B., at least in the shape of "memoirs," has attained perfection, we may specify among others the *Life of Descartes* by Baillet, of *Charles XII.* by Voltaire, of *Voltaire* by Condorcet, of *Fénélon* and *Bossuet* by cardinal de Bausset, of *Molière* and *Corneille* by M. Taschereau, and of *Monk* by Guizot. In Germany, among others, we have the *Life of Heyne* by Heeren, of *Reinhard* by Poelitz, and of *Dorothea, Duchess of Courland*, by Tiedge; while America has contributed the valuable *Life of Christopher Columbus* by Washington Irving.

An *autobiography* is the life of a person written by him or her self. This branch of literature, also, has become superabundant in this egotistic and self-conscious age. Unquestionably the highest work in this department of literature is Goethe's *Dichtung und Wahrheit*, a kind of idealized autobiography, in which the outward and inward truth, the fact and poetry of the author's life, are strangely but beautifully interwoven.

BIOLOGY (Gr.), or the science of life, embraces properly all knowledge regarding organized beings as distinguished from the inorganic world. But in a narrower sense it designates much the same as human physiology (q.v. and LIFE).

BIOLOGY (*ante*), a title under which are classed the sciences that deal with the phenomena manifested by living matter. It is customary to make a separate group of such phenomena as pertain especially to mental organization, under the titles of "psychology" and "sociology," but no natural line can be assigned as separating the subject-matter under those heads from the more comprehensive term at the head of this article. Psychology is closely connected with physiology; while there are phases of social life exhibited by animals, as well as men, which come within the province of the biologist. The biological sciences, on the other hand, are distinctly separated from those which treat of non-living matter, so far as the properties of living matter distinguish it clearly from all other things, and inasmuch as the present state of knowledge furnishes no link between the living and the non-living.

The distinctive PROPERTIES OF LIVING MATTER are: 1. Its *chemical composition*, consisting always of one or more complex forms of a compound of carbon, hydrogen, oxygen, and nitrogen, the so-called proteine—which has not been found except as a product of living bodies—joined with a large proportion of water, and forming the chief constituent of a substance which, in its primary state, is called protoplasm. 2. Its *universal disintegration* and *waste by oxidation*, and its *concomitant reintegration by the intussusception of new matter*. A process of waste following the decomposition of the molecules of the protoplasm, in virtue of which they divide into more highly oxidated products which cease to form any portion of the living body, is a constant phenomenon of life. It is thought that one of these waste products is carbonic acid, and that the others contain the remainder of the carbon, nitrogen, hydrogen, and other elements in the composition of the protoplasm. The new matter, received to make good this constant loss, is either already-formed protoplasmic material, supplied by another living thing, or may be elements of the protoplasm united in simpler combinations which have constantly to be built into protoplasm by the agency of the living matter itself. In either case the addition of molecules to those already existing is by interposition between the existing molecules, and not at the surface of the living mass. If the processes of disintegration and reconstruction which characterize life balance each other, the size of the living mass remains stationary; but if the reconstructive process is more rapid than the disintegrative, the living body is enlarged or grows. However, the increase of size which constitutes growth is the result of molecular intussusception, and differs from growth by accretion (as may be observed in crystals), which is effected solely by the addition externally of new matter; therefore, the term "grow" as applied to stones signifies a process entirely different from "growth" of animals and plants. 3. Its *tendency to undergo cyclical changes*. In nature's ordinary course all living matter proceeds from pre-existing living matter, some portion of the latter being detached and acquiring a separate and independent existence. The latest forms have the family characteristics of parentage or descent, the same power and process of reproducing the same life, or nearly so, ending their life after the manner of the parent, and being resolved into more highly oxidated compounds of their elements. A particular living body constantly changes not only its substance, but also its form and size, the end of which is the decay and death of that particular body, the continuation of its kind being provided for by the detachment of parts, which pass through the same series of forms as the parent. No forms of non-living matter, not derived from a living source, will exhibit these three properties, nor will they approach to the singular phenomena explained under the above 2d and 3d heads. Living matter has some other peculiarities, the principal of which are: the dependence of all its activities upon moisture (and heat within a limited range) and the fact that it usually has a certain structure or organization. As to *moisture*, there is a large proportion of water in all living matter; drying to a certain point arrests vital activity, and the entire absence of water is incompatible with either actual or potential life. Still, many of the simple forms may be dried so as to appear to be non-living matter while they are yet potentially alive, and on receiving proper moisture may return to active existence months or even years after apparent death. *Temperature* in a proper degree is a necessary condition of life; but more or less heat may destroy life altogether by breaking up the molecular structure on which that life depends. All vital activity, and all the phenomena of nutritive growth, movement, and reproduction are possible only between certain limits of temperature. As the temperature nears these limits the manifestations of life weaken and vanish, though they may recover by a return to normal conditions; but any considerable transcending of the natural limits of temperature must result in death. These limits of temperature are not clearly definable, since they vary widely with varying matter, and with the conditions of moisture that accompany temperature. Satisfactory experiments on these points are possible only among the lowest and simplest forms of life; but it has been shown that organisms in a dry state can bear much greater heat than when moist. The spores of fungi in a dry condition have borne 248° to 257° Fahr., but the same spores when moist were killed at 212°. Dry yeast has borne the surprising temperature of 76° below zero without being killed; and in a moist condition it has been frozen to 23° without killing; but a lower reduction destroyed life. The resistance of living matter to cold depends greatly on the special form of the matter; but it should be added that experiments have not been numerous enough to establish definite limits. There are vegetable growths at great heights in temperate climates, while in the arctic regions they cover wide spaces of snow and ice, where

the cold is extreme and continues for months together; while the polar seas, north and south, swarm with *diatomaceæ* and *radiolaria*. It is on the *diatomaceæ* that all surface life in these regions ultimately depends, and their enormous quantity proves that their rate of multiplication is adequate to meet the demands made upon them, and that it is not seriously impeded by the low temperature of the water in which they habitually live, a temperature seldom much above freezing. Turning to the maximum of heat that life can endure, we find an equally wide variation. Cohn gives the results of a series of experiments conducted with the view of ascertaining the temperature at which *bacteria* are destroyed when living in a fluid of definite chemical composition. He made a fluid containing one tenth of a gramme of potassium phosphate, one tenth of a gramme of crystallized magnesium sulphate, one tenth of a gramme of tribasic calcium phosphate, and two tenths of a gramme of ammonium tartrate, dissolved in 20 cubic centimetres of distilled water. If to this fluid a small portion of water containing *bacteria* was added, the multiplication of the *bacteria* went on rapidly, whether the vessel was open or closed. Such vessels, hermetically sealed, were immersed in water in various temperatures. In those subjected for an hour to 143° Fahr., the *bacteria* underwent no development, the fluid remaining clear; but at even 122° the fluid became turbid in two or three days in consequence of the multiplication of the *bacteria*. It is generally believed that the simpler forms of vegetable life are killed at 140°; but *algæ* live in hot springs at even 208°. Late investigations lead to the conclusion that the immediate cause of the arrest, in the first place, of vitality, and, in the second place, of its destruction, is the coagulation of certain substances in the protoplasm, and that the latter contains various coagulable matters which solidify at certain temperatures.

As to *life* and *organization*, a recent writer remarks: It may be safely said of all living things, large enough to enable us to trust the evidence of microscopes, that they are optically heterogeneous, and that their different parts, especially the surface layers as contrasted with exteriors, differ physically and chemically; while in most living things, mere heterogeneity is exchanged for a definite structure, whereby the body is distinguished into visible parts, which possess different powers or functions. Living things which present this visible structure are said to be "organized;" and so widely does organization obtain among living beings, that "organized" and "living" are not unfrequently used as if they were terms of coextensive applicability. This is not exactly accurate, if it thereby be implied that all living things have a visible organization, as there are numerous forms of living matter of which it cannot properly be said that they possess either a definite structure or permanently specialized organs; though doubtless the simplest particle of living matter must possess a highly complex molecular structure far beyond the reach of vision. The broad distinctions which, as a matter of fact, exist between every known form of living substance and every other component of the material world, justify the separation of the biological sciences from all others. But it must not be supposed that the differences between living and non-living matter are such as to justify the assumption that the forces at work in the one are different from those which are to be met with in the other. Considered apart from the phenomena of consciousness, the phenomena of life are all dependent upon the working of the same physical and chemical forces as those which are active in the rest of the world. It may be convenient to use the terms "vitality" and "vital force" to denote the causes of certain great groups of natural operations, as we employ "electricity" and "electrical force" to denote others; but it ceases to be proper to do so if such a name implies the absurd assumption that "electricity" and "vitality" are entities playing the part of efficient causes of electrical or vital phenomena. A mass of living protoplasm is simply a molecular machine of great complexity, the total results of the working of which, of its vital phenomena, depend on the one hand upon its construction, and on the other upon the energy supplied to it; and to speak of "vitality" as anything but the name of a series of operations, is as if one should talk of the "horology" of a clock.—(*Huxley.*) Other writers, objecting to this use of terms, call attention to the fact that even if the term "vitality" be thus limited in science to a series of operations, the term "life" is not thereby precluded from a larger application.

Coming to the CLASSIFICATION OF THE PHENOMENA OF LIFE, we find that living matter, or protoplasm, and the products of its metamorphoses, may be regarded under four aspects: 1. It has a certain external and internal form, the latter being usually called "structure." 2. It occupies a certain position in space and time. 3. It is the subject of the operation of certain forces, by virtue of which it undergoes internal changes, modifies external objects, and is modified by them. 4. Its form, place, and powers are the effects of certain causes corresponding to these four aspects. Biology is separated into four chief subdivisions, which are: I. Morphology; II. Distribution; III. Physiology; IV. Ætiology.

I. MORPHOLOGY. As far as living beings have form and structure they come within the province of *anatomy* and *histology*, the latter being the name for microscopic analysis of living forms. When the form and structure of a living being are not the same during its whole existence, but undergo changes, such beings have *development*, and the history of development is an account of the anatomy of a living being at successive epochs of its existence, and of the manner in which one anatomical stage passes into another. Finally, the systematic statement and generalization of the facts of morphology, in such

a manner as to arrange living beings into groups according to their degrees of likeness, is *taxonomy*. The study of anatomy and development has brought out certain generalizations of wide applicability and importance.

1. Most plants and animals are aggregates of cells. Ordinary dissection by unassisted vision suffices to separate the body of any of the higher animals or plants into fabrics of different sorts, which in the same organism always present the same general arrangement, but in different organisms are combined in differing manner. The discrimination of these comparatively few fabrics, or tissues, of which organisms are composed, was the first step toward that ultimate analysis of visible structure which has become possible only by recent perfection of microscopes and improved methods of preparation. Histology, which embodies the results of such analysis, shows that every tissue of a plant is composed of more or less modified structural elements, each of which is called a cell; and this cell in its simplest condition is only a mass of plotoplasm, surrounded by a coat or sac called the cell-wall, which contains cellulose. In various tissues the cells may undergo innumerable changes of form, the protoplasm may change into a nucleus with its nucleolus, a primordial utricle, and a cavity filled with watery fluid, and the cell-wall may be altered in composition or structure, or may coalesce with other cell-walls. But however extensive these changes may be, the fact remains clear that the tissues are made up of morphologically distinct units, which are the cells. Every plant, so far as traceable, may be said to commence existence as a simple cell, identical in its fundamental characteristics with the least modified of those cells of which the whole body is composed. Cell-walls, however, are not always necessary. There are plants which spend a portion of their existence in the condition of a spheroid of protoplasm, with nothing like a wall, while at other times the protoplasmic body becomes inclosed within a cell-wall fabricated by its superficial layer. Therefore, just as the nucleus, the primordial utricle, and the central fluid are no essential constituents of the morphological unit of the plant, but represent results of its metamorphoses, so the cell-wall is equally unessential; and either the term "cell" must acquire a merely technical significance as the equivalent of "morphological unit," or some new term must be invented to describe the latter. Probably it would be least inconvenient to modify the signification of the term "cell."

Analysis of animal tissue has led to similar difficulties in terminology. In the higher animals, however, the modifications which the cells undergo are so extensive that the fact that the tissues are, as in plants, resolvable into an aggregation of morphological units, could never have been established without the aid of the study of development, which proves that the animal, no less than the plant, commences its traceable existence as a simple cell, fundamentally identical with the less modified cells which are found in the tissues of the adult. Though the nucleus is almost constant among animal cells, it is not universally present; and among the lowest forms of animal life the protoplasmic mass which represents the morphological unit may be, as in the lowest plants, devoid of a nucleus. In the animal the cell-wall never has the character of a shut sac containing cellulose: and it is not a little difficult, in many cases, to say how much of the so-called cell-wall of the animal cell answers to the primordial utricle, and how much to the proper "cellulose cell-wall" of the vegetable cell. But it is certain that in the animal, as in the plant, neither cell-wall nor nucleus are essential constituents of the cell, inasmuch as bodies which are unquestionably the equivalents of cells—true morphological units—are mere masses of protoplasm, devoid alike of cell-wall and nucleus.

It results, then, for the whole living world, that the morphological unit—the primary and fundamental form of life—is only an individual mass of protoplasm, in which no further structure is discoverable; that independent living forms may present but little advance on this structure; and that all the higher forms of life are aggregates of such morphological units or cells, variously modified. All that is at present known tends to the conclusion that, in the complex aggregates of such units of which all the higher animals and plants consist, no cell has risen otherwise than by becoming separated from the protoplasm of a pre-existing cell.

2. In the course of its development, every cell proceeds from a condition in which it closely resembles every other cell, through stages of gradually increasing divergence, until it reaches the condition in which it presents the characteristic features of the elements of a special tissue. The development of the cell is, therefore, a gradual progress from the general to the special condition. The same holds good of the development of the body as a whole. However complicated one of the higher animals or plants may be, it begins its separate existence under the form of a nucleated cell, which by division becomes converted into an aggregate of similar cells; the parts of this aggregate, following different laws of growth and multiplication, give rise to the rudiments of the organs; and the parts of these rudiments again take on those modes of growth and multiplication and metamorphosis which are needful to convert the rudiment into the perfect structure. The development of the organism as a whole repeats the development of the cell. It is progress from a general to a special form, resulting from the gradual differentiation of the originally similar morphological units of which the body is composed. When the steps, of the development of two animals are compared, the number of the steps that are similar to one another will be found proportioned to the closeness of the resemblance of the adult forms; so it follows that the more closely any two animals are allied at full-

growth of structure, the later are their embryonic conditions distinguishable; a law that is alike in both plants and animals.

3. Development, then, is a process of differentiation by which the primitively similar parts of the living body become more and more unlike one another. This process of differentiation may be effected in several ways. The protoplasm of the germ may *not* undergo division and conversion into a cell aggregate; but in various parts of its outer and inner substance may be metamorphosed directly into those physically and chemically different materials which constitute the body of the adult. This occurs in such animal life as that of *infusoria*, and in such plants as the unicellular *algæ*. But the germ *may* undergo division and be converted into an aggregate of cells, which cells give rise to the tissues by undergoing a metamorphosis of the same kind as that to which the whole body is subjected in the case just mentioned. The body, formed in either of these ways, may, as a whole, undergo metamorphoses by differentiation of its parts, and the differentiation may take place without reference to any axis of symmetry, or it may have reference to such an axis. In the latter case, the parts of the body which become distinguishable may correspond on the two sides of the axis, making bilateral symmetry, or may correspond along several lines paralled with the axis, making radial symmetry. The bilateral or radial symmetry of the body may be further complicated by its segmentation, or separation by divisions, transverse to the axis, into parts, each of which corresponds with its predecessor or successor in the series. In the segmented body the segments may or may not give rise to symmetrically or unsymmetrically disposed processes, which are *appendages*, in the general sense of the word. And the highest degree of complication of structure in both animals and plants is attained by the body when it becomes divided into segments provided with appendages; when the segments not only become very different from one another, but some coalesce and lose their primitive distinctness; and when the appendages and the segments into which they are subdivided similarly become differentiated and coalesce. By such processes the flowers of some plants and the heads and limbs of some animals attain their extraordinary diversity and complication of structure. A flower-bud is a segmented body or axis, with a certain number of whorls of appendages; and the perfect flower is the result of the gradual differentiation and confluence of these primitively similar segments and their appendages. The head of an insect is, in like manner, made of segments, each with its pair of appendages, which, by differentiation and confluence, are converted into feelers and variously modified oral appendages of the adult.

In all animals which consist of cell-aggregates, the cells of which the embryo is at first composed arrange themselves by the splitting, or by a process of invagination, of the blastoderm into two layers, the *epiblast*, and the *hypoblast*, between which a third intermediate layer—the *mesoblast*—appears, and each layer gives rise to a definite group of organs in the adult. In the *vertebrata* the epiblast gives rise to the cerebro-spinal axis, and the epidermis and its derivatives; the hypoblast to the epithelium of the alimentary canal and its derivatives; and the mesoblast to all the intermediate structures. The tendency of late research is to prove that the several layers of the germ evolve analogous organs in invertebrate animals, and to indicate the possibility of tracing the several germ-layers back to the blastomeres of the yelk, from the subdivision of which they all proceed.

It may be conceived that all forms of life should have presented nearly the same differentiation of structure, and should have differed from one another by superficial characteristics, each form passing by insensible gradation into those most like it. In such case, taxonomy (the classification of morphological facts) must have been confined to forming an arrangement representing the serial gradation of these forms in nature. Or it may be conceived that living beings should have differed as widely in structure as they really do, but that the interval between any two extreme forms should have been filled up by an unbroken series of gradations; in which case classification could effect the formation of series only, the strict definition of groups being as impossible as in the former case. But, in fact, living beings differ widely, not only in structure but in the modes in which the differences are brought about; and the intervals between extreme forms are not filled up in the existing world by complete series of gradations. Hence living beings are, to a great extent, susceptible of classification into groups, the members of each group resembling one another, and differing from all the rest by definite peculiarities. No two living beings are exactly alike, but among endless diversities some constantly resemble one another so closely that it is impossible to draw a line of demarkation between them, while they differ only in such characteristics as are associated with sex. These constitute a morphological species; while different *morphological species* are defined by constant characteristics that are not merely sexual. Generic groups thus constituted may be arranged into families, orders, classes, etc.

II. Distribution.—Living beings are different in different zones of the earth and in different heights above the sea, or in different climates; and the same is true of living things in the sea. And places that differ in longitude though not differing in climate, may have different animals and plants. Certain areas are inhabited by animal or vegetable groups that are not found elsewhere. Such areas are denominated *provinces of distribution*. Such areas have no common agreements, either in extent, boundaries, or physical features. Indeed, there are no phenomena in nature more capricious and arbitrary

than the distribution of living things. The revelations of geology give us an idea of the distribution of long extinct species of animal and vegetable life, and we find that entirely different life is now found where these creatures once existed; and the further we go back the wider the differences. In any locality the succession of living forms may appear to be interrupted by numerous breaks; but the tendency of palæontological investigation is to show that these breaks are only apparent. It is evident, both with regard to animals and plants, that the changes in the living population of the earth which have taken place during its history, have been effected not by the sudden displacement of one set of living beings by another but by a process of gradual introduction of new species and the extinction of older forms. In all parts of the globe in which fossiliferous rocks have been examined, the successive terms of the series of living forms have succeeded each other in a uniform way.

III. PHYSIOLOGY.—The activities of living matter are called its functions; and those functions, though widely varied, may be arranged in three categories. They are: 1. Functions that affect the material composition of the body and determine its mass, which is the balance of the processes of waste on one hand, and those of assimilation on the other. 2. Functions which subserve the process of reproduction, which is essentially the detachment of a part endowed with the power of developing into an independent whole. 3. Functions in virtue of which one part of the body is able to exert a direct influence on another, and the body, by its parts, or as a whole, becomes a source of molecular motion. These categories are, 1, *sustentative;* 2, *generative;* 3, *correlative* functions. Of the three classes of functions the first two are invariably present in living beings. Some of the lower *fungi* do not possess the power of changing the form, or the correlative functions. In most of the lower plants, however, and in all known animals, the body either constantly or temporarily changes its form, either with or without the application of a special stimulus, and thereby changes the relations of its parts to one another, and of the whole to other bodies. The higher animals produce such changes by means of a special tissue called nerve; motion on a large scale is effected by another tissue, *muscle;* and the organism is brought into relation with surrounding things by another special tissue—that of the *sensory organs*, by means of which the forces exerted by surrounding bodies are transmuted into affections of nerve. In the lowest forms of life the functions that have been enumerated are seen in their simplest forms, and they are exerted indifferently, or nearly so, by all parts of the protoplasmic body; and the same is true of the functions of the body of even the highest organisms, so long as they are in the condition of the nucleated cell which constitutes the starting point of their development. But the first process in that development is the division of the germ into a number of morphological units or blastomeres, which eventually give rise to cells; and as each of these possesses the same physiological functions as the germ itself, it follows that each morphological unit is also a physiological unit, and the multicellular mass is strictly a compound organism made up of a multitude of physiologically independent cells. The physiological activities manifested by the complex whole represent the sum, or rather the resultant, of the separate and independent physiological activities resident in each of the simpler constituents of the whole.

The morphological changes which the cells undergo in the course of further development of the organism do not affect their individuality; and, notwithstanding the modification and confluence of its constituent cells, the adult organism, however complex, is still an aggregate of morphological units. Not less is it an aggregate of physiological units, each of which retains its fundamental independence, though that independence becomes restricted in various ways. Each cell, or that element of a tissue which proceeds from the modification of a cell, must retain its sustentative functions so long as it grows or maintains a condition of equilibrium; but the most completely metamorphosed cells show no trace of the generative function, and many exhibit no correlative functions. On the other hand, those cells of the adult organism which are the unmetamorphosed derivatives of the germ, exhibit all the primary functions, not only nourishing themselves and growing, but multiplying, and frequently showing more or less marked movements.

Organs are parts of the body which perform particular functions. Perhaps it is not strictly right to speak of organs of sustentation or generation, each of these functions being necessarily performed by the morphological unit which is nourished or reproduced. What are called the organs of these functions are the apparatuses by which certain operations subsidiary to sustentation and generation are carried on. Thus in the case of sustentative function, all those organs may be said to contribute to this function which are concerned in bringing nutriment within reach of the ultimate cells, or in removing waste matter from them; while in the case of the generative function, all those organs contribute to the functions which produce the cells from which germs are given off, or help the evacuation, or fertilization, or development of those germs. On the other hand, the correlative functions, so long as they are exerted by a simple undifferentiated morphological unit or cell, are of the simplest character, consisting of those modifications of position which can be effected by mere changes in the form or arrangement of the parts of the protoplasm, or of those prolongations of the protoplasm which are called pseudopodia or cilia. But, in the higher animals and plants, the movements of the organism and of its parts are brought about by the changes of the form of certain

tissues, the property of which is to shorten in one direction when exposed to certain stimuli. Such tissues are termed *contractile*, and, in their most fully developed condition, *muscular*. The stimulus by which this contraction is naturally brought about is a molecular change, either in the substance of the contractile tissue itself, or in some other part of the body; in which latter case the motion which is set up in that part of the body must be propagated to the contractile tissue through the intermediate substance of the body. In plants there seems to be no question that parts which retain a hardly modified cellular structure may serve as channels for the transmission of this molecular motion; whether the same is true of animals is not certain. But in all the more complex animals, a peculiar fibrous tissue (nerve) serves as the agent by which contractile tissue is affected by changes occurring elsewhere, and by which contractions thus initiated are co-ordinated and brought into harmonious combination. While the sustentative functions in the higher forms of life are still, as in the lower, fundamentally dependent upon the powers inherent in all the physiological units which make up the body, the correlative functions are, in the former, deputed to two sets of specially modified units, which constitute the muscular and nervous tissues.

When we compare the different forms of life together as physiological machines, we find that they differ as do machines of human construction. In the lower forms, the mechanism, though perfectly adapted to the work to be done, is rough, simple, and weak; while in the higher forms, it is finished, complicated, and powerful. Considered as machines, the difference between a polyp and a horse suggests that between the distaff and the spinning-jenny. In the progress from the lower to the higher organisms there is a gradual differentiation of organs and of functions. Each function is separated into many parts, which are severally intrusted to distinct organs—a sort of equitable division of physiological labor. And precisely the same process is observable in the development of any of the higher organisms; so that, physiologically as well as morphologically, development is a progress from the general to the special.

Conditions of Existence.—Thus far the physiological activities of living matter have been considered in themselves, and without reference to anything that may affect them in the world outside the living body. But living matter acts on, and is powerfully affected by, the bodies which surround it; and the study of the influence of the conditions of existence thus determined constitutes a most important part of physiology. The sustentative functions, for example, can be exerted only under certain conditions of temperature, pressure, and light, in certain media, and with supplies of particular kinds of nutritive matter; the sufficiency of which supplies is again greatly influenced by the competition of other organisms, which, striving to satisfy the same need, give rise to the *passive* "struggle for existence." The exercise of the correlative functions is influenced by similar conditions, and by direct conflict with other organisms, which constitute the *active* "struggle for existence," and, finally, the generative functions are subject to extensive modifications, dependent partly upon what are commonly called external conditions, and partly upon wholly unknown agencies. In the lowest forms of life, the only mode of generation at present known is the division of the body into two or more parts, each of which then grows to the size and assumes the form of the parent, and repeats the same process of multiplication. This method of multiplication by *fission* is properly called generation, because the parts which are separated are severally competent to give rise to individual organisms of the same nature as that from which they arose. In many of the lowest organisms the process is modified so far that, instead of the parent dividing into two equal parts, only a small portion of its substance is detached, as a bud, which develops into the likeness of the tree from which it was taken. This is generation by *gemmation*. Generation by fission and by gemmation are not confined to the simplest forms of life, however. Both modes of multiplication are common not only among plants, but among animals of considerable complexity. The multiplication of flowering plants by bulbs, that of animals by fission, and that of polyps by budding, are well-known examples of these modes of reproduction. In all the cases the bud or segment consists of a multitude of more or less metamorphosed cells. But, in other instances, a single cell detached from a mass of such undifferentiated cells contained in the parental organism is the foundation of the new organism, and it is hard to say whether such a detached cell may be more fitly called a bud or a segment—whether the process is more akin to fission or to gemmation. In all these cases the development of the new being from the detached germ takes place without the influence of other living matter. Common as the process is in plants and in the lower animals, it becomes rare among the higher animals. In these the reproduction of the whole organism from a part, in the way indicated above, ceases. At most we find that the cells at the end of an amputated portion of the organism are capable of reproducing the lost part; and, in the very highest animals, even this power vanishes in the adult; and, in most parts of the body, though the undifferentiated cells are capable of multiplication, their progeny grow, not into whole organisms like that of which they form a part, but into elements of the tissues.

Throughout almost the whole series of living beings, however, we find concurrently with the process of *agamagenesis*, or a sexual generation, another method of generation, in which the development of the germ into an organism resembling the parent depends on an influence exerted by living matter differing from the germ. This is *gamogenesis*, or

sexual generation. Looking at the facts broadly, and without reference to exceptions in detail, it may be said that there is an inverse relation between agamogenetic and gamogenetic reproduction. In the lowest organisms the latter has not yet been observed, while in the highest the former is absent. In many of the lower forms of life, agamogenesis is the common and predominant mode of reproduction, while gamogenesis is exceptional; on the contrary, in many of the higher, while gamogenesis is the rule, agamogenesis is an occasional exception. In the simplest condition, that termed *conjugation*, sexual generation consists in the coalescence of two similar masses of protoplasmic matter, derived from different parts of the same organisms of the same species, and the single mass which results from the fusion develops into a new organism. In the majority of cases, however, there is a marked morphological difference between the two factors in the process, and then one is called the male, and the other the female element. The female element is relatively large, and undergoes but little change of form. In all the higher plants and animals, it is a nucleated cell, to which a greater or less amount of nutritive material, constituting the food-yelk, may be added. The male element, on the other hand, is relatively small. It may be conveyed to the female element by an outer growth of the wall of its cell, which is short in many *algæ* and *fungi*, but becomes an immensely elongated tubular filament in the case of the pollen cell of flowering plants. But more commonly the protoplasm of the male cell becomes converted into rods or filaments, which usually are in active vibratory movement, and sometimes are propelled by numerous cilia. Occasionally they are devoid of mobility, as in many *arthropoda* and *nematoidea*. The manner in which the contents of the pollen tube affect the embryo cell in flowering plants is unknown, as no perforations through which the contents of the pollen tube may pass so as actually to mix with the substance of the embryo cell have been discerned; and there is the same difficulty with respect to the conjugative processes of some of the *cryptogamia*. But in the great majority of plants, and in all animals, there can be no doubt that the substance of the male element actually mixes with that of the female, so that in all these cases the sexual process remains one of conjugation; and impregnation is the physical admixture of protoplasmic matter derived from two sources, which may be different parts either of the same organism, or of different organisms.

The effect of impregnation appears in all cases to be that the impregnated protoplasm tends to divide into portions (*blastomeres*), which may remain united as a single cell-aggregate, or some or all of them may become separate organisms. A longer or shorter period of rest, in many cases, intervenes between the act of impregnation and the commencement of the process of division. As a general rule, the female cell which directly receives the influence of the male, is that which undergoes division and eventual development into independent germs; but there are some plants, such as the *floridæ*, in which this is not the case. In these the protoplasmic body of the trichogyne, which unites with the molecular spermatozoids, does not undergo division itself, but transmits some influence to adjacent cells, in virtue of which they become subdivided into independent germs or spores. There is still much obscurity respecting the reproductive processes of the *infusoria;* but, in the *vorticellidæ*, it would appear that conjugation merely determines a condition of the whole organism, which gives rise to the division of the endoblast, or so-called nucleus, by which germs are thrown off; and if this be the case the process would have some analogy to what takes place in the *floridæ*. On the other hand, the process of conjugation by which two distinct *diporpæ* combine into that extraordinary double organism, the *diplozoon paradoxum*, does not directly give rise to germs, but determines the development of the sexual organs in each of the conjugated individuals; and the same process takes place in a large number of the *infusoria*, if what are supposed to be male sexual elements in them are really such. The process of impregnation in the *floridæ* is remarkably interesting from its bearing upon the changes which fecundation is known to produce upon parts of the parental organism other than the ovum, even in the highest animals and plants.

The nature of the influence exerted by the male upon the female element is unknown. No morphological distinction can be drawn between those cells which are capable of reproducing the whole organism without impregnation, and those which need it, as is obvious from what happens in insects, where eggs which ordinarily require impregnation —exceptionally, as in many moths, or regularly, as in the case of drones among bees— develop without impregnation. In fact, generation may be regarded as a particular case of cell multiplication, and impregnation simply as one of the many conditions which may determine or affect that process. In the lowest organisms, the simple protoplasmic mass divides, and each part retains all the physiological properties of the whole, and consequently constitutes a germ whence the whole body can be reproduced. In more advanced organisms each of the multitude of cells into which the embryo cell is converted at first, probably retains all, or nearly all, the physiological capabilities of the whole, and is capable of serving as a reproductive germ; but as division goes on, and many of the cells which result from division acquire special morphological and physiological properties, it seems not improbable that they, in proportion, lose their more general characteristics. In proportion, for example, as the tendency of a given cell to become a muscle cell or a cartilage cell is more marked and definite, it is readily conceivable that its primitive capacity to reproduce the whole organism should be

reduced; though it might not be altogether abolished. If this view is well based, the power of reproducing the whole organism would be limited to those cells which had acquired no special tendencies, and consequently had retained all the powers of the primitive cell in which the organism commenced its existence. The more extensively diffused such cells were, the more generally might multiplication by budding or fission take place; the more localized, the more limited would be the parts of the organism in which such a process would take place, and even where such cells occurred, their development or non-development might be connected with the conditions of nutrition. It depends on the nutriment supplied to the female larva of a bee whether it shall become a neuter or a sexually perfect female; the sexual perfection of a large proportion of the internal parasites is similarly dependent on their food; and perhaps on other conditions, such as the temperature of the medium in which they live. Thus the gradual disappearance of agamogenesis in the higher animals would be related with that increasing specialization of function which is their essential characteristic; and when it quite ceases to occur, it may be supposed that no cells are left which retain unmodified the powers of the primitive embryo cell. The organism is then like a society in which every one is so engrossed by his special business that he has neither time nor inclination to marry. Even the female elements in the highest organisms, little as they differ to all appearance from undifferentiated cells, and though they are directly derived from epithelial cells which have undergone very little modification from the condition of blastomeres, are incapable of full development unless they are subjected to the influence of the male element, which may be compared to a kind of nutriment. But it is a living nutriment, in some respects comparable to that which would be supplied to an animal kept alive by transfusion, and its molecules may transfer to the impregnated embryo cell any special characters of the organism to which it belongs.

The tendency of the germ to reproduce the characteristics of its immediate parents, combined in the case of sexual generation with the tendency to reproduce the characteristic of the male, is the source of the singular phenomena of *hereditary transmission*. No structural modification is so slight, no functional peculiarity is so insignificant, in either parent, that it may not make its appearance in the offspring. But the transmission of parental peculiarities depends greatly upon the manner in which they have been acquired. Such as have arisen naturally, and have been hereditary through many generations, tend to appear in the progeny with great force; while artificial modifications, such, for example, as result from mutilation, are rarely, if ever, transmitted. Circumcision through innumerable ancestral generations does not appear to have reduced that rite to a mere formality, as it should have done if the abbreviated prepuce had become hereditary in the Jewish people; while modern lambs are born with long tails, notwithstanding the long-continued practice of cutting those of every generation short. And it remains to be seen whether the supposed hereditary transmission of the habit of retrieving among dogs is really what at first it seems to be. On the other side, Brown-Sequard's case of the transmission of artificially induced epilepsy in guinea-pigs is undoubtedly very weighty. In many plants and animals which multiply both asexually and sexually, there is no definite relation between the agamogenetic and the gamogenetic phenomena. The organism may multiply asexually before, or after, or concurrent with the act of sexual generation. But in a great many of the lower organisms, whether animal or vegetable, the organism which results from the impregnated germ produces offspring only agamogenetically. This is *alternation of generations*, which is, strictly, an alternation of asexual with sexual generation, in which the products of the one process differ from those of the other. The hydrozoa offer a complete series of gradations between a free self-nourishing organism, through those in which it is free but unable to feed itself, to those in which the sexual elements are developed in bodies which resemble free zoöids, but are never detached, and are mere generative organs of the body on which they are developed.

In the last case, the *individual* is the total product of the development of the impregnated embryo, all the parts of which remain in material continuity with one another. The multiplication of mouths and stomachs in a *cordylophora* no more makes it an aggregation of different individuals than the multiplication of segments and legs in a centipede converts that *arthopod* into a compound animal. The *cordylophora* is a differentiation of a whole into many parts, and the use of any terminology which implies that it results from the coalescence of many parts into a whole is to be deprecated. In *cordylophora*, the generative organs are incapable of maintaining a separate existence; but in nearly all allied *hydrozoa* the unquestionable homologues of these organs become free zoöids, in many cases capable of feeding and growing, and developing sexual elements only after they have undergone considerable changes of form. Morphologically, the swarm of *medusæ* thus set free from a hydrozoon are as much organs of the latter as the multitudinous pinnules of a *comatula*, with their genital glands, are organs of the echinoderm. Morphologically, therefore, the equivalent of the individual *comatula* is the hydrozoic stock *plus* all the medusæ which proceeds from it. No doubt it sounds paradoxical to speak of a million of *aphides*, as parts of one morphological individual; but beyond the momentary shock of the paradox, no harm is done.

IV. Ætiology has for its object the ascertaining of the causes of the facts developed under the preceding heads of morphology, distribution, and physiology, by showing

that they constitute particular cases of general physical laws. It is well to say that etiology is yet in its infancy, and that no extended dissertation touching the origin of the species is here undertaken. We can only indicate the general nature of the problems to be involved, and the course of inquiry that may lead to their solution. The first question is: Have we any knowledge, and, if so, what knowledge, of the origin of living matter? Down almost to our times, the universal assumption was that living beings were produced by generation from previous living beings of the same kind; but about 200 years ago investigators began to suspect that this rule was not universally applicable, but that small and obscure organisms were produced by the fermentation of dead putrefying, certainly non-living matter, by a process which they called *spontanea* or *generatio æquivoca*, now known as *abiogenesis*. After the investigations of Redi, Spallanzi, and others, people began to doubt the applicability of the axiom "all life comes from the living" to the more complex organisms which constitute the present fauna and flora. The most ardent supporters of abiogenesis at the present time do not pretend that organisms of higher rank than the lowest *fungi* and *protozoa* are produced otherwise than by generation from pre-existing organisms. It is, however, alleged that *bacteria*, *torulæ*, and certain *fungi*, and monads are developed under conditions which render it impossible that these organisms should have proceeded directly from living matter. The experimental evidence adduced in favor of this proposition is always of one kind, and the reasoning on which the conclusion that abiogenesis occurs is based may be thus stated: 1. All living matter is killed when heated to certain degrees. 2. The contents of a certain closed vessel have been heated to such degrees. 3. Therefore, all living matter which may have been therein has been killed. *But*, living *bacteria* have appeared in such contents subsequently to their being heated; *therefore*, they have been formed abiogenetically—that is, a living being has come from non-living matter. This is perfect logic; but then its validity depends upon the absolute accuracy of the first and second propositions. Suppose we have a fluid full of active *bacteria;* what evidence have we that they are killed by the heat? Only one kind of evidence can be conclusive, and that is that the fluid has been carefully protected from outward contact, and that *bacteria* have never appeared since the heating. The other testimony, for example that which may be furnished by the cessation of motion in the *bacteria*, and such changes as microscopes allow us to observe, is merely presumptive evidence of death, but no more conclusive of death than are insensibility and paleness in a man who has swooned. But though some living beings are killed with moderate heat, and some bear a very high degree without dying, there is no ground for the assumption that *all* living matter is killed at some given temperature. There is, further, good reason for believing that the influence of temperature on life is greatly modified; first, by the nature of the medium in which the organisms to be tested are placed, and, secondly, by the length of time during which they are subjected to trial. The latest experiments leave the question as far as ever from settlement; hence it is reasoned that no experimental evidence that a liquor may be heated to certain degrees and yet subsequently give rise to living organisms, is of the least value as proof that abiogenesis has taken place; and this for two reasons: 1. There is no proof that organisms of the kind in question are dead, except their incapacity to grow and reproduce their kind. 2. Since we know that conditions may largely modify the power of resistance of such organisms to heat, it is far more probable that such conditions existed in the experiment in question than that the organisms were generated anew out of dead matter. Prof. Huxley considers not only that the kind of evidence adduced in favor of abiogenesis is logically insufficient to furnish proof of its occurrence, but also that it may be stated as a well-based induction that the more careful the investigator, and the more complete his mastery over the endless practical difficulties which surround experimentations on this subject, the more certain are his experiments to give a negative result, while the positive results are no less sure to crown the efforts of the clumsy and the careless.

A belief in abiogenesis, it is argued, is a necessary corollary from the doctrine of *evolution*. This, says Huxley, may be true of the occurrence of abiogenesis at some time; but if the present day, or any recorded epoch of geological time, be a question, the exact contrary holds good. If all living beings have been evolved from pre-existing forms of life, it is enough that a single particle of living protoplasm should once have appeared on the globe, as the result of whatever agency. In the eyes of a consistent evolutionist any further independent formation of protoplasm would be sheer waste. The production of living matter since the time of its first appearance, only by way of biogenesis, implies that the specific forms of the lower kinds of life have undergone but little change in the course of geological time, and this is said to be inconsistent with the doctrine of evolution. But, in the first place, the fact is not inconsistent with the doctrine of evolution properly understood, that doctrine being perfectly consistent with either the progression, the retrogression, or the stationary condition of any particular species for indefinite periods of time; and, secondly, if it were, it would be so much the worse for the doctrine of evolution, inasmuch as it is unquestionably true that certain even highly organized forms of life have persisted without any sensible change for very long periods. The fact is, says Huxley, that at the present moment there is not a shadow of trustworthy direct evidence that abiogenesis does take place within the period during which the existence of life on the globe is recorded. But it need hardly be pointed out that this

fact does not in the slightest degree interfere with any conclusion that may be arrived at deductively from other considerations that, at some time or other, abiogenesis must have taken place. If the hypothesis of evolution be true, living matter must have arisen from, or, at least, in place of non-living matter; for by the hypothesis, the condition of the globe was at one time such that living matter could not have existed in it, life being entirely incompatible with the gaseous state. But living matter once originated, there is no necessity for other origination, since the hypothesis postulates the unlimited, though perhaps not illimitable, modifiability of such matter.

Of the causes which have led to the origination of living matter, or the *origin of the species*, it may be said (continues Huxley) that we know absolutely nothing. But, postulating the existence of living matter endowed with that power of hereditary transmission and that tendency to vary which is found in all such matter, Mr. Darwin has declared that the interaction between living matter and surrounding conditions, which results in the survival of the fittest, is sufficient to account for the gradual evolution of plants and animals from their simplest to their most complicated forms, and for the known phenomena of morphology, physiology, and distribution. While much weight is to be conceded to the evidences for the conceivable sufficiency of the above interaction for the alleged results, its actual efficiency in the history of the case must be regarded as at present only a hypothesis.

If all living beings have come into existence by the gradual modification, through a long series of generations, of a primordial living matter, the phenomena of embryonic development ought to be explicable as particular cases of the general law of hereditary transmission. On this view, a tadpole is first a fish and then a tailed amphibian, provided with both gills and lungs, before it becomes a frog, because the frog was the last term in a series of modifications whereby some ancient fish became an urodele amphibian, and the urodele amphibian became an anurous amphibian. In fact, the development of the embryo is a recapitulation of the ancestral history of the species. If this be so, it follows that the development of any organism should furnish the key to its ancestral history; and the attempt to decipher the full pedigree of organisms from so much of the family history as is recorded in their development has given rise to a special branch of biological speculation termed *phylogeny*. In practice, however, the reconstruction of the pedigree of a group from the developmental history of its existing members is fraught with difficulties. It is highly probable that the series of developmental stages of the individual organism never presents more than an abbreviated and condensed summary of ancestral conditions; while this summary is often strangely modified by variation and adaptation to conditions; and it must be confessed that in most cases we can do little better than guess at what is genuine recapitulation of ancestral forms, and what is the effect of comparatively late adaptation. The only perfectly safe foundation for the doctrine of *evolution* (concludes Huxley) lies in the historical or, rather, archæological evidence that particular organisms have arisen by the gradual modification of their predecessors, which is furnished by fossil remains. That evidence is daily increasing in amount and in weight; and it is to be hoped that the comparison of the actual pedigree of these organisms with the phenomena of their development may furnish some criterion by which the validity of phylogenetic conclusions, deduced from the facts of embryology alone, may be satisfactorily tested. According to this statement of the case by Huxley, it would follow that the doctrine of evolution is, for the present, to be held in expectancy; and that it is possible to use concerning it terms of too positive assertion.

BION, a Greek poet, about 280 B.C., who migrated to Italy and died from poison. Some love verses and some fragments of pastorals in hexameters by him are extant.

BIOPLASMIC THEORY. See GERM-THEORY OF DISEASE.

BIORNEBORG, a seaport t. of Finland, on the gulf of Bothnia, at the mouth of the Kumo, 76 m. n.n.w. from Abo. Pop. '67, 7270. Ship-building is carried on. Timber, pitch, and tar are the principal exports.

BIOT, EDUARD CONSTANT, son of Jean Baptiste, a distinguished Chinese scholar, was b. at Paris, 2d July, 1803. He was one of the first to promote the introduction of railways in France; but his health failing, he retired from the public service, and devoted his leisure to the study of Chinese, and the history of the social organization of the Celestial empire. He died Mar., 1850. He wrote a *Dictionnaire des Villes, etc., de l'Empire Chinois* (1842), and a multitude of *Mémoires* on Chinese subjects of scientific and social interest, printed in the *Journal Asiatique*, etc. His interesting work, *De l'Abolition de l'Esclavage Ancienne en Occident* (1840), was awarded a gold medal by the institute.

BIOT, JEAN BAPTISTE, a distinguished French physicist and astronomer, was b. at Paris, 21st April, 1774. He at first entered the artillery, but forsook the service for science; and in 1800 became professor of physics in the college de France. He was made a member of the institute in 1803; and in 1804, it was solely through him that the institute voted against making Napoleon emperor. Along with Arago, he was made a member of the bureau of longitude, and (1806) sent to Spain to carry out the measuring of a degree of the meridian, preparatory to the introduction of the present French system of weights and measures. On his return, he devoted himself to physical researches and to lecturing. In 1815, the royal society of London elected him one of their 50 foreign

members. In 1817, he visited England, and went as far n. as the Shetland islands, in order to make observations along the line of the English arc of meridian, which had been extended by col. Mudge. His most valuable contributions to science are on the polarization of light; and his researches connected with ancient astronomy are also very valuable. Of his numerous writings may be mentioned *Traité Elémentaire d'Astronomie Physique*, 3 vols. (Paris, 1805); 3d ed., considerably augmented (1850), 6 vols., with vol. of plates—translated into English. *Traité de Physique*, 4 vols. (1816); *Précise de Physique*, an abridgment of the former in 2 vols. (1817), often republished: *Recueil d'Observations Géodésiques*, etc. (1821). B. also contributed many excellent biographies of scientific men to the *Biographie Universelle*. Among the most important of his later works are *Recherches sur l'ancienne Astronomie Chinoise* (1840); *Mémoire sur la Constitution de l'Atmosphere Terrestre*, in the *Connaissance des Temps* (1841); and *Etudes sur l'Astronomie Indienne* (1862). In 1849, B. was made a commander of the legion of honor, and he was also a member of most of the learned societies in Europe. He died Feb. 3, 1862.

BIPED (Lat.), *two-footed*, a term sometimes applied, as descriptive, to man, more frequently to birds, and which scarcely admits of application to any other animal except a very few species of reptiles, some of which are batrachian (see BATRACHIA and SIREN), and some saurians (see SAURIA). The two-footed saurians may be regarded as forming a link between that order and serpents, the two-footed batrachians as connecting batrachians with fishes, other characters of resemblance being in both instances associated with this.

BIPEN'NIS, a double-headed axe, the weapon which, according to ancient historians and artists, particularly distinguished those fabulous female warriors, the Amazons.

BIPONT EDITIONS, copies of the classics issued in Deux-Ponts, or Zweibrucken, in the palatinate of the Rhine, begun in 1779, and finished (in 50 vols.) at Strassburg.

BIQUADRATIC. See EQUATIONS.

BIR (ancient *Birtha*, Turkish *Bireh-jik*), a t. of from 1800 to 2000 houses of Asiatic Turkey, in the pashalic of Diarbekir. It is situated on the e. bank of the Euphrates, in lat. 37° 3′ n., long. 38° e., on a steep hill above the river, the passage of which is here commanded by a castle. B. is surrounded by a strong wall flanked with towers; its streets are narrow, but clean; it has several mosques with tall minarets, a caravansary, a bazaar, and a ruined citadel and castle. Travelers and caravans from Aleppo to Diarbekir, Bagdad, Persia, etc., cross the Euphrates at this point. From B., col. Chesney proposed to navigate the Euphrates by small steamers to its mouth in the Persian gulf, a distance of 1143 miles. B., which signifies "well," is the prefix of several other smaller towns in Arabia.

BIRCH (*bétula*), a genus of plants of the natural order *amentaceæ* (q.v.), sub-order *betulineæ*, the natural order *betulaceæ* of some botanists. In this order or sub-order—which contains only the two genera, birch and alder (q.v.)—the flowers have merely small scales for their perianth; the ovary is two-celled, but the fruit—a small achenium (q.v.)—is by abortion one-celled; the fruits and scales united form a sort of cone; and the leaves have stipules which soon fall off. They are all trees or shrubs, natives of temperate and cold regions.—The genus *betula* is distinguished by 10 to 12 stamens, and winged achenia.—The common B. (*betula alba*) has small ovato-triangular doubly serrated leaves. It is a very beautiful forest-tree, abounding in the n. of Europe and of Asia, often forming large groves by itself. In the s. of Europe, it is found only upon mountains of considerable elevation. It is a tree of rapid growth. In favorable situations, it attains the height of 60 or even 70 ft., with a diameter of 1½ or 2 ft.; whilst on the northern, or utmost alpine limits of vegetation, it only appears as a stunted bush. The bark is smooth and silvery white, and its outermost layers are thrown off as the tree advances in age. The smaller branches are very slender and flexible, and in a particularly graceful variety called the weeping B. (*B. pendula* of some botanists), they are still more slender, elongated, and pendulous. Some of the finest weeping birches in Britain stand on the banks of the river Findhorn, near Forres, in Morayshire; they are 60 ft. high, and exhibit pendent masses of spray 10 ft. in length. The bark and leaves of the B. are, in some northern countries, used medicinally in cases of fever and eruptions. They are also used for dyeing yellow. The bark is sometimes used for tanning, and is preferred to every other kind of bark for steeping nets, sails, and cordage. See BARK FOR TANNING. It is in some countries made into shoes, hats, drinking-cups, etc., and it is even twisted into a coarse kind of ropes. Portable boats made of it are used on the Volga. It is remarkable for durability. In many parts of the n. of Europe, it is used instead of slates or shingles by the peasantry; and in Russia—the outer or white layers being subjected to distillation—there is obtained a reddish empyreumatic oil called B. oil; it yields also the B. tar, or *degutt*, which is employed in the preparation of Russia leather. Dried, ground, and mixed with meal, B. bark is used in Norway for feeding swine; and, in times of scarcity, has even served for human food. The wood is in universal use in northern countries for the most various purposes. It is white, firm, and tough, and is employed by wheelwrights, coopers, turners, etc. It is very much employed in the manufacture of barrels for fish. It is much employed for smoking hams, herrings, etc., because of the flavor which it imparts. Much of it is made into

charcoal for forges. The twigs are in general use for besoms. In the highlands of Scotland, and in many other countries, the sap is not only used as a beverage in a fresh state, but is converted by fermentation into a kind of wine. To obtain it, a hole is bored in the stem, in spring, in an oblique direction, one or two inches deep, and a small tube is introduced to carry the sap into a vessel. From a strong stem, there often flows as much as from four to six quarts in a day. If the hole is again closed up each time with a wooden plug, covered over with clay or resin, and the tapping is annually renewed in the same place, the tree sustains very little injury. B. sap is very beneficial in diseases of the kidneys and in cases of urinary calculus. It contains more than 2 per cent of sugar.—The white B. of North America (*B. populifolia*) very nearly resembles the common B., but is of much less value. It is found as far s. as Pennsylvania. The wood is scarcely used.—The black B. of the same country (*B. nigra*), also sometimes called red B., and very similar to the common B., produces very hard and valuable timber. It attains the height of 70 feet. It is not found further n. than New Jersey. The bark is of a dark color, the epidermis in the younger trees reddish.—But the name black B. is also given to another species found in the more northern parts of North America, and sometimes called the sweet B. or cherry B. (*B. lenta*), also a tree of 70 ft. or upwards in height, and of which the timber is fine-grained, and valuable for making furniture, and for other purposes. Its leaves, when bruised, diffuse a sweet odor, and, when carefully dried, make an agreeable tea. It is remarkable that this tree has been little planted in Britain.—The yellow B. of North America (*B. excelsa*) is a tree of 70 to 80 ft. high, destitute of branches for 30 to 40 ft., remarkable for its large leaves, which are 3½ in. long, and for the brilliant golden yellow color of the epidermis. It is found in Nova Scotia, New Brunswick, Maine, etc. Its timber is used in ship-building. The young saplings of all these American species are much employed for making hoops for casks.—The paper B. (*B. papyracea*) is found in the northern parts of North America. It attains the height of 70 feet. The bark of the young trees is of a brilliant whiteness. The bark is capable of division into very thin sheets, which have been used as a substitute for paper. It is used by the Indians for canoes, boxes, buckets, baskets, etc. Large plates of it are curiously stitched together with the fibrous roots of the white spruce, and coated with the resin of the balm of Gilead fir. The wood is used for the same purposes with that of the common B.—The mountainous districts of India produce several species of this genus. Thin, delicate plants of the bark of *B. bhojputtra*, a native of the mountains of Kumaon, are used for lining the tubes of hookahs, and are carried in great quantities to the plains of India for this purpose. They were formerly used instead of paper for writing. *B. acuminata*, a native of the mountains of Nepaul, is a tree 50 to 60 ft. high, covered with branches from the base, and of an oval form. Its wood is strong and durable.—The dwarf B. (*B. nana*) is a mere bushy shrub, seldom more than 2 or 3 ft. high, and generally much less. It has orbicular crenate leaves. It is a native of the whole of the most northern regions of the globe, and is found in some parts of the highlands of Scotland. It is interesting because of its uses to the Laplanders and other inhabitants of very northern regions, to whom it supplies their chief fuel, and the material with which they stuff their beds. Its seeds are the food of the ptarmigan, on which the Laplanders in a considerable degree depend. A similar shrubby species (*B. antarctica*) occurs in Terra del Fuego.

BIRCH, SAMUEL, keeper of the oriental antiquities in the British museum, is a son of the late Rev. S. Birch, rector of St. Mary Woolnoth, in the city of London, and was born in London, in the year 1813. B. was educated at Merchant Taylors' school. In 1834, he entered the public service under the commissioners of public records; and in 1836, he obtained the appointment of assistant in the department of antiquities, British museum. In this capacity, B. acquired an extensive acquaintance with archæology in all its branches. He studied not only Greek and Roman antiquities, including numismatics, but applied himself with untiring zeal to Egyptian hieroglyphics. In process of time, he so distinguished himself in this difficult branch of learning, that he gained the notice of the celebrated chevalier Bunsen, who gladly availed himself of B.'s knowledge in the philological portion of *Egypt's Place in Universal History*. The chevalier, in his preface, thankfully acknowledged this assistance in the following terms: "This English edition owes many valuable remarks and additions to my learned friend, Mr. Samuel Birch, particularly in the grammatical, lexicographic, and mythological part. That I have been able to make out of the collection of Egyptian roots, printed in the German edition, a complete hieroglyphical dictionary, is owing to him. To him also belong the references to the monumental evidence for the signification of an Egyptian word, wherever the proof exhibited in Champollion's dictionary or grammar is not clear or satisfactory. . . . The work may now be said to contain the only complete Egyptian grammar and dictionary, as well as the only existing collection and interpretation of all the heiroglyphical signs; in short, all that a general scholar wants, to make himself master of the hieroglyphic system, by studying the monuments." After Bunsen's decease, B. was engaged to prepare for the press and edit the fifth and concluding volume of *Egypt's Place*, a task which he has performed in an admirable manner, giving the results of all the discoveries made by Egyptologists, since the publication of the first volume, in 1848, down to the year 1867. B. has also prepared a second edition of the first volume of *Egypt's Place*,

published at the same time as vol. 5, and in which the same care has been taken to make the work correspond with the most recent investigations of hieroglyphic scholars. It was by the particular desire of Bunsen, as expressed on his death-bed, that B. undertook the revision of his work on Egypt. B. is now universally recognized as the foremost Egyptologist in this country. In 1844, upon the retirement of Mr. Barnewell from the office of assistant-keeper in the department of antiquities, B. was appointed his successor. In 1861, upon the retirement of Mr. Hawkins from the post of keeper of the antiquities, that department was divided into three separate and independent departments, viz., the department of oriental, mediæval, and British antiquities, and ethnography; the department of Greek and Roman antiquities; and the department of coins and medals. B. was appointed keeper of the first-named collections; but afterwards, a fourth department was constituted out of these collections, viz., that of British and mediæval antiquities and ethnography, so that B. is now the keeper only of the Egyptian and oriental antiquities. In 1862, B. received the honorary degree of LL.D. from the university of St. Andrews and from Cambridge in 1874, in which year B. was president of the great London congress of orientalists. He is a corresponding member of the institute of France (académie des inscriptions et des belles-lettres); also of the academy of Berlin, of the academy of Herculaneum, and of the archæological institute of Rome. B.'s principal publications are as follow: *Gallery of Antiquities selected from the British Museum by F. Arundale and J. Bonomi, with Descriptions by S. Birch* (1842); *Views on the Nile, from Cairo to the Second Cataract, drawn on Stone, from Sketches taken by Owen Jones and J. Goury, with Historical Notices of the Monuments by S. Birch* (1843); *Catalogue of Greek and Etruscan Vases in the British Museum* (1851), drawn up in conjunction with Mr. Newton; *An Introduction to the Study of the Egyptian Hieroglyphs*, for Gardner Wilkinson's *Egyptians* (1857), and a new edition of Wilkinson's work (1879); *History of Ancient Pottery* (2 vols., 1858); *Description of the Papyrus of Nas-khem, Priest of Amen-ra, discovered in an Excavation made by direction of H.R.H. the Prince of Wales in a Tomb near Gournah at Thebes* (1863); and the *Rhind Papyri* (1866). Besides his Egyptian and classical labors, B. has also studied Chinese, and in that direction is author of the following brief contributions, viz., *Analecta Sinensia*, short stories from the Chinese (1841); *The Friends till Death*, a tale translated from the Chinese (1845); and *Chinese Romance—The Elfin Foxes* (1863). B. has likewise contributed papers to the *Archæologia*, to the *Transactions of the Royal Society of Literature*, the *Revue Archéologique*, the *Archäologische Zeitung*, and the *Zeitschrift für Aegyptische Sprache und Alterthumskunde*. He has also written many articles for the *English Encyclopædia*, principally on subjects connected with Egyptian antiquities and hieroglyphics. In the same class of subjects, he has been a much valued contributor to Chambers's *Encyclopædia*.

BIRCH, THOMAS, D.D., an industrious historical writer, son of a coffee-mill maker, a Quaker, b. at Clerkenwell, Nov. 23, 1705, was at first an usher in different schools. Having taking priests' orders in 1731, he was presented in 1732 to a living in Essex, and in 1734 became chaplain to the earl of Kilmarnock, who was beheaded in 1746. Appointed in the latter year rector of St. Margaret Pattens with St. Gabriel, Fenchurch street, London, B. was elected in 1752 one of the secretaries of the royal society, a history of which he published in 4 vols. 4to, in 1756–57. In 1761, he was preferred to the rectory of Deepdene, Surrey. His first literary undertaking, in which he was assisted by others, was *The General Dictionary, Historical and Critical*, 10 vols., 1734–41, founded on Bayle's celebrated work. He next edited the collection of state papers of Thurloe, secretary to Oliver Cromwell, 7 vols. folio, 1742. His other works are *Life of the Hon. Robert Boyle*, 1744; *Lives and Characters of the Illustrious Persons of Great Britain*, the engravings by Houbraken, Gravelot, and Vertue (London, 1743–52); *Inquiry into the Share which King Charles I. had in the Transactions of the Earl of Glamorgan*, 1747; *Historical View of the Negotiations between the Courts of England, France, and Brussels*, 1592 to 1617, 1749; *Life of Tillotson*, 1752; *Memoirs of the Reign of Queen Elizabeth*, 2 vols. 1754; *Life of Henry, Prince of Wales*, 1760; etc. He likewise edited the works of sir Walter Raleigh, Bacon's works, and various others. He was killed by a fall from his horse in the Hampstead road, 9th Jan., 1766. He left an extensive MS. collection, with his library, to the British museum, of which he was a trustee. From these MSS. were compiled *The Courts and Times of James I. and Charles I.*, 4 vols. 8vo (London, 1848).

BIRCH-PFEIFFER, CHARLOTTE, a German actress and writer of plays, was b. at Stuttgart in the year 1800. Her passion for the stage displayed itself so strongly, that after encountering much opposition on the part of her parents, she made her début at Munich at the age of 13, and afterwards played with great success at Berlin, Vienna, and Hamburg. In 1825, she married Dr. Christian Birch of Copenhagen, and afterwards performed at Petersburg, Pesth, Amsterdam, and other places. In 1837, she undertook the direction of the theatre at Zurich. At a later period, she acquired even greater renown as a writer for the stage than as an actress. Her principal theatrical pieces are *Pfefferrösel; Hinko; Die Günstlinge*, perhaps her best piece; *Der Glöckner von Notre Dame;* etc. In 1843, Madame B. resigned the direction of the Zurich theatre, and after visiting professionally most of the cities in Germany, made an engagement with the theater-royal at Berlin. The chief productions of what may be termed her later manner are—*Die Marquise von Villette* (1845), *Dorf und Stadt* (1848), *Eine Familie* (1849), *Anna von Oestrich*

(1850), *Ein Billet* (1851). In 1862 was published a complete edition of her dramatic works, which are about 70 in number, and a collection of her novels and tales. She died at Berlin, Aug. 25, 1868.

BIRD, EDWARD, an English *genre* painter of considerable celebrity, was b. at Wolverhampton in 1772. He having early displayed a strong inclination for drawing his father thought he was consulting his son's taste when he apprenticed him to a Birmingham tea-board manufacturer, his duty there being to paint flowers, shepherds, etc., on the boards. On the expiration of his apprenticeship, B. established himself as a drawing-master in Bristol; and two of his pictures, the "Choristers Rehearsing," and "The Will," having been bought by the duke of Clarence, afterwards William IV., and the marquis of Hastings, his reputation was secure. He was elected a royal academician, and soon obtained some good commissions. The "Field of Chevy Chase the Day after the Battle," is generally considered his masterpiece. His "Death of Eli" obtained the British institution prize of 300 guineas. In 1813, B. was appointed painter to the princess Charlotte. He now became ambitious to excel in Scripture subjects, and painted several, none of which, however, added to his fame. His last picture, the "Embarkation of Louis XVIII. for France," which was never finished, was the least satisfactory of all his works. He died in 1819. His most popular works are—"The Blacksmith's Shop," "The Country Auction," "The Village Politicians," "The Young Recruit," etc.

BIRD, FREDERICK MAYER, b. 1838; son of Robert; graduated at the university of Pennsylvania; minister in the Lutheran church, which he left in 1868 to join the Protestant Episcopal; taking charge of a church in New Jersey. He has paid great attention to hymnology, and edited in whole or in part the *Lutheran Hymn Book* and *Hymns of the Spirit*.

BIRD, GOLDING, 1815–54; an English physician proficient in botany; lecturer on natural philosophy and materia medica in Guy's hospital. He was author of *Elements of Natural Philosophy, being an Experimental Introduction to the Physical Sciences, Lectures on Electricity and Galvanism in their Physiological and Therapeutical Relations*, and some other works.

BIRD, ROBERT MONTGOMERY, 1803–54; b. in Delaware; practiced medicine in Philadelphia, and wrote for magazines. He wrote *The Gladiator* for Edwin Forrest, and afterwards wrote several historical romances. In his *Peter Pilgrim*, there is a careful description of the Kentucky mammoth cave. He was also for a time editor of the *North American*.

BIRD-BOLT. Stevens, in his note on *Much Ado about Nothing*, says the B. is "a short, thick arrow, without point, spreading at the extremity so much as to leave a broad flat surface, about the breadth of a shilling. Such are to this day in use to kill rooks with, and are shot from a cross-bow."

BIRD-CATCHING SPIDER, a name originally given to a large spider, *mygale avicularia*, a native of Cayenne and Surinam; but which is now more extensively applied, being equally appropriate to a number of large species of *mygale* (q.v.) and *epeira* (q.v.), perhaps also of other genera. It has indeed been denied by some observers that the name is truly appropriate, but the positive evidence is too strong to be easily set aside by evidence merely negative. The *mygale avicularia* is nearly two inches long, very hairy, and almost entirely black; its feet, when stretched out, occupy a surface of nearly a foot in diameter. The hooks of its mandibles are strong, conical, and very black. This great spider forms a tube-shaped cell, widening towards the mouth, of a fine white semi-transparent tissue, like muslin, in clefts of trees or hollows among rocks and stones. From this it issues only at night, to prey upon insects, and, it is said, upon hummingbirds. It does not construct a net for the capture of its prey, but takes it by hunting, as do other large species of *mygale*, natives of the warm parts of America, the East Indies, and Africa. It is probably a species of this genus that Dampier mentions as found in Campeachy, the fangs of which, "black as jet, smooth as glass, and, at their small end, as sharp as a thorn," are said by him to be worn by some persons in their tobacco-pouches, to pick their pipes with; and to be by others used as toothpicks, in the belief of their having power to expel the toothache. The bite of the large species of this genus is said to be dangerous.

It appears that spiders of the genus *epeira* feed upon small birds caught in their webs, which have even been described as in some cases large enough to arrest the flight of a bird the size of a thrush, and to impede the traveler in tropical forests.

BIRD-CHERRY, *Padus*, a subdivision of the genus *cerasus* (see CHERRY), itself very generally regarded as a sub-genus of *prunus* (see PLUM). The bird-cherries are distinguished by racemes of small flowers and deciduous leaves.—The COMMON B. (*prunus* or *cerasus padus*), called in Scotland *hagberry*, is a tall shrub or small tree, sometimes reaching the height of 40 ft., growing wild in moist woods in Britain, and in most parts of Europe and the n. of Asia. Its younger branches are of a very dark or reddish-brown color. The drupes are small, of a sweetish subacid taste, combined with a degree of what many regard as nauseous bitterness; but to some palates they are not disagreeable. A well flavored spirituous liquor is prepared from them in the n. of Europe. In Siberia, the juice expressed from the ripe fruit is drunk either alone or mixed with milk, and the

remaining mass is kneaded into cakes, and used as food.—Very nearly allied to this species is the VIRGINIAN B. (*P.* or *C. Virginiana*), a tree of 80 to 100 ft. in height, found from Tennessee to Upper Canada, and now frequent in Britain as an ornamental tree, although never attaining the size which it does in the United States. The wood is compact, fine-grained, takes a fine polish, and is much used in America by cabinet-makers. The bark is used in the United States as a febrifuge. The fruit is not agreeable; but a cordial is made from it by infusion in spirits with sugar, and, when dried and bruised, it forms an esteemed addition to *pemmican* (q.v.).

BIRDE, WILLIAM, a distinguished ecclesiastical composer, was b. about the year 1540, and educated at Edward VI.'s chapel. In 1563, he was appointed organist in Lincoln cathedral, and twelve years afterwards organist to queen Elizabeth. He published numerous compositions exhibiting great musical learning, and contributed many pieces to queen Elizabeth's *Virginal Book;* but his fame rests on the canon *Non Nobis Domine,* which, amid all changes in musical taste, has retained its popularity, and still continues to challenge admiration. B. died in 1623.

BIRD ISLAND, the n.w. island of the Sandwich archipelago, in lat. 23° 20′ n., and long. 160° w. It is, as its name implies, a mere haunt of sea-fowl—the links of the chain increasing pretty regularly in size and elevation from B. I. on the n.w. to Hawaii on the s.e.

BIRD-LIME is a viscid and adhesive substance, which is placed on twigs of trees or wire-netting, for the purpose of catching the birds which may alight thereon. A common practice is to place a decoy or tame bird in a cage near where the B. is spread; the wild birds, attracted to the spot by the song of the tame bird, get entangled with the bird-lime. The substance is generally prepared from the middle bark of the holly, mistletoe, or distaff-thistle, by chopping up the bark, treating it with water, boiling for several hours, then straining; and lastly, concentrating the liquid by evaporation, when the B. assumes a gelatinous consistence resembling that of moist putty. It mainly consists of a substance named by the chemist *viscin.* A second mode of preparing B., is to employ ordinary wheat-flour; place it in a piece of cotton cloth; tie up the ends, so as to form a bag; immerse the whole in a basin of water, or allow a stream of water to flow upon it; and repeatedly squeeze the bag and its contents. The result is, that the starch of the wheat-flour is pressed out of the cloth bag, and an adhesive substance named *gluten* is left on the cloth. This substance resembles that prepared by the previous process in its properties; but the former mode of preparing B. is a much cheaper plan, and is that generally followed.

BIRD OF PARADISE, the common name of the family of birds, *paradiseidæ* of ornithologists, found chiefly in New Guinea and neighboring islnds, and remarkable for splendor of plumage. In all other respects, however, they are very closely allied to the crow-family, *corvidæ* (q.v.), to which they exhibit a great similarity, not only in the characters of the bill, feet, etc., and in general form, but also in their habits, and even in their voice. They have been the subject of many fables. The state in which their skins are usually exported from their native islands, gave rise to the notion that they were destitute of feet; and free scope being allowed to fancy, it became the prevalent belief that they spent their whole lives floating in the air, except when perhaps they suspended themselves for a little by their long tail-filaments from the uppermost branches of trees. As for their food, it was supposed to be either mere dew and vapors, or nectar obtained from the flowers of trees, climbers, and plants growing on the branches of trees, in the high regions of bright sunshine above the shade of the tropical forests. Antony Pigafetta, indeed, who accompanied Magellan in his voyage round the world, described them as having legs, and stated that these were cut off as useless in the preparation of the skins; but his statement was not credited, and Aldrovandus went the length of accusing him of an audacious falsehood. It would seem that the fables concerning the birds of P. are in part to be ascribed to the desire of the inhabitants of those islands in which they are found to increase the value of their skins as an article of merchandise; and a sort of sacred character being attached to them, they were employed not merely for ornament, but as a charm to secure the life of the wearer against the dangers of battle. The people of Ternate call them *Manuco-Dewata,* or birds of God; which name Buffon modified into *manucode.* In different languages they are known by names signifying birds of the air, birds of the sun, etc.

The males alone are birds of splendid plumage, that of the females possessing neither brilliancy of colors nor remarkable development. The plumage of the males is not only characterized by great brightness of tints, but by a glossy velvety appearance, a metallic luster, and a singularly beautiful play of colors. Tufts of feathers generally grow from the shoulders, and these, in some of the kinds, are prolonged so as to cover the wings; in the species sometimes called the common B. of P., and sometimes the great emerald B. of P. (*paradisea apoda*), the prolongation of these shoulder tufts is so great that they extend far beyond the body, and even far beyond the tail. They constitute the magnificent part of the well-known B. of P. plumes. They are exquisitely light and delicate. It has been supposed that they may be of use to the creature in enabling it, with less exertion of wing, to float in the air, but this notion is perhaps sufficiently confuted by the total absence of them in the female.—In other species, there

are elongated feathers on the back of the neck, which the bird can erect, and even in some measure throw forward at pleasure; and these, in the genus *lophorina*, assume a form resembling that of a pair of outspread wings, and rise far above the head. The tail is, in general, not unlike that of a crow in its shape; but in many species there arise, from the rump, at the sides of the tail, two very long feathers, or rather filaments, covered with a sort of velvety down: of these, the common B. of P. affords an example. In the king B. of P. (*cincinnurus regius*), these long tail-filaments terminate in a sort of disk, as the tail-feathers of the peacock do.

Birds of P. are, in general, more or less gregarious. They sometimes pass in flocks from one island to another, according to the change of seasons, from the dry to the wet monsoon. Owing to their plumage, they fly more easily against than with the wind, and by high winds they are sometimes thrown to the ground. They are lively and active, and in confinement pert and bold. They bestow great care upon their plumage, and sit always upon the perches of the cage, so that no part of it may reach the floor, or get in the least degree soiled. It has seldom been found possible to bring them alive to Europe, and they seem very incapable of enduring any other than a tropical climate. In confinement, they are easily fed on rice, insects, etc. In a wild state, their food consists in great part of the fruit of the teak-tree, and of different species of fig, and also of the large butterflies which abound in their native islands.

The Papuans kill birds of P. by shooting them with arrows, and employ various other means of taking them for the sake of their skins. The skins are dried in smoke, and fumigated with sulphur, to preserve them from insects; and in this way the brilliancy of the color is impaired, so that the most gorgeous plumes which are ever seen in Europe are inferior, in this respect, to those of the living bird. The skin, to which great part of the flesh is allowed to remain attached, is always much contracted by this drying process, and a very erroneous notion is therefore often formed of the size of the bird. The common B. of P. is as large as a jay. It is of a cinnamon color, the upper part of the head and neck yellow, the front and throat emerald green, the shoulder-tufts yellow. The whole length of the extremity of these is not less than two feet. Another nearly allied species (*Paradisea rubra*) has these long feathers of a brilliant carmine color.

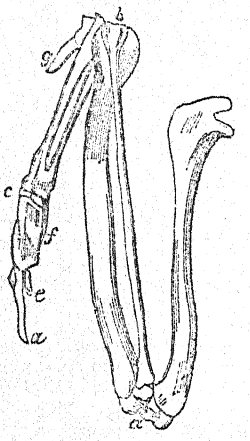
BIRDS (*Aves*), the second class of vertebrated (q.v.) animals, and the first of oviparous veterbrated animals, including all the oviparous animals which have warm blood. B. exhibit great similarity in their general structure, and are sharply distinguished from all other classes of animals. To this class belong all animals, except bats (q.v.) alone, which have an internal skeleton, and are capable of true flight. The anterior extremities of B. serve them only as wings or organs of flight, and never in any degree as arms or legs; those few birds in which the wings are too small to raise the body in the air, generally employ them to aid their swift running upon land, as the ostrich, or for swimming under water, as the great auk and the penguins. The body is covered with feathers (q.v.), and this is one of the characters in which all birds agree, and by which they are distinguished from all other animals. The general form is adapted to motion through the air, and the trunk is compact, and somewhat boat-shaped. The vertebral column possesses little flexibility; indeed, the vertebræ of the back generally become ankylosed or firmly united together by cementing bone, the solidity which is thus acquired being of evident use for the support of the ribs, and these also are proportionately stronger than is usual in quadrupeds; each of them is provided in the middle with a flattened bony process, directed obliquely backwarks to the next rib, so that they support one another, whilst instead of being united to the sternum, or breast-bone, by cartilages, as in quadrupeds, they are continued to it in the form of bone; all these things combining to give strength to that part of the body in which it is particularly needed, both in order to the powerful action of the wings, and the perfect freedom of respiration during flight. In those birds, however, which do not fly, the vertebræ of the back retain some power of motion. Ths hinder part of the vertebral column exhibits a solidity even greater than the anterior part of it, the lumbar vertebræ (q.v.) being consolidated into one piece with the pelvis (q.v.), which furnishes attachment to strong muscles for support of the trunk upon the legs, and for the motion of these organs. The vertebral column, however, terminates in a number of small movable (*coccygeal*) vertebræ, the flexibility of this part being necessary to the motion of the tail, which is itself supported by a short and generally much elevated bone, regarded as consisting of ankylosed vertebræ, called the rump-bone, or, from its peculiar form, the plowshare-bone.

In contrast to the general stiffness of the vertebral column in the trunk, it is remarkable for great flexibility in the neck, enabling a bird to make ready use of its bill, or to bring its head into such position as suit the adjustment of the center of gravity in flying, standing, etc.

The number of vertebræ in the neck varies from ten to twenty-three, the smallest number being greater than is found in any quadruped. The head, also, is so articulated to the neck, by a single *condyle*, or pivot, that a bird can turn its head round in a manner impossible to the mammalia. The skull itself is formed of bones corresponding with those of man and quadrupeds; but they can only be distinguished when the bird is very young, soon becoming consolidated together. The jaws are much elongated, so as to form the bill, the organ chiefly employed in seizing food, as well as for fighting, nest-

building, dressing or preening the feathers, and instead of a *hand* for every purpose which bird-life requires. The upper mandible of the bill is so connected, however, with the bone of the skull, by elastic plates, that it possesses some power of motion, and any shock which it may receive is much deadened before reaching the skull. The bill affords many of the most important distinctive characters of B., differing very much according to the mode of life of different orders and tribes. See BILL.

The sternum or breast-bone in B. is remarkably large and strong, serving for the attachment of the powerful muscles which depress the wings, and receives great attention from naturalists, because its variations correspond with the differences in some of the most important characters and habits of birds. It generally exhibits a projecting ridge along the middle, which is proportionately largest in birds of most powerful flight, and is wanting only in ostriches and a few other birds of allied genera which do not fly. The clavicles or collar-bones, also, are generally united to form the fourchette (*furcula*) or merry-thought bone, serving, along with two bones called the coracoid bones, to keep the shoulders separated, and to resist the compressing tendency of the action of the wings. The bones of the wing itself are regarded as corresponding to those of the anterior extremities in man and quadrupeds; the bones of the hand, however, being much disguised, and some of them wanting or rudimentary. In the accompanying cut of the bones of a bird's wing, *a* is regarded as the elbow-joint, *b* as the wrist-joint, *c* as the knuckle-joint, *d* being the representative of a finger, *e* and *f* the rudimentary representatives of two others, whilst the *winglet*, *g*, formerly regarded as representing the thumb, is now rather supposed to be homologous to the forefinger. The wings, therefore, exhibit a structure entirely different from those of bats, in which the fingers are extremely elongated. The surface necessary for striking the air is provided by feathers larger and stronger than those of other parts of the body, called *wing-feathers*, *quill-feathers*, or *quills*. Of these, which exhibit an admirable combination of strength with lightness and elasticity, some spring from the part of the wing between *b* and *d* (in the figure of the bones of the wing); these are always the largest, and are called the *primary* wing-feathers, or simply *primaries;* those which spring from the part between *a* and *b* are called *secondaries;* and those which spring from the part between *a* and the shoulder-joint are called *tertiaries*. At the base of the quills, on both sides of the wing, are feathers called *wing-coverts*, and these are likewise distinguished as primary, secondary, etc.. The feathers which grow over the shoulder-blades are called *scapulars*. The feathers of the wings vary in length and strength, according to the mode of life and power of flight in different B.; narrow, sharp, and stiff wings being indicative of swift and enduring flight. The tail-feathers serve the purpose of a rudder to guide the bird, and also that of balancing it in the air; they resemble in character the quills of the wings. They are also furnished with *coverts* above and below. Some B. have the tail rounded at the extremity; in some, it is square; in others, notched or forked. In many land B., the tail exhibits ornamental plumes, and remarkable developments of the plumage take place also in other parts of the body, in the form of crests, ruffs, shoulder-tufts, etc.



Skeleton of bird's wing.

The legs of B consist of parts corresponding to those found in man and quadrupeds; but the thigh is short, and so concealed within the body, that it is not apparent as an external portion of the limb; the next division, often mistaken for the thigh, being the leg strictly so called, or *tibia*, which ends at what is really the heel-joint, although popularly regarded as the knee; and beneath this is the shank or *tarsus*, which in some B. is very long, serving as a part not of the foot but of the leg, and formed by a single bone which represents both the tarsus and metatarsus. The feet are divided into toes, which are generally four in number, three before and one behind, differing from each other in length and in the number of joints or phalanges of which they are composed, the toe, which is directed backward, being in general comparatively short, and consisting only of two joints. A fifth toe or tarsal spur is found in some of the gallinaceous B.; and in some B., as bustards, the hind-toe is wanting; the ostrich has only two toes, both directed forward, with the obscure rudiment of a third; and numerous B. classed together in the order of climbers (q.v.) or yoke-footed B., including parrots, cuckoos, woodpeckers, etc., have two toes before, opposed by two toes behind, the foot being thus particularly adapted for grasping, so that parrots, as is well known, even use it as a hand.—The feet of B. vary considerably according to their mode of life; and naturalists therefore depend very much upon them in classification. In some the claws are strong and hooked; in others short, straight, and weak: in some the toes are all separate, in others more or less connected: in B. specially adapted for swimming, they are generally *webbed* or united by a membrane; in other swimming-B., however, a membrane only extends along the sides of each toe. In most B. the tarsus is feathered to

the heel-joint; in some, however, and particulary in *waders*, the lower part of it is bare; the shank and toes are generally, although not always, destitute of feathers, and are covered with a scaly skin. Almost the only other parts of a bird often destitute of feathers, are the *cere* at the base of the bill, and the combs and wattles of gallinaceous birds.

In order to flight, it is indispensable that the center of gravity of a bird should be under the shoulders; and when a bird stands, the feet are brought forward, and the head thrown back, so that the claws project beyond a vertical line passing through the center of gravity of the whole body. This is generally accomplished so that the trunk is in an almost horizontal position, the fore-part only a little elevated; but in some B., which have a short neck and short legs, an erect attitude is necessarily assumed, so that the penguins of the southern seas present to navigators a somewhat ludicrous resemblance to regiments of soldiers on the beach. B., when they sleep, very generally place their head under their wing, and some of them also stand upon one foot, their equilibrium being thus more easily maintained. A remarkable contrivance, particularly to be observed in storks and other long-legged B., renders this posture unfatiguing; a locking of the bone of one part of the limb into a sort of socket in the bone of the part above it, so that it retains its place without muscular exertion; whilst a similar purpose is served by the tendons of the muscles which bend the claws passing over the joints of the leg in such a manner as to be stretched by the mere pressure there when the weight of the bird rests upon the legs, so that without any effort the claws retain a firm hold of the branch upon which it is perched.—Flying is accomplished by the action of the wings upon the elastic and resisting air; the muscles by which the stroke of the wing is given are powerful, those by which it is retracted are comparatively weak. Owing to the manner in which the first strokes of the wing must be given, few B. rise with facility from a level surface; and some of them, as swallows, and particularly swifts, rise from a perfectly level surface with great difficulty, and comparatively seldom alight where they cannot find an elevation from which, as it were, to throw themselves.

The digestive apparatus of B. resembles that of mammalia; exhibiting, however, various modifications, according to the different kinds of food—some B. feeding on flesh, others on fish, others exclusively on insects, others on seeds, others more indiscriminately on a variety of animal and vegetable substances. Few B. masticate their food in any degree, although parrots do; upon being swallowed, it enters the *crop* or *craw*, sometimes called the first stomach, an enlargement of a œsophagus or gullet, situated just before the breast-bone, and here it is moistened by a secretion, which is also by some B.—particularly by pigeons—employed as the first food for their young, the glands of the crop enlarging very much, so as to produce it in large quantity at the time when it is wanted for that purpose. The crop is wanting in the ostrich, and also generally in B. that feed on fish; and is of greatest size in those of which the food consists of seeds or grain. It is generally single, and on one side of the gullet; sometimes, as in pigeons, it is double. A second stomach, or dilatation of the œsophagus, called the *proventriculus* or *ventriculus succenturiatus*, is generally largest in those B. in which the crop is wanting or small; and in this the food is further softened and changed by a secretion which is mixed with it. The third and principal stomach is the *gizzard*, which in B. of prey, fish-eating B., etc., is a mere membranous sac; but in B. which feed on grain or seeds is very thick and muscular, so that it acts as a sort of mill, and with extraordinary power. In these B., also, a remarkable provision is made for the perfect grinding down of the contents of the gizzard, by the instinct which leads them to swallow small rough pebbles or grains of sand, an instinct well exemplified in the common domestic fowl.—The liver of B. is, in general, very large. The kidneys are large, but there is no urinary bladder, and the urine is at once poured into the *cloaca*, an enlargement of the intestine, at its termination, with which also the organs of generation communicate in both sexes.

The respiration of B. is very perfect, and their blood is from 12° to 16° warmer than that of mammalia; its circulation more rapid, and the energy of all the vital processes proportionally great. B., consequently, exhibit great liveliness; and upon the admirable provision for the aëration of their blood they depend also for their powers of flight, which enable some of them to travel hundreds of miles with great rapidity and without exhaustion, whilst others soar to a prodigious height in the air. The heart resembles that of the mammalia in its form and structure; but the right ventricle, instead of a mere membranous valve, is furnished with a strong muscle, to impel the blood with greater force into the lungs. The lungs are small, and communicate with large air-cells (q.v.) in the cavities of the body, and even in the bones, so that the aëration of the blood takes place not only in the lungs but during its circulation through the body. An extraordinary proof of the use of these air-cells in respiration was afforded in a recorded instance of a large sea-fowl, which, when an attempt was made to strangle it, was kept alive by the air entering in a forcible current through a broken wing-bone (Gosse, *The Ocean*, quoting Bennett's *Whaling Voyage*.) B. consume much more oxygen in proportion to their size than quadrupeds.

The organs of the senses are similar to those of mammalia. In the senses of touch and taste, it is generally supposed that there is an inferior development, although parrots appear to possess the sense of taste in considerable perfection; and the bills of some B., which search among the mud for their food, are certainly very delicate organs of

touch. But the sight is remarkably keen, and the eye possesses great powers of accommodation to different distances. B. perceive even small objects distinctly, at distances at which they would be quite indistinguishable to the human eye, and thus are enabled to seek their food. B. of prey also appear to possess in great perfection the sense of smell. The nostrils of all B. open on the upper surface of the bill. Hearing is acute in B., and particularly in nocturnal B., although the organs of this sense are less complicated than in mammalia, and there is seldom any vestige of an external ear. Singing-B. are extremely sensitive to differences of pitch. The voice and musical powers depend upon the conformation of the windpipe and larynx, which differs very much in different birds.

Reproduction takes place by eggs (see REPRODUCTION and EGG), which are hatched after they have passed from the body of the mother. B. generally sit upon their eggs, their bodies supplying the warmth necessary to hatch them (see INCUBATION); and this office is usually undertaken by the female alone, but sometimes is shared by the male. In very warm climates, the ostrich leaves her eggs to be hatched by the heat of the sun, but in colder climates sits upon them. A very few B., as the cuckoo, deposit their eggs in the nests of other B., to be hatched by them. Some B. construct no nest, but lay their eggs on the bare rock, as many sea-fowl do, or in holes rudely scratched in the earth or sand; many, however, show in the construction of their nests the most admirable instincts. See NESTS. The number of eggs varies, in a state of nature, from 1 to about 20, being generally smallest in the larger B., and particularly in B. of prey. B. generally breed only once a year, but some B. twice. The care which B. take of their young is as admirable as the ingenuity which they display in nest-building, and more universal. Some B. are able to run about, and pick up food as soon as they leave the shell; others remain in the nest for days, or even weeks, and must be supplied with food by their parents. Many species are social, particularly at the breeding-season, and form large settlements, which they guard in common; and some even unite in the construction of large nests, which belong to a whole community. The rapacious B., and particularly the larger ones, are very solitary in their manner of life.

B. change their feathers (*molt*), in general, once a year, and the colors of the plumage in many cases vary much in summer and winter. The change of color, however, often takes place without change of feathers, and in B. which molt both in spring and autumn, the autumn molting is much more complete than that of spring. The gayest plumage of many B. is assumed at the breeding-season, with which, also, the song of B. is connected. See SONG OF BIRDS. The plumage of the male is, in general, more gay than that of the female, all the young at first resembling the female in plumage. The plumage usually characteristic of the male is occasionally assumed by the female, and most frequently by females which have become unfit for the ordinary functions of their sex.

The brain in B. differs in some important respects from that of mammalia (see BRAIN), presenting resemblances to the brain of reptiles and fishes; but it is of large size, often larger than even in quadrupeds. The manifestation of intelligence is not, however, usually so great in B. as in quadrupeds. Their nest-building, their migrations (see BIRDS OF PASSAGE), and many other things of greatest interest, must be ascribed to instinct.

In the geographical distribution of B., the limits of species are not so exactly circumscribed by mountains, seas, and rivers as in other classes of animals, their powers of flight enabling them to pass over these obstacles. Yet some species, and even groups, are found exclusively in certain regions: thus humming-birds are all American, penguins are found only in the southern seas, and B. of paradise are confined to New Guinea and the neighboring islands. See SPECIES.

The free movements of B. through seemingly boundless space, the joyous song of many, and the characteristic tones of all—their brilliant colors, their lively manners, and their wonderful instincts—have from the earliest ages made a strong impression on men's minds, and in the infancy of intellect gave rise to many peculiar and mysterious associations with this class of creatures. Hence the flight of B. was made the foundation of a particular art of divination. See AUGURIES and AUSPICES. Religion borrowed many of its symbols from them, and poetry many of its ornaments.

In an economical point of view, B. are very important. The flesh and eggs of almost all B. may be eaten, although those of B. of prey and of fish-eating B. are generally reckoned unpleasant. Their feathers are employed for various purposes of use and ornament; their dung is valuable for manure, and guano (q.v.) is nothing else than the accumulated dung of sea-fowls. Many B. are extremely useful in preventing the multiplication of insects and worms, and compensate in this way for the mischief which they occasionally do in fields and gardens. Domestic poultry are a source of considerable profit, upon account of their eggs, flesh, and feathers. See POULTRY. Some kinds of B. of prey have been tamed, and trained to the use of the sportsman. See FALCONRY.

About 5000 existing species of B. are known. As to their systematic arrangement, see ORNITHOLOGY.

The order of B. presents in the dodo (q.v.) a remarkable and well-ascertained instance of the recent extinction of a species, and even of a genus. It is also a remarkable and

interesting fact that the greater part of the remains of extinct B. hitherto discovered are those of land-birds destitute of the power of flight, like the dodo, and the still existing ostrich, cassowary emu, and apteryx. A particular interest is attached to those of the gigantic *dinornis* (q.v.) of New Zealand. See next article.

BIRDS, Fossil. While the animal and vegetable kingdoms of the paleontologist extend to as wide, or rather a wider, range than those of the historian of modern life, yet several divisions are scantily represented in the petrified remains preserved in the stony records of the earth's crust. This was to be expected from the conditions under which these fossiliferous strata were deposited. As these rocks are aqueous, chiefly marine, the relics of plants and animals whose natural habitats were in or near the water, must be common in a fossil state, whilst the remains of others with different habits will be comparatively rare, if present at all. Birds belong to this latter class. Their power of flight would save them from numerous casualties which would prove fatal to quadrupeds; and even if they did perish in water, the lightness of their bodies, produced by their internal cavities and the quantity of their feathers, would keep them floating until they decomposed, or became the food of predaceous animals.

The earliest traces of birds consist of footprints on red argillaceous sandstones in the valley of Connecticut river, North America. These sandstones, though long considered of a much older date, have been, on the best evidence, referred by the brothers Rogers to the oolitic period. The beds had formed an ancient sea-beach, and over it, during the recession of the tide, had marched the animals, which have left on them their footsteps. Before the return of the tide, the inequalities had been filled up with dry air-drifted sand and mud, and on this was deposited a new layer of silt. The beds often exhibit ripple-marks, and occasionally small circular depressions, which have been formed by drops of rain. The traces of thirty-three species of B. have been distinguished; with them are associated the impressions of various lizards, chelonians, and batrachians. The size of the ornithichnites (Gr. *ornis*, a bird, and *ichnon* a trace or footprint), as the bird-tracks are called, so far exceed those that would be made by the largest living birds, that it was doubted whether their origin had been satisfactorily explained, until the discovery, in New Zealand, of the remains of the *dinornis*. In one species the imprint of the foot measures 15 in. in length, and 10 in. in breadth, excluding the hind claw, which is 2 in. long. The distance of the impressions from each other varies from 4 to 6 feet. These measurements indicate a bird about four times the size of an ostrich, but probably not much larger than some species of *dinornis*. The footprints are for the most part trifid, and show the same number of joints as exist in the living tridactylous birds.

No indications of the existence of birds have been discovered in the rocks of the cretaceous period. It does not follow, however, that the class *aves* had no representatives during the ages when the chalk was being deposited. This is a deep-sea formation, and for the reasons already stated, it is not to be expected that the remains of this class should be found in these measures. And so also it would be rash to conclude that the oolitic footprints give the date of the first appearance of B. on the globe. The bone of *cimoliornis diomedeus*, found in the chalk, which was described by prof. Owen as part of the humerus of a bird, is now believed to belong to a pterodactyle.

No true fossil remains of B. have been discovered in rocks older than the eocene-gypseous deposits of Montmartre, where ten species have been found. Seven species have been described from strata of the miocene period, the most important of which have been found in the Sewalik beds, associated with the remains of huge proboscidea. But the pleistocene deposits have supplied more than half of the known fossil birds. The most remarkable of these are the bones of huge struthious B. of the genera dinornis (q.v.), palapteryx (q.v.), and aptornis. Dr. Mantell mentions the fossil eggs and bones of a bird still larger, called the æpyornis, from Madagascar.

BIRD'S-EYE LIMESTONE is a division of the Trenton group of the lower Silurians of North America, apparently equivalent to the Llandeilo flags, and containing, besides the remains of brachiopods, many enormous orthoceratites.

BIRD'S-EYE VIEW is a term applied generally to modes of perspective in which the eye is supposed to look down upon the objects from a considerable height. If the eye is considered as looking perpendicularly down while it sweeps over each point of the scene in succession, we have an exact ground-plan; no object covers another, horizontal angles and distances are exactly represented; while, on the other hand, no vertical angles or side-views appear. In sketching or drawing a locality for military or economical purposes, this kind of perspective is always used. The great difficulty is to represent at the same time the relative heights of mountains and steepness of acclivities. But the more usual kind of bird's-eye views differ from common perspective only in the horizontal line being placed considerably above the picture. In the 16th c. the only kind of views known were of the nature of ground-plans, and the artists of the 17th c. tried to combine this method with side views.

BIRD'S FOOT, *Ornithopus*, a genus of plants of the natural order *leguminosæ*, suborder *papilionaceæ*, deriving both its popular and its botanical name from the resemblance of the curved pods to birds' claws; the leaves are pinnate, with a terminal leaflet. One species (*O. perpusillus*) is a native of Britain, growing on dry, sandy, or gravelly soils—a

small plant of little importance, the flowers of which are white, striated with red. But *O. sativus*, an annual growing to the height of 2 or 3 ft., a native of Portugal, is cultivated in that country as green food for cattle, and is very succulent and nutricious. Like its British congener, it grows well on very poor soils. Its Portuguese name is serradilla.

BIRD'S FOOT TREFOIL, *Lotus*, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*. The pods are cylindrical, somewhat spongy within and imperfectly divided into many cells. The name B. F. T. is derived from the resemblance of the clusters of pods to a bird's foot. It has received the name *lotus* from botanists, because a species of this genus is supposed to have been one of the plants so named by the Greeks. See LOTUS. The species, which are pretty numerous, are natives of the temperate and colder regions of the old word. The COMMON B. F. T. (*L. corniculatus*) is very abundant everywhere in Britain in pastures. It has a stem 6 to 12 in. in length, decumbent, and bearing umbellate heads of 8 to 10 yellow flowers, which have a rich honey-like smell. The leaves have three obovate leaflets, like those of the true trefoils or clovers, but at the base of each leaf-stalk there are also two large leaf-like ovate stipules. The plant is by some regarded as the shamrock (q.v.) of Ireland. It is eaten with great avidity by cattle, and its deeply penetrating roots adapt it well for very dry situations.—A larger species, otherwise very similar, by many regarded as merely a more luxuriant variety of this, with stem nearly erect, more compact heads of smaller flowers, and much smaller seeds, is the GREATER or NARROW-LEAVED B. F. T. (*L. major*), which also is a common native of Britain, generally found in moist, bushy places. The characteristic differences remain under cultivation in every variety of soil and situation. A species called the winged pea (*L. tetragonolobus*), remarkable for four membranous wings which run along its pods, a native of the s. of Europe, is frequently cultivated in gardens in Britain amongst other annual flowers; but in some parts of Europe it is cultivated for its seeds, which are used as a substitute for coffee.

BIRD'S NEST, EDIBLE, that of a sea-swallow, *hirundo esculenta*, of the Chinese coast and adjacent islands; made of glutinous vegetable matter gathered from coral or other rocks, swallowed by the bird, and thrown up when wanted for use. A nest is a little larger than a common tea-cup, and when new is white and at its best value, growing less valuable as it is used. The nests are in sea-caverns and the most inaccessible places, so that to get at them men are lowered by ropes over fearful precipices. The nest is used for food only by the Chinese, who take the whole supply, perhaps 25 tons annually, at prices ranging from $5 to $35 per pound. Its aphrodisiac qualities are the reason of its value with the celestials.

BIRDS OF PASSAGE are those birds which spend one part of the year in one country or climate and another part in another, migrating according to the season. No species of bird is known to hibernate (see HIBERNATION); and although many naturalists were at one time inclined to believe in the hibernation of swallows, this opinion has been entirely relinquished, and their annual migrations are fully ascertained. Birds avail themselves of their powers of wing to seek situations adapted for them in respect of temperature and supply of food, and even within the tropics there are birds which migrate as the seasons change from wet to dry, or from dry to wet. See BIRD OF PARADISE. The migration of birds, however, is more generally from n. to s., or from s. to n., in the temperate and colder regions of the globe, as winter passes into summer, or summer into winter; and B. of P. are commonly distinguished into summer B. of P. and winter B. of P., as they are summer or winter visitants; but, of course, those which are summer B. of P. in one country are winter B. of P. in another. They breed in the country in which they are summer B. of P. The arrival of summer B. of P. is always among the welcome signs of advancing spring, and is associated with all that is cheerful and delightful. In winter, flocks of swans, geese, and other water-fowl seek the British coasts and inland lakes and marshes from the frozen north; and at the same time, wood cocks, fieldfares, redwings, and many other birds which breed in more northern regions, regularly appear. Some birds come almost at the same date annually; others are more influenced by the character of the season, as mild or severe. Many sea-fowl are migratory, and the inhabitants of St. Kilda and other isles, to whom they are of the greatest importance, depend with confidence upon their return almost at a particular day. The migrations of pigeons in North America are extraordinary, from the vast numbers of which the migrating flocks consist. See PIGEON. The whole subject of the migration of birds is one of great interest, particularly in reference to the instinct by which they appear to be guided. Birds of migratory species, which have been reared in confinement, become restless when the season for migration arrives, and in many species the migration seems to be little influenced by the state of the weather. It would seem that the youngest swallows are left behind, to follow the first migrating hosts of their species. The number of B. of P. is very considerable, nor are they all or mostly birds of long wing and powerful flight, but many short-winged birds are included among them. Some B. of P., as woodcocks, have, however, been found in a very exhausted state after their arrival; and it is to be considered that, both in the old and new world, distant migrations are possible without long flights. Some birds possess such powers of wing, that they may easily pass over wide seas; and the rapidity of the flight of birds—from

50 to 150 m. an hour—partly explains the possibility of their migrations between distant parts of the world. It is believed that B. of P. habitually return to the same localities which they have inhabited in former years, and this seems to have been sufficiently established by proof, at least in regard to swallows.

BIRDS OF PREY, a common English appellation of the order of birds called *accipitres* (q.v.) by Linnæus. Some birds, however, which do not belong to this order, frequently pursue and prey upon other birds. If those which make fishes, insects, and worms their food, were also reckoned, great part of the whole class of birds must be considered predaceous. B. of P. are very commonly divided into two sections—*Diurnal* and *Nocturnal;* the latter consisting exclusively of owls.

BIRIOU'TCHÉ, or BIRIU'TCH, a t. in the government of Voronej, Russia, on the left bank of the Sosna, a tributary of the Don. It is surrounded with earthen ramparts and a ditch, and has four annual fairs. Pop. '67, 3062. A stream of the same name in its immediate vicinity is noted for its pearl-oysters; and the teeth of elephants are often found exposed on its banks.

BIRKBECK, GEORGE, M.D., distinguished for the leading part he took in founding mechanics' institutions, and in the education of the working-classes, was b. at Settle, in Yorkshire, Jan. 10, 1776. He commenced his medical studies at Leeds, and pursued them at Edinburgh, where he made the acquaintance, among others, of Sydney Smith, Brougham, Jeffrey, and Horner. Appointed to the chair of the Andersonian institution in Glasgow, he delivered his first course of lectures on natural and experimental philosophy in the winter of 1799. He took a leading part, along with Brougham and others, in the formation of the London mechanics' institution—the first of its kind in the kingdom—and was chosen its president for life. He died in London, Dec. 1, 1841.

BIRKENFELD, a principality of Oldenburg, adjoining the Rhenish district of Coblentz and Treves; 194 sq.m.; pop. '71, 36,128. It is a mountainous region covered with forests, and has mines of iron. In 1802, France had possession, Prussia in 1815, and it was ceded in 1817 to Oldenburg. Chief town, Birkenfeld; pop. 2249.

BIRKENHEAD, a market t., sea-port, and parliamentary borough in the parish of Bidston, and hundred and union of Wirral, Cheshire, lies opposite Liverpool, on the left bank of the Mersey. The parliamentary borough, which was constituted in 1861, when one of the seats rendered vacant by the disfranchisement of Sudbury and St. Albans was assigned to it, includes, besides the chapelry of B., the townships of Claughton, Oxton, Tranmere, and part of Higher Bebington. Pop. (1871) of the township, 42,981; of the parliamentary borough, 65,971. B. has within the last few years risen from comparative obscurity to its present important position. No later than 1818, only a few straggling houses existed, and the pop. numbered 50. In 1821, it amounted only to 236. The principal streets of B. are laid out with great regularity, crossing each other at right angles, and about 20 yards wide; but the back streets are narrow and the houses mean. Hamilton square, a quadrangle of about 8 acres, is scarcely excelled by any buildings in the United Kingdom. The park is a splendid feature of B., consisting, as it does, of 190 acres. B. is so situated as to have communication with the entire railway system of the country. A railway bridge over the Mersey at Runcorn was opened for traffic in 1869, which shortened by 10 m. the distance between the Liverpool and Birkenhead docks. It is to these docks chiefly that B. owes its rapid development and prosperity. The original idea is due to the late Mr. Laird, who in 1824 purchased, at a very low price, a large piece of ground on the borders of the Wallasey pool, on which he meant to start a ship-building yard. Discovering the capabilities of the site, he began to project plans for extensive docks; and the corporation of Liverpool, dreading the rivalry, purchased the pool and the lands about it; and in 1847, two docks, the Morpeth and the Egerton, were opened by lord Morpeth, the chief commissioner of woods and forests. Other docks, and a great floating harbor, were subsequently added, and now they have a reputation wide as the world, as splendid specimens of engineering skill.

B. has for some years been celebrated for its ship-building yards, some of the largest iron ships afloat having been built there by extensive firms. The too historical *Alabama* was built by the Messrs. Laird, to whose enterprise, more than that of any other company, the town owes its present eminence. In the neighborhood of the docks are the Canada works for the construction of gigantic bridges, the Britannia machinery works, and others.

B. owes its origin to a Benedictine priory founded there in the 12th c., of which some remains still exist. Edward II. granted the entire monopoly of the ferries to its monks. The remains of the monastery are still in a tolerable state of preservation, exhibiting some fine specimens of the English architecture of the period of its foundation.

BIRKET-EL-KEROON, a lake in Fayoom, Egypt, 30 m. by 6, communicating with the Nile and the canal said to have been made by Joseph. It was once connected with lake Mœris, with which it was often confounded. The name means "lake of the horn," and alludes to its shape.

BIRMAH. See BURMAH.

BIRMINGHAM, a village in Connecticut, at the junction of the Naugatuck and Housatonic rivers, 11 m. w. of New Haven, on the Naugatuck, and the New Haven and Derby railroads; pop. '70, 2103. The first large manufactory of pins in the United States was begun in New York in 1836, and removed to B. in 1838. There are also rolling-mills, spring and axle factories, and other metal-working industries. B. is connected with Derby by a bridge over the Naugatuck.

BIRMINGHAM, the chief t. in Britain for metallic manufactures, and supplying much of the world with hardwares, stands near the center of England, in the n.w. of Warwickshire, with suburbs extending into Staffordshire and Worcestershire, 112 m. n.w. of London. Built on the e. slope of three undulating hills, on the Rea and the Thames, on a gravelly foundation overlying clay and new red sandstone, and supplied with plenty of water, it is one of the best drained towns in England, while the means which have been adopted for the prevention of smoke-contamination of the atmosphere are so far effectual that the air is unusually clear and salubrious. The older part of B. is crowded with workshops and warehouses; but the modern is well built, and possesses some architectural beauty. Among the finer buildings are the post-office, the corporation buildings, the town hall, the exchange, the rooms of the royal society of artists. B. began very early to be the seat of iron manufactures, from its vicinity to a forest and extensive iron mines; but its industry and trade were long small. Its high commercial importance dates from the 17th c., when the restoration of Charles II. brought from France a fashionable rage for metal ornaments, and B. supplied the demand with unexampled vigor. From being the "toy-shop of Europe" of Burke's time, B. now constructs steam-engines, hydraulic-presses, and crystal palaces; and its hardwares are unequaled in the world for quantity, variety, and value. Pop. 1690, 4000; 1801, 60,822; 1851, 232,841; 1861, 296,076; 1871, 343,787. B. returns three members to parliament. It produces upwards of £5,000,000 worth of goods yearly, chiefly articles made of gold, silver, iron, brass, steel, mixed metal, plated metal, glass, papier-maché, japanned and electrotyped articles; including firearms, ammunition, swords, metal ornaments, toys, jewelry, buttons, buckles, lamps, pins, steel-pens, tools, locks, bedsteads, saddlery, steam-engines, and all sorts of machinery. In B. 1000 ounces of gold are made into chains weekly; at least 70 ounces of gold-leaf are used weekly; 30,000 gold rings are made yearly; 150,000 ounces of silver are used yearly; a billion of steel-pens are made yearly, more than 500 tons of steel being used; above 80,000 copper coins are struck daily; 20,000,000 nails are made weekly at one work; 5,000,000 firearms were made between 1804 and 1818; and during the Crimean war the government were supplied with 3000 muskets weekly. The button manufacture of B. is very large. The steam-engines in B. are estimated as equal to 10,000-horse power, and consume 600 tons of coal daily. In B. above 20,000 families are engaged in trade, manufacture, and handicraft. B. has more than 170 places of worship, about 60 belonging to the Establishment; a grammar-school, founded in 1552, with a yearly revenue of £12,000; a queen's college connected with the London university; a well-conducted literary and scientific institute (the Midland institute); a free reference and central public library, also five free branch libraries; a Roman Catholic college and cathedral; a botanic garden; an art-gallery; and four public parks. It is famed for its charitable institutions, and in B. was originated the system of annual collections for local charities. The town-hall can hold 6000 persons, and has a magnificent organ, and a musical festival is held in it once every three years. Of the many ways of spelling the name of this city, the oldest is that given in *Doomsday Book*—namely, Bermingeham. This was corrupted into Brummagem, a name which has become synonymous with worthless wares with a glittering outside. B. took the parliament side in 1643, supplying swords, and using them well against prince Rupert and his lancers. In 1791, a B. mob denounced the distinguished Dr. Priestley as an atheist and Jacobin, destroyed his house, library, and apparatus, besides much other property; a statue has recently been erected to his memory. Near Handsworth, a little to the s. of B., were the famous Soho works, founded by Watt and Boulton, where steam-engines were first made. Handsworth church has a statue of Watt by Chantrey, and a bust of Boulton by Flaxman. Darwin, author of *Zoonomia,* and Withering the botanist, lived in Birmingham. Thomas Attwood originated the political union here, which greatly hastened the passing of the reform act in 1832, and the enfranchisement of Birmingham.

BIRNAM, a hill 1580 ft. high, in the e. of Perthshire, near Dunkeld, 12 m. n.w. of Perth, and 12 m. w.n.w. of Dunsinnan hill, one of the Sidlaws. It commands a fine view of the valley of the Tay. It was formerly covered by part of an ancient royal forest. Shakespeare has immortalized B. wood in his tragedy of *Macbeth.*

BIRNEE, OLD and NEW, the name of two towns of Burnu, central Africa. Old B., which was formerly the chief city of the empire, walled and of vast extent, is situated on the banks of the Yeu, about 70 m. n.w. of the modern capital, Kuka, or Kukawa, and about 75 m. w. of lake Tsad, in lat. 13° n., and long. 13° 15′ e. It is now greatly deserted and decayed, but it has still a population estimated at 10,000, and considerable markets. New B. is about 20 m. s. of Kuka, is walled, and has a large mud palace. Population about the same as that of Old Birnee.

BIRNEY, DAVID BELL, 1825–64; b. Alabama; son of James G. He entered the union service during the civil war, and rose to the rank of brig.gen., commanding a division at the battle of Gettysburg.

BIRNEY, JAMES G., 1792–1857; b. Kentucky; graduate of the college of New Jersey; went to Alabama, where he practiced law and became a member of the legislature; removed to Kentucky, and was a professor in Danville university. In 1834, he emancipated his own slaves and advocated universal liberty, shortly afterwards settling in Cincinnati, and starting *The Philanthropist*, one of the earliest journals to advocate the abolition of slavery, for which the printing-office was several times mobbed and partially or wholly destroyed. He was secretary of the American anti-slavery society, and prominent in the organization of the liberty party, which, in 1840, and again in 1844, made him their candidate for president. In the latter year he got 62,300 votes in 13 states, and his candidacy deprived Henry Clay of the electoral votes of both New York and Michigan, thereby electing Polk and securing the annexation of Texas, and a wide extension of the slavery to which B. was himself so ardently opposed. But this extension of slavery opened the way for those demands in its behalf which ended in secession and rebellion, and, through these, in its abolition.

BIRNEY, WILLIAM, son of James G., was a union officer in the civil war, and rose to be brig.gen. of volunteers. FITZHUGH, youngest son of James G., died in the union service with the rank of colonel.

BIRON, ARMAND DE GONTAULT, Duc de, d. July 26, 1592; a French gen. of the 16th c.; grand master of artillery, commanding at the siege of Rochelle and in Guienne. He was among the first to declare for Henry IV. He brought Normandy under subjection, and dissuaded Henry from going to England. B. was killed by a cannon-shot at the siege of Epernay.

BIRON, or BIREN, ERNEST JOHN DE, Duke of Courland, b. 1687, was the son of a landed proprietor in Courland, of the name of Bühren. He studied at Königsberg, and in 1714 visited St. Petersburg, where his handsome person and cultivated mind soon gained him the favor of Anna Ivanovna, niece of Peter the great. When Anna ascended the throne of Russia in 1730, Biron repaired to court and was loaded with honor. He assumed the name and arms of the French dukes de Biron, and soon swayed all Russia through his royal mistress. Proud and despotic by nature, he hated every one who stood in the way of his ambition. The princes Dolgorucki and their friends were his first victims. More than a thousand persons were executed by his orders, and a still greater number sent into banishment. The empress is said to have often thrown herself at his feet to induce him to relent, but her prayers and tears were of no avail. It is, however, undeniable, that by the strength of his character he introduced vigor and power into every branch of the public administration throughout Russia. In the year 1722, he married a Courland lady, and in 1737 the Courlanders were compelled to choose him as their ducal ruler. By his desire the empress, on her death-bed, appointed him guardian and regent during the minority of her presumptive heir, prince Ivan. On the death of the empress (28th Oct., 1740), Biron assumed the regency, and acted with great prudence and moderation. A secret conspiracy was, however, soon formed against him, and on the night of the 19th Nov. he was arrested, by the orders of field-marshal Münnich, and conveyed to the fortress of Schlüsselburg, where he was tried and sentenced to death. His sentence was afterwards commuted to imprisonment for life, and confiscation of his property. He was now, along with his family, conveyed to Pelim, in Siberia. When, in the following year, Elizabeth ascended the throne of Russia, B. was recalled, and Münnich sent to occupy his prison in Siberia. The sledges met at Kasan; the two enemies looked at each other, but continued their journeys without exchanging a word. During the remainder of Elizabeth's reign, B. continued to reside with his family at Jaroslaw. The empress Catharine II. restored to him the duchy or Courland, and he died 28th Sept., 1772.

BIRON, CHARLES DE GONTAULT, Duc de, 1562–1602; son of Armand; made duke of Biron and admiral of France by Henry IV. He was a man of great intrepidity, but fickle and treacherous. He was sent to England in 1601 to announce the marriage of Henry with Mary de Medici; but about the same time he was caught in treasonable correspondence with Spain, and was beheaded in the Bastile.

BIRR. See PARSONSTOWN.

BIRS, a small but famous affluent of the Rhine. It rises in the canton of Bern, Switzerland, near the pass of the Jura called Pierre Pertuis, flows in a north-easterly direction through the Münsterthal, and enters the Rhine near Basel. In a narrow gorge through which the stream breaks, at a little distance from that city, 500 confederate Swiss died heroically, on the 26th Aug., 1444, in battle against the French army under the dauphin Louis. On the same river, near the village of Dornbach, about a mile and a half s. of Basel, 6000 confederate Swiss gained a splendid victory over 15,000 Austrians, under Fürstenberg, on the 22d of July, 1499; in consequence of which, the emperor Maximilian signed a peace at Basel on the 21st of September following.

BIRS NIMRUD. See BABEL, TOWER OF, *ante*.

BIRSTALL, a parish in Yorkshire, England, s.w. of Leeds; pop. '71, 43,405; with manufactories of silk, cotton, wool, etc., and coal and iron mines.

BIRTH. The act of coming into life has an important legal bearing in regard to the evidence of its legitimacy or illegitimacy. These qualities are variously determined by the regulations of different systems of jurisprudence. The ancient Roman law, as well as the modern Prussian and French codes, in particular, contain anxious provisions on the subject. In England, no precise time appears to be prescribed for fixing legitimacy or illegitimacy of birth. Forty weeks is considered, in practice, the more usual time for legitimate births, but a discretion to allow a longer time is exercised, when, in the opinion of medical men, or under the peculiar circumstances of the case, protracted gestation may be anticipated, or is likely to occur. In Scotland, the law is more distinct. There, in order to fix bastardy on a child, the husband's absence must continue till within six lunar months of the birth, and a child born after the tenth month is accounted a bastard. The fact of legitimacy or illegitimacy may be judicially determined by an action of declarator in the court of session, which concludes, according to the nature of the case, for the legitimacy or illegitimacy of the party whose birth is the subject of the legal inquiry. In England, legitimacy may be ascertained by proceedings in the court for divorce and matrimonial causes, under the 21 and 22 Vict. c. 93, called the "legitimacy declaration act, 1858;" but there the remedy is not so complete as that afforded by the Scotch declarator, which may decree not only legitimacy, but also *illegitimacy*. See BASTARDY, HEIR, INHERITANCE.

BIRTH, *ante*, the act or fact of being brought into the world. To fulfill the condition of a living birth the whole body must be brought into the world and detached from the mother, and after such detaching the child must be alive and must have in action the changed and independent system of circulation which follows the severance of the umbilical cord. And yet, the killing of a living child before the separation of the cord is held to be murder, except when necessary for saving the mother's life.

BIRTH, CONCEALMENT OF, is an offense against the public economy, and punishable as a misdemeanor. By the 9 Geo. IV. c. 31, s. 14, it is enacted, that any woman endeavoring to conceal the birth of a child, shall be liable to be imprisoned, with or without hard labor, for any term not more than two years: and it shall not be necessary to prove whether the child died before, at, or after its birth. It is also provided, that if any woman tried for the murder of her child shall be acquitted thereof, it shall be lawful for the jury, so acquitting her, to find her guilty (if the case be so) of concealing the birth: upon which the court may pass the same sentence as if she had been committed upon an indictment for the concealment.

In Scotland, the law on this subject appears to be regulated by the 49 Geo. III. c. 14, by which it is enacted, that if a woman shall conceal her being with child during the whole period of her pregnancy, and shall not call for, or make use of help or assistance in the birth; and if the child shall be found dead, or be amissing, she shall be imprisoned for a period not exceeding two years. It has, however, been decided, that disclosure by the mother to the putative father is a sufficient defense. The punishment usually awarded for this offense in Scotland, is imprisonment from three to six, and in aggravated cases, from nine to eighteen months. See PREGNANCY, CONCEALMENT OF.

BIRTHRIGHT. See INHERITANCE, and PRIMOGENITURE.

BIRTHS, REGISTRATION OF, as also that of *burials* and *marriages* (q.v.), is regulated by the 6 and 7 Will. IV. c. 86, amended by the 7 Will. IV. and 1 Vict. c. 82, by which a general register-office for the whole of England is established. The registrar-general shall, under the act, furnish a sufficient number of strong iron-boxes to hold the register-books, and every such box shall be furnished with a lock and two keys, one of which shall be kept by the registrar, and the other by the superintendent-registrar; and while the register-books are not in use, they are to be kept in the register-box, which shall always be kept locked. The form for general registration of births, comprises the time of birth, name and sex of the child; the name, surname, maiden surname, and profession of the parents; the signature, description, and residence of the informant (who must be the father or mother, or in case of their inability, the occupier of the house, s. 20); the date of registration and signature of the registrar; and also the child's baptismal name (if any be given after registration, within six months). Searches may be made, and certified copies obtained, at the general registrar-office, or at the office of the superintendent-registrar of the district, or from the clergyman, or registrar, or any other person who shall for the time being have the keeping of the register-books. By 3 and 4 Vict. c. 92, provision is made for depositing with the registrar-general a number of non-parochial registers and records of births, baptisms, deaths, burials, and marriages, which had been collected by a commission appointed for that purpose, and for rendering such registers and records available as evidence. For other regulations on the subject of this article, see 21 Vict. c. 25.

The Scotch law relating to the registration of births commenced with 17 and 18 Vict. c. 80, by which a registrar-general, parochial registrars, and other officers are appointed with suitable machinery for carrying out the provisions of the act. It is the duty of the

local registrar to ascertain and register all births within his parish or district, without fee or reward, save as provided by the act; but parents, or persons in charge of children after their birth, are required to give information of such births, and to sign the register; and after the expiration of three months following the day of birth, it shall not be lawful for the registrar to register the same, except as provided by the act. The act declares that the sheriff of the county shall have the care and superintendence of the parochial registrars; and, as in England, the registrar-general is directed to furnish strong iron boxes to hold the registers and other documents, such box to have a lock with two keys, one of which shall be kept by the registrar, and the other by the sheriff. The 36th section contains the noticeable provision, that in the case of children legitimated by subsequent marriage of the parents, but who were originally registered as illegitimate, such registration shall be corrected by an entry of the marriage on the margin. The act contains other provisions, more or less corresponding to the enactments of the above English statutes, and has been amended by the acts 18 and 19 Vict. c. 29; 19 and 20 Vict. c. 96; and 23 and 24 Vict. c. 85.

BIRTHS, REGISTRATION OF, and of MARRIAGES and DEATHS (*ante*), formerly entirely neglected, but of late years regulated by law in several of the states, especially in Massachusetts, New York, and New Jersey. The record of deaths has been passably well kept in all the country for many years, but not until recently have those of marriages and births been so treated. At present the officiating minister, priest, or magistrate at a wedding, and the physician or midwife at a birth, are required, under penalty for failing to do so, to report to the proper bureau the name, age, sex, nativity, color, and social condition of the persons who marry, and the sex, color, and nativity of parents in case of birth. The U. S. census reported the number of deaths (in the census year) in 1850, and in 1880 the bureau is making a special effort to have the record comprehensive and complete.

BIRTHS, DEATHS, AND MARRIAGES. See VITAL STATISTICS.

BIRTHWORTH. See ARISTOLOCHIA.

BIRU', BEEROO', or BEROO', a kingdom of Sudan, western Africa, in lat. 15° to 16° n., long. 5° 30′ to 7° 15′ west. It is bounded on the n. by the Sahara, on the e. by the Niger, and has Bambarra on the south. Its western limits are not clearly defined. The capital t., Walet, is about 260 m. w.s.w. from Timbuctoo.

BIS, in music, denotes that the passage over which it is placed is to be played twice, or repeated. Such passages generally have a slur or bow over them, and the word "bis" written below it, thus $\overset{\frown}{\text{Bis}}$.

BISAC'CIA, a t. of the Italian province of Avellino, situated on a hill about 30 m. e.n.e. of Avellino, with a population of about 6000. Numerous ancient remains discovered here appear to fix B. as the site of the old *Romulea*, captured by the Romans in the third Samnite war.

BISACQUI'NO, or BUSACCHI'NO, a t. of Sicily, about 27 m. s. of Palermo, with a population of 9120, who carry on an extensive trade in grain and oil.

BISCAY, or VIZCAYA, the most northerly of the Basque provinces (q.v.), is bounded n. by the Bay of Biscay; e. and s. by its sister-provinces, Guipuzcoa and Alava; and w. by Santander. It has an area of about 1300 sq.m., and a population, in 1870, of 187,926.

BISCAY, BAY OF, that portion of the Atlantic ocean which sweeps in along the northern shores of the Spanish peninsula in an almost straight line from cape Ortegal to St. Jean de Luz, at the western foot of the Pyrenees, and thence curves northward along the w. shores of France to the island of Ouessant. Its extreme width is about 400 m., and its length much about the same. The depth of water varies from 20 to 200 fathoms, being greatest along the n. shores of Spain. The whole of the s. coast is bold and rocky, in some places rising to a height of several hundred feet, and interspersed with short inlets, some of which form safe and commodious harbors. From the mouth of the Adour to the Gironde, the shore presents a totally different aspect, being low and sandy, with numerous lagoons, the embouchures of these two rivers forming the only harbors. For 200 m. n. the coast is still low, but marshy instead of sandy; and from the peninsula of Quiberon northward to Ouessant, it is moderately elevated and rocky in some places, with several good harbors. The rivers falling into the Bay of B. on the Spanish shores are unimportant, none of them having a course of more than 30 or 40 miles. On the coast of France, it receives, through the rivers Loire, Charente, Gironde, and Adour, the waters of half the surface of the whole country. Its chief ports are Gihon, Santander, Bilbao, San Sebastian, and Passages, in Spain; and Bayonne, Bordeaux, Rochefort, La Rochelle, and Nantes, in France. Its chief islands—which are all situated n. of the Gironde—are Belleisle, Ré, and Oléron. Navigation is rendered difficult and dangerous by the prevalence of n.w. winds (which drive in through the wide mouth of the bay large volumes of water from the Atlantic, to be again thrown back from the long regular line of coast towards the center, thus causing great commotion, and high, short, broken waves), and by the existence of a current—called Rennel's current—which sweeps in from the ocean round the n. coast of Spain,

along the w. and n.w. coast of France, then shooting across the British channel, brushes the Scilly isles, and after approaching the coast of Ireland, turns w. and s., till it joins the n. African current.

BISCE'GLIE, a seaport t. of Italy, on the Adriatic, in the province of Bari, in the former kingdom of Naples, 21 m. n.w.-by-w. from Bari. It is built on a rocky promontory, defended by strong fortifications. The fort admits only vessels of small burden. B. is a bishop's seat, and has a cathedral, besides two collegiate and several other churches, convents, a seminary, a hospital, etc. Rain-water is collected in public reservoirs, the water-supply being otherwise very insufficient. Pop. '72, 21,371. Around the town are many fine villas and country-houses. The neighborhood produces good wine, and has acquired particular celebrity for its currants, which are said to be equal to those of the Ionian islands. During the crusades, B. was famous for its hospital, founded by Bohemond, for pilgrims from the holy land, of which some ruins still exist.

BIS'CHOF, KARL GUSTAV, a distinguished chemist and geologist, was b. at Nürnberg (1792), and became professor of chemistry at Bonn in 1822. Having obtained the prize of the scientific society of Holland for his treatise on internal terrestrial heat, he published in England, in connection with it, *Researches on the Internal Heat of the Globe* (Lond. 1841), which was followed by a number of papers on connected geological subjects. The results of his researches (1837–40) on inflammable gases in coal-mines, and on safety-lamps, appeared in the *Edinburgh New Philosophical Journal* and other periodicals. His chief work is his *Manual of Chemical and Physical Geology.* He died at Bonn in 1870.

BIS'CHOFF, THEOD. LUDW. WILH., anatomist and physiologist, was b. in Hanover, 1807; became professor of anatomy in Heidelberg in 1836. From Heidelberg he removed, in 1843, to the university of Giessen, and in 1854 to that of Munich. He has devoted himself especially to embryology, to which he has made many contributions. His *Entwickelungsgeschichte des Kaninchencies* (Bruns. 1843) received the prize from the Berlin academy. Of his numerous writings in Müller's *Archiv*, and published separately, may be singled out the *Beweis der von der Begattung unabhängigen periodischen Reifung und Loslösung der Eier der Säugethiere und der Menschen* (Giess. 1844), in which he establishes the important doctrine of the periodic ripening and detachment of the ova in mammalia and man, independently of generation. Being called upon, in 1850, along with Liebig, to give his opinion in the famous Görlitz process (q.v.), which involved the question of the possibility of spontaneous combustion, he took occasion to give a dissertation *Uber die Selbstverbrennung* (on Spontaneous Combustion), demonstrating its impossibility, which is published in Henke's *Annals of Legal Medicine* (1850).

BIS'CHWEILER, a German t. situated on the Moder, about 14 m. n. of Strasburg. B. was formerly fortified, but was dismantled in 1706. It has manufactures of earthen wares, coarse woolens, linens, and gloves, and a trade in beer, leather, and the agricultural produce of the district. Pop. '71, 9231.

BISCUIT, in pottery, is the term applied to porcelain and other earthenware after the first firing, and before it has received the glaze and embellishments. See PORCELAIN and POTTERY. In this condition, the ware is very porous, adheres to the tongue when placed upon it, and allows water very slowly to percolate through its pores. The unglazed bottles employed in cooling water are examples of biscuit-*ware.*

BISCUIT, MEAT, a preparation of the substance of meat combined with a certain quantity of flour, made into the form of biscuits, by which process the nutritive qualities of the meat are preserved for any length of time. One way of preparing these biscuits is as follows: Large pieces of beef are placed in a quantity of water sufficient to cover them, and are subjected to slow ebullition. The fat being skimmed off, evaporation is allowed to take place, until the liquid is about the consistency of syrup, when it is mixed with fine wheaten flour, rolled out to the thickness of ordinary ship-biscuit, cut into any shape required, baked, and dried in the ordinary manner. One pound of biscuit usually contains the soluble part of 5 lbs. of meat and half a pound of flour. The meat-biscuits can be eaten like ordinary biscuits; but boiled in about twenty times their own weight of water for half an hour, with the usual condiments, they make excellent soup, and for this they were chiefly intended. Meat-biscuits were first introduced into Britain from America by Mr. Borden, in the year 1851. They have been spoken highly of by medical men as food, and are still made to a limited extent; but one purpose they were first intended to serve—that of preserving the animal food of South America and Australia—has since been more effectually done by other means. See PRESERVED PROVISIONS.

BISCUITS (Fr., twice-baked), small, flat bread, rendered dry and hard by baking, in order to their long preservation. They are divided into two classes—the *unfermented* and the *fermented. Unfermented* or *unleavened* B., generally known as *common sea-biscuits* or *ship-bread*, are made of wheaten-flour (retaining some of the bran), water, and common salt. The materials are kneaded together, either by manual labor—that is, by the hands and feet of the workmen—or by introducing the materials into a long trough or box, with a central shaft, to which a series of knives is attached, and which is made to revolve rapidly by machinery. The mass of dough so obtained is then kneaded and thinned out into a sheet the proper thickness of the B., by being passed and repassed

between heavy rollers. This sheet being placed below a roller with knife-edge shapes, is readily cut into hexagonal (six-sided) or round pieces of dough of the required size of the biscuits. The indentation of the slabs of dough, in the case of the hexagonal B., is not complete, so that all the B. cut out of each slab remain slightly adhering together. These slabs of B. are then introduced into an oven for about 15 minutes, and are placed in a warm room for 2 or 3 days to become thoroughly dry. The more modern oven is open at both ends, and the B. being placed in a frame-work, are drawn by chains through the oven. So rapidly is this operation conducted, that about 2000 lbs. weight of B. are passed through one of these ovens every day of ten hours.

Captains' B. are prepared from wheaten-flour, water, with common salt, and butter, with an occasional small dose of yeast to cause partial fermentation. Milk is also sometimes employed. *Water or hard B.* are made of flour, water, with variable quantities of butter, eggs, spices, and sugar. *Soft B.* contain increased quantities of butter and sugar. *Yeast B.* are those the dough of which is mixed with a small quantity of yeast, yielding more porous biscuits. *Buttered B.* are made with much butter and a little yeast. Other varieties of B. are named in the following table, which gives the materials added to the sack of flour, 280 lbs. in weight:

	Water or milk. quarts.	Butter. lbs.	Sugar. lbs.	Flavoring. Caraway seeds. in ozs.	Eggs.
Captains'	10	15	..	..	..
Abernethy	8¾	17½	17½	17½	..
Machine	5¾	58	14	..	..
American	10	40	..	..	..
Jamaica	8¾	17½	17½	..	..
Coffee	8¾	17½	..	..	140

Great care must be taken in the manipulative part of the process to incorporate the ingredients in a systematic manner. Thus, the butter is mixed with the flour in a dry condition, and then the water or milk added; and when eggs are used, they are thoroughly beaten up with water, and the sugar (if the latter is required) and the egg-paste added to the dough, which has been previously prepared with butter, or without butter. The various kinds of B. in the preparation of which yeast is employed, present a more spongy aspect than the unyeasted biscuits. Occasionally a little sesquicarbonate of ammonia (volatile salt) is added, to assist in raising the dough, and make a lighter biscuit. There are three principal varieties of the yeast or fermented B., and the following table gives the ingredients used in their manufacture from a sack of flour, or 280 lbs.:

	Water or milk. gals.	Dried yeast. lbs.	Butter. lbs.	Sugar. lbs.
Oliver	10½	4½	35	..
Reading	..	4½ to 5	25 to 30	
Cheltenham	10½	....	....	5

Soft or spiced B. are prepared from flour, with much sugar, a great many eggs, some butter, and a small quantity of spices and essences. The eggs tend to give a nice yellow cream-color to the B., which is occasionally imitated by the admixture of a chromate of lead (*chrome yellow*); but this is dangerous, and has given rise to several cases of poisoning. Several of the soft or spiced B. are referred to in the following table, a sack, or 280 lbs., being the amount of flour employed in each instance:

	Eggs.	Sugar. lbs.	Butter. lbs.	Flavor.
Tunbridge cakes	930	140	23	Orange flower, Water currants, Citrons and caraways.
Shrewsbury	93	93	93	Volatile salt, Cinnamon, Nutmeg or mace.
Ginger wafers	600	112	112	Ginger.
Victoria	750	70	80	Essence of lemon.

The extent to which B. are now consumed may be learned from the fact, that several of the largest biscuit-manufactories each prepare and throw into market every week from 30,000 to 50,000 lbs. weight of B. of various kinds. One of the largest and most complete biscuit-manufactories in England is that of Carr at Carlisle, whose biscuits, sold in tin-boxes, are well-known. Another bakery of this kind is that of Harrison of Liverpool.

BISE'GLIE, a fortified t. of Italy, in the province of Bari. It is built on a promontory in the Adriatic, about 21 m. w.n.w. of Bari, the district around being studded with handsome villas and country-houses, and famous for its production of currants, which are considered equal to those of the Ionian islands. The vine and olive are also cultivated in the neighborhood. B. has a cathedral, numerous churches, two monasteries, a hospital, an ecclesiastical college, etc., with the ruins of a hospital founded by Bohemond for pilgrims from the Holy Land, and celebrated during the crusades. Pop. '72, 21,371.

BISHAREEN', nomadic tribes living between the Red sea and the Nile; professed Mohammedans but almost uncivilized, without firearms, and accustomed to robbing. They possess camels, goats, horses, and sheep, and are nominally subject to the viceroy of Egypt.

BISHOP, the title of the highest order of clergy in the Christian church. The name is in the Saxon, *biscop*, and is from the Greek, *episcopos*, an overseer. The Athenians used to send officers called *episcopoi* to their subject states. The word was adopted by the Romans; and Cicero speaks of himself as an *episcopus* in Campania; it was also applied by them to the officers who inspected the provision-markets. There are two theories as to the functions of a B. in the primitive church, which may be described as the Episcopalian and the Presbyterian theories.

According to the former, the first bishops in the Church of Christ were his apostles; "for the office whereunto Matthias was chosen is termed (Acts i. 20) *episcope*—i.e, an episcopal office, which being spoken expressly of one, agreeth no less unto them all; and therefore St. Cyprian, speaking generally of them all, calls them *bishops*." The form of government at first established by the apostles was that the laity or people should be subject to a college of ecclesiastical persons appointed for that purpose in every city. These, in their writings, they term sometimes "presbyters," sometimes "bishops." Thus St. Paul to the elders at Ephesus says: "Take heed to the flock over which the Holy Ghost hath made you *overseers*"—i.e., bishops. This explains the Presbyterian view of the office. But as the apostles could not themselves be present in all churches, and as in a short time strifes and contentions arose, they appointed, after the order began at Jerusalem, some one president or governor over the rest, who had his authority established a long time before that settled difference of name took place whereby such alone were called bishops; and therefore, in the book of Revelation, we find that they are entitled "angels." St. Irenæus, martyred in the 2d c., says: "We are able to number up them who by the apostles were made bishops." In Rome he tells us, they appointed Linus; and in Smyrna, Polycarp. St. Ignatius witnesses that they made Evodius B. of Antioch. St. Jerome says: "All bishops are the apostles' successors;" and St. Cyprian terms bishops "*præpositos qui apostolis vicaria ordinatione succedunt*" (presidents who succeed to the apostles by vicarious ordination). Hooker says, in his usual judicious manner: "Such as deny apostles to have any successors at all in the office of their apostleship, may hold that opinion without contradiction to this of ours, if they will explain themselves in declaring what truly and properly apostleship is. In some things, every presbyter, in some things only bishops, in some things neither the one nor the other, are the apostles' successors." And he adds, what fairly states the Episcopal theory on this subject: "The apostles have now their true successors, if not in the largeness, surely in the kind of that episcopal function whereby they had power to sit as spiritual ordinary judges, both over laity and over clergy, where churches Christian were established." We find, also, that throughout those cities where the apostles did plant Christianity, history has noted a succession of pastors in the seat of *one*, not of many; and the first one in every rank we find to have been, if not some apostle, yet some apostle's disciple. By Epiphanius, the bishops of Jerusalem are reckoned down from St. James to his own time; and Tertullian, writing in the 2d c., has the following: "Let them show the beginnings of their churches, let them recite their bishops one by one, each in such sort succeeding other that the first B. of them have had for his author and predecessor some apostle, or at least some apostolical person who persevered with the apostles; for so apostolical churches are wont to bring forth the evidence of their estates." The judgment of the church of England as to the primitive existence of bishops is to be found in the preface to the ordination service, drawn up in the reign of Edward V., where it is said: "It is evident unto all men diligently reading the Holy Scripture and ancient authors, that from the apostles' time there have been these orders of ministers in Christ's church—bishops, priests, and deacons.

According to the other or Presbyterian theory of bishops, the origin and general history of the institution are thus sketched. In the earliest churches, no traces of a hierarchy, it is affirmed, are to be found. The superintendents or directors appointed over the first churches by the apostles, or chosen by the members of the congregations, were unquestionably styled indifferently presbyters or bishops—the former title being borrowed from the Jewish synagogue, the superintendent or director of which was called the elder (Gr. *presbyter*); the latter (*episcopos*) being familiar to the heathen converts as the title of a civil office corresponding in function to that of a Christian pastor. But this original equality did not last long. As new churches multiplied, those formed round the original church, though each having its own bishop or presbyter, remained in confederacy; and in the meetings of the pastors to regulate the common affairs, one must of necessity preside, most likely determined by age, superior piety, or other qualification. From this simple circumstance, as is indicated by Clemens Alexandrinus in the beginning of the 3d c., sprang the habit of looking upon one of the bishops as superior to the others; and this superiority, at first personal and accidental, soon came naturally to be regarded as attached to the B. of a particular congregation. In his case the word B. came to signify an overseer of pastors rather than an overseer of people. The monarchical form of state government favored this tendency, and con-

verted the president of a presbytery into the privileged superintendent of his brother-pastors. The assumption was resisted by the presbyters at first, but from the middle of the 5th c., episcopacy, or the domination of bishops, continued to gain the upper hand over presbyterianism, or equality of all pastors.

In the 3d c. bishops appear still dependent on the advice of their presbyters, and the consent of the people, and shared with the former the office of teaching and the cure of souls. As yet their exclusive privileges or functions were limited to confirmation, ordination of ministers, consecration of sacred things, settlement of secular differences among Christians, and management of the revenues of the church. But the tendency to subordination and unity did not rest here. Among the bishops, at first all equal, those of the larger and more important cities began gradually to acquire a superiority over those of inferior cities. When Christianity was made the religion of the Roman empire, the bishops became more and more monarchical, and put themselves on the footing of ecclesiastical princes. The chief cities of the larger civil provinces rose to be seats of extensive dioceses, the bishops of these assuming the distinctive titles of *patriarch*, *metropolitan*, *papa*—titles of courtesy that had long been applied to all bishops; while the less important provinces, with their capitals and bishops, became subordinate. Among these provincial bishops, again, three, from obvious causes, acquired a prominence that cast all the rest into the background—namely, Alexandria, Constantinople, and Rome. The beginnings of the ascendency of the Roman B. are discernible as early as the end of the 2d century. While ancient Rome sought her secular dominion more in the s. and e., modern ecclesiastical Rome turned herself chiefly to the nations of the w. and n.; and round the B. of Rome has grown a power—the Roman Catholic church—not less important than that of imperial Rome.

In the Roman Catholic church, the episcopal office is the foundation of the whole system. Christ's apostles are held to have transferred their functions to the episcopacy as a body. Every B., therefore, exercises within his own diocese, first, the *jus magisterii*—i.e., the right of maintaining and propagating the orthodox faith; and second, the *jus ordinis*, or regulation of the sacred and mysterious rites of the priestly office, some of which are transferred to the inferior clergy, as *jura communia*, while others remain the privileges of the bishop (*jura propria*). Among episcopal prerogatives, in addition to those already mentioned as assigned to them in the 3d and 4th c., are anointing of kings, consecration of abbots, preparation of the chrisma, etc. They have also the management of the church-property in their respective dioceses, and the oversight of all ecclesiastical institutions. Election to the office of B. rests generally with the presbyters of the diocese assembled in chapter, with the sanction of the secular power and of the pope. This is the case in Prussia. Where the sovereign is a Catholic, the appointment is mostly made by him, but subject to papal approbation. At consecration, which requires the presence of three bishops, the new B. takes an oath to the sovereign and to the pope, and signs the articles of belief, on which he receives the episcopal insignia—the miter (q.v.); crosier (q.v.) or staff; a gold ring, emblematic of his marriage to the church; the cross upon the breast; the dalmatica (q.v.), tunic, pallium (q.v.), and peculiar gloves and chaussure; and being enthroned, as formal installation into office, he then pronounces the blessing on the assembled people. In the discharge of his office, the B. has a number of subordinate assistants; sometimes, in case of age or weakness, a coadjutor, but ordinarily deans, archdeacons, etc. (q.v.)

In the Greek church, the office of B. is essentially the same, though less influential. Greek bishops, however, are always chosen from the monkish orders, and generally from the archimandrites—i.e., abbots or priors.

As Protestantism met with its chief resistance from the bishops, and, besides, laid the chief stress on doctrine rather than on church order, the episcopal order, in most of the reformed churches, either disappeared or sank into comparative insignificance. Of the continental Protestant churches, episcopacy has kept the foremost hold in Sweden and Norway. The Scandinavian bishops acceded to the reformation in 1531 only on compulsion from Gustavus Vasa, who confirmed them in their revenues and prerogatives. The B. of Upsala is primate, and has the prerogative of crowning the king, consecrating the other bishops, etc. The bishops are named by the king out of three proposed by the chapters. They preside in consistories, hold synods, visit the churches, examine and ordain ministers, consecrate churches, and watch over purity of doctrine and the property of the church. They have seats in parliament, and wear the pallium, miter, crosier, and cross. There are only six bishops in Sweden and Norway, with an additional B. of the order of the seraphim.

In Denmark, the Catholic bishops opposed the reformation, and were (1536) deposed by Christian III., and their extensive possessions confiscated. The king appointed in their stead a general superintendent and 9 Protestant bishops, with a fixed stipend. They are under the secular government, and have very limited authority over the clergy under their charge. The first in rank is the B. of Seeland.

In Protestant Germany, the episcopal dignity and rights passed into the hands of the secular sovereigns, who, down to quite recent times, assumed the title of supreme bishops, and exercised the prerogatives of such. Where the sovereign, as in Saxony, was of a different confession from the majority of his subjects, the episcopal authority

was delegated to a minister. The bishoprics, however, were gradually secularized, and with the nominal or titular bishops of Osnabrück and Lubeck (1803) the old episcopal dignities became almost extinct on the Protestant soil of Germany. The Lutheran church, however, never formally abolished the office of B., and Melanchthon endeavored to get it expressly recognized. In Prussia, accordingly, the title of B. has had a fluctuating fate. The bishops in office at the time having acceded to the reformation in 1525, were continued; but in 1554 the revenues were confiscated, and the duties assigned to superintendents. In 1587, this last remnant of the episcopal office also disappeared; till Frederick I. conferred the title of B. on two of his court-preachers on occasion of his coronation. At their death it again ceased, and was not revived until at the peace-festival in 1816 Frederick William III. raised two clergymen to the dignity of bishops. One of them, the B. of Königsberg, received in 1829 the title of evangelical archbishop. Several have since received the title of B , along with that of superintendent-general, entitling them to the first place in the consistories, a certain civil rank, insignia, and salary. Of the other German states, only Nassau followed the example of Prussia, by naming in 1818 a B. for the united evangelical churches of the duchy. Elsewhere, the episcopal authority, mostly in very limited form, is exercised by consistories, ministries of worship, superintendents-general, inspectors, etc.

In the church of Scotland, and other Presbyterian churches on the Geneva model, the episcopal office is not recognized. Roman Catholic Scotland was divided into eleven dioceses or bishoprics.

In none of the Protestant countries have the prerogatives and revenues of bishops remained so little impaired as in England, where the reformation was taken into his own hands by the king, and being propagated from above downwards, was effected in a very conservative spirit. Episcopacy was abolished about the time of the commonwealth, but at the restoration the bishops were restored, and have since retained their position in church and state.

The practice and history of the church of England in the matter of bishops may be given somewhat more in detail. The B. is the head of the clergy in his diocese; he ordains them, whereby he calls them into existence as ecclesiastical persons; he institutes them to benefices, and licenses them to cures, and to preach; visits them, and superintends their morals; and enforces discipline, for which purpose he has several courts under him, and can suspend or deprive them for due cause.

Over the laity he exercises a general pastoral authority, but they are more particularly brought under his notice at the time of their confirmation. The style, title, and privileges of the B. are inferior to those of the archbishop (q.v.). He is said to be *installed* in his bishopric; he writes himself, "by divine permission;" and has the title of lord, and right rev. father in God; and he may retain six chaplains. A bishop must be at least 30 years of age; the reason for which is, that Christ began his ministry at that age. For many centuries after the Christian era, the B. received all the profits of his diocese, and paid salaries to such as officiated under him. The mode of election, confirmation, and consecration is the same in the case of bishops and archbishops, for each archbishop is also B. and has his own diocese. The B. is elected by the chapter of his cathedral church by virtue of license from the crown. The laity used to take part in the election, but from the tumults that arose, the different sovereigns of Europe took the appointment, in some degree, into their own hands by reserving to themselves the right of confirming these elections, and of granting investiture to the temporalities which now began to be annexed to these dignities. This right was acknowledged in the emperor Charlemagne by pope Hadrian I., 773 A.D., and the council of Lateran. The right of appointing to bishoprics is said to have been in the crown of England even in Saxon times. But when, by length of time, the custom of electing by the clergy only was fully established, the popes began to object to the usual method of granting these investitures, which was *per annulum et baculum*—i.e., by the prince delivering to the prelate a ring and pastoral staff or crosier. In the 11th c., pope Gregory VII. published a bull of excommunication against all princes who should dare to confer investitures. There were long and eager contests occasioned by this papal claim, but at length the matter was compromised, the emperor Henry V. agreeing to confer investiture for the future *per sceptrum;* and the kings of France and England consented to receive only the homage for the temporalities, instead of investing them by the ring and crosier, the pope keeping in his hands the power of confirmation and consecration. This concession was obtained from Henry I.; but king John, in order to obtain the pope's protection against his barons, gave up, by a charter to all monasteries and cathedrals, the free right of electing their prelates. This grant was confirmed in Magna Charta, and was again confirmed by statute 25 Edward III. But by statute 25 Henry VIII., the ancient right of nomination was in effect restored to the crown. The sovereign, on the vacancy being notified, sends to the dean and chapter a letter missive, or *congé d'élire*, containing the name of the person to be elected; and if they do not elect in the manner appointed by the act, or if the archbishop or B. appointed for the purpose refuse to confirm, invest, and consecrate the B. elect, the recusants incur the penalty of a *præmunire* (q.v.). A bishop is not consecrated more than once, and he cannot be *deposed*, as it is supposed that the order itself cannot

absolutely be taken from him; he may, however, be *deprived*, as was done to the B. of Clogher in 1822; he may also resign his see; and he may be removed from one see to another, which is called *translation;* but this practice is now less frequent than it used to be. The dean and chapter of Canterbury claim it as an ancient right of that church, that every B. of the province is to be consecrated in it, or the archbishop to receive from them a license to consecrate elsewhere; and it is said that a long succession of licenses to that purpose are regularly entered in the registry of that church. When elected and confirmed, a B. may exercise all spiritual jurisdiction, but he is not completely B. until consecration. Bishops, upon their election, become peers of the realm, and are summoned to the parliament as well as the other nobles; but the right under which they sit there, whether in respect of their baronies, or by usage and custom, is a matter of uncertainty. It appears, however, that the bishops sat in the Wittenagemote, under the Saxon monarchs, as spiritual persons; for they were not barons until William the conqueror turned their possessions into baronies, and subjected them to the tenure of knights' service. The bishops created by Henry VIII.—viz., Bristol, Gloucester, Chester, Oxford, and Peterborough, as also the lately created bishops of Ripon and Manchester—sit in parliament, though they do not hold their lands by baronial tenure. The bishops withdraw from the house (under protest, however) when any capital charge is to be decided. The bishops sit in parliament next to the archbishop of York; first, London; second, Durham; third, Winchester; and then the rest according to their ancienties. In respect of their persons, bishops are not peers with the nobility; and in cases of alleged crimes, they are tried by a jury in the same manner as commoners, as was the case with Cranmer and Fisher. When a see is vacant, the archbishop of the province is guardian of the spiritualities; but he cannot as such consecrate or ordain or present to vacant benefices. The sovereign has custody of the lay-revenues during a vacancy. Queen Elizabeth kept the see of Ely vacant 19 years.

All the bishops of a province, with respect to their archbishop, are called his suffragans; but originally this term denoted the bishops who were consecrated to assist and help the other bishops, and to supply their places when absent. They were also called *chorepiscopi*, or bishops of the country.

The B. of Durham had formerly a *palatine* jurisdiction, as it was called in the county of Durham; and the B. of Ely had a similar secular authority in certain places; but these powers were transferred to the crown in 1836. The houses of bishops are called their palaces. In old times their palaces in London were extra-diocesan; and while residing there, they exercised jurisdiction in the same manner as in their own dioceses. This personal privilege is now extinct in the bishops; but Lambert house, Croydon, Winchester place, and Ely house retain the privilege. A bishop makes a triennial visitation of his diocese.

The conferring of orders rests, in a great measure, with the discretion of the bishop. He can refuse to ordain without giving any reason, but he can ordain no person who does not subscribe to the queen's supremacy, the book of Common Prayer, and the 39 articles. A candidate for orders must be first examined and approved; and the person to whom the right of performing this duty belongs, is by the canon law the archdeacon of the diocese. A B. may give letters dimissory to another B., licensing the latter to ordain a candidate. No person under 23 can be ordained deacon, and none can be ordained priest under 24 years of age. See ORDINATION.

In England, there are 30 bishops, including the two metropolitans—viz., Canterbury, York, London, Durham, Winchester, Bangor, Rochester, Exeter, Peterborough, St. David's, Worcester, Chichester, Lichfield, Ely, Oxford, St. Asaph, Manchester, Hereford, Chester, Llandaff, Lincoln, Salisbury, Bath and Wells, Carlisle, Gloucester and Bristol, Ripon, Norwich, Sodor and Man, Truro, St. Albans. Two of these, the B. of Sodor and Man, and the junior of the rest (provided he be not an archbishop, or bishop of London, Durham, or Winchester), have no seat in parliament.

In Ireland, there are 12, including the two metropolitans, whose sees stand first—viz., Armagh and Clogher, Dublin and Kildare, Meath, Killaloe, Kilfenora, Clonfert and Kilmacduagh, Tuam, Killala, and Achonry; Ossory, Ferns, and Leighlin; Cashel, Emly, Waterford, and Lismore; Down, Connor, and Dromore; Derry and Raphoe, Limerick, Ardfert, and Aghadoe; Kilmore, Elphin, and Ardagh; Cork, Cloyne, and Ross.

In British North America, there are 10 sees; in the West Indies, 4; in South America, 1; in Africa, 6; in Asia, 6; in Australasia, 12; and in Europe, 1—that of Gibraltar; besides missionary bishops and the B. at Jerusalem. There are 7 bishops of the Episcopal church in Scotland. In the United States, there are 39 bishops of the Protestant Episcopal church.

There are an archbishopric and 13 Roman Catholic bishops in England. In Ireland there are 4 Catholic archbishops and 28 bishops. The Roman Catholic hierarchy in Scotland was formally restored in 1878, and has 2 archbishops and 4 bishops. The assumption of territorial titles by Roman Catholic bishops in England and Scotland is illegal, but they are, nevertheless, commonly ascribed to them by members of that communion. See Hooker's *Ecclesiastical Polity*, Burn's *Ecclesiastical Law*, Cripp's *Laws of the Church*, and *Blackstone*. See also ARCHBISHOP.

BISHOP (*ante*). In the Protestant Episcopal church in the United States, the functions of bishops, in religious matters, are similar to those of English prelates. In political affairs they have, of course, no official power. They are chosen to office by the convention of clerical and lay delegates in the diocese over which they are to preside; and are consecrated by the house of bishops, according to rules established by the general convention, which consists of the house of bishops and a second house of clerical and lay delegates from all the dioceses. There are 61 diocesan and missionary bishops. In the Methodist Episcopal church, the bishops are elected by the general conference. Their duties are those included in a general superintendence of the whole church. Authority is vested in them all, and its administration is distributed among themselves by mutual agreement. They preside over meetings of the annual conferences, ordain ministers, and appoint them to their fields of labor. The oldest in office is honored as "senior bishop."

In the Roman Catholic church in the United States, bishops are appointed by the pope, as in other countries, and are subject to him.

BISHOP, a favorite beverage composed of red wine (claret, Burgundy, etc.) poured warm or cold upon ripe bitter oranges, sugared and spiced to taste, and drunk either hot or cold. The quality of the B. depends upon the excellence of the wine employed in its preparation. The oranges must be carefully selected, and the white part between the peel and pulp must be thrown away. If white wine be used, the beverage is called *cardinal;* and with Tokay it becomes *pope.* Taken in moderation, B. is a wholesome drink; but if partaken of too freely, the ethereal oil contained in the orange-peel is apt to occasion headache. The beverage was known under other names in Germany during the middle ages, having been imported into that country from France and Italy; its present name seems to have been bestowed during the 17th century.

BISHOP, Boy. See Boy Bishop.

BISHOP, Anna, wife of the composer, sir Henry Rowley, B., and herself an eminent operatic and classical singer. Her first appearance was in 1837, and she soon became widely known in Europe and America. In 1858, she married Mr. M. Schultz, of New York.

BISHOP-AUCKLAND, a t. in England, 11 m. s.w. of the city of Durham, on an eminence near the confluence of the Wear and Gaunless; well paved, lighted, and watered. The palace of the bishop of Durham, at the n.e. end of the town, is a spacious and splendid though irregular structure. The site was chosen in the time of Edward I. by bishop Anthony Beck. The present buildings cover five acres, and there is a park attached of 800 acres. The industries of the town are cotton manufactures and engineering. Pop. '71, 8736.

BISHOP, Sir Henry Rowley, an eminent English composer of music, was b. in London in 1780. His principal musical instructor was Signor Francisco Bianchi, an opera composer settled in London. In 1806 B. was appointed composer of ballet music at the opera. His most popular operatic entertainments were *Guy Mannering; The Slave; The Miller and his Men; Maid Marian; Native Land; The Virgin of the Sun;* etc.—all remarkable for their long flowing melodies, animated style, and true musical power. From 1810 to 1824, he was director of the music at Covent garden theater. One of the first directors of the philharmonic society, he for many years conducted the concerts of ancient music. He arranged several volumes of the *National Melodies,* and succeeded sir John Stevenson as arranger of the airs selected by Moore for his *Melodies.* In June, 1839, he received the degree of bachelor of music from the university of Oxford, and in Nov., 1841, was elected Reid professor of music in the university of Edinburgh. In 1842, he was knighted. In Dec., 1843, he resigned his Edinburgh chair, and in Feb., 1848, was elected professor of music in the university of Oxford. In his later years he was in very necessitous circumstances. He died April 30, 1855.

BISHOP'S CASTLE, a t. in the s.w. of Shropshire, 19 m. s.w. of Shrewsbury. It is irregularly built on a hill slope. Pop. '71, 2091. The bishops of Hereford had formerly a castle here, now destroyed. During the civil wars of the 17th c., the inhabitants took shelter in the church, which was demolished over their heads.

BISHOP'S STOREFORD, a t. of Hertfordshire, on the Stort, 10 m. e.n.e. of Hertford. It chiefly consists of two streets in the form of a cross. It carries on a trade in grain and malt, and has several tan-yards. B. S. was in Saxon times the property of the bishops of London. Pop. '71, 6250.

BISHOP'S WALTHAM, a t. of Hampshire, about 10 m. e.n.e. of Southampton. Pop. of parish (1871), 1939. Corn, leather, and malt form the chief trade of the town. It has been immemorially the property of the see of Winchester. There are the remains of a bishop's castle, built in 1135 by Henry de Bloisking, king Stephen's brother, and which was reduced to ruins during the civil wars of the 17th century. A gang of "Waltham Blacks," or deer-stealers, infested the forest in this vicinity in the early part of the 18th century. The *Black Act* (q.v.) was passed in 1723, to put them down.

BISIGNA'NO, a t. of Italy, in the province of Cosenza, is situated on a hill near the junction of the Mucone with the Crati, about 15 m. n. of the town of Cosenza. It has a

cathedral, a castle, and a trade in silk, and gives the title of prince to the existing branch of the Sanseverino family. Pop. 4096.

BIS'KARA, or BISKRA, a t. in Algeria, and the most important military post of the Sahara, on the s. side of the Aures mountains. A large caravan trade between the Sahara and the Tell passes through the town. Iron, limestone, and saltpeter are found; dates are abundant; and there are manufactures of carpets. Near by is an acclimatization garden, established by the French. Pop. '72, 7867.

BIS'LEY, a t. of Gloucestershire, 11 m. s.e. of Gloucester. Pop. of parish (1871), 4985. The chief manufacture is coarse clothing. The church contains some interesting monuments, a cross-legged knight in armor, and an ancient stone font. There is also an ancient octagonal stone cross in the church-yard. The canal uniting the Severn and the Thames passes through the parish, the highest part being 370 ft. above sea-level.

BISMARCK-SCHOENHAUSEN, OTTO EDUARD LEOPOLD, Prince von, chancellor of the German empire, now the most prominent man in Europe, was b. in 1813 at Brandenburg, of an old family, of which various members have gained a reputation both as soldiers and statesman. B. received his university education at Göttingen, Berlin, and Greifswald, where he studied law. After he had finished his studies, he lived for a time on his estates. Before 1847, he was little heard of, but about that time he began to attract attention in the Prussian parliament as an ultra-royalist, and an advocate of the extremest absolutism. He was one of those who opposed the scheme of a German empire, proposed by the German parliament of 1849. His diplomatic career commenced in 1851, when he was appointed chief secretary of the Prussian legation, at the resuscitated German diet at Frankfort. Here he began to manifest that zeal for the interests and aggrandizement of Prussia, which has since undeviatingly guided him, often regardless of the means. In the diet, he gave open expression to the long-felt discontent with the predominance of Austria, and demanded equal rights for Prussia. In St. Petersburg, whither he was sent in 1859, he is said to have tried to bring about an alliance between France, Prussia, and Russia, but without success. By this time he had acquired the special regard and confidence of the king, who sent him, in the spring of 1862, as ambassador to Paris, in order to give him an insight into the politics of the Tuileries, before taking the direction of affairs at home. In autumn, when the king's government could not obtain the consent of the lower house to the new military organization, B. was recalled, to take the portfolio of the ministry for foreign affairs, and the presidency of the cabinet. Not being able to pass the reorganization bill and the budget, he closed the chambers (Oct., 1862), announcing to the deputies that the king's government would be obliged to do without their sanction. Accordingly, the army reorganization went on; and the next four sessions of parliament were closed or dissolved in the same way, without the government obtaining, or even caring to obtain, the sanction of the house. The people were now looking for a *coup d'état*, and the government for a revolution. At this crisis, the death of the king of Denmark opened up again the Slesvig-Holstein question, and excited a fever of national German feeling, which B. was adroit enough to work so as to aggrandize Prussia by the acquisition of the duchies, and reconcile his opponents to his high-handed policy by being able to point to the success of the newly-modeled army. Throughout the events which ended in the humiliation of Austria and the reorganization of Germany under the leadership of Prussia (see GERMANY, in SUPP., Vol. X.), B. was the guiding spirit; and such is the magic of success, that, from being universally disliked, he has become the most popular man in Germany. What is perhaps still stranger, the man who, of all others living, has been the most strenuous upholder of absolutism, and has all along manifested the strongest contempt for public opinion, received, in 1871, the thanks and congratulations of the extreme democrats of Great Britain for giving to North Germany a constitution based on universal suffrage. It was B. that negotiated the neutralization of the Luxemburg territory (1867). The action of France in regard to the candidature of prince Leopold of Hohenzollern for the throne of Spain gave B. the opportunity of carrying into action the intensified feeling of unity amongt Germans. During the war of 1870–71, B. was the spokesman of Germany; he it was that, in Feb., 1871, dictated the terms of peace to France. He was soon created a prince and chancellor of the German empire. The most striking feature of his administration has been a contest with the Catholic church, in which the expulsion of the Jesuits (July, 1872), and the carrying out of the new ecclesiastical laws, were the most prominent events. His life was attempted in 1874. He presided at the Berlin congress of 1878. His recent financial schemes, including a tobacco monopoly and the extension of the protective system, have met with strong opposition from the national-liberal party. In social life, B. is genial and witty. The work *B. und seine Leute*, by Dr. Busch (1878), contains many facts and amusing incidents, throwing light on the chancellor's character and manners.

BISMUTH is a brittle metal of a crystalline texture, and of a white color tinged with a faint red hue. It is found native in Cornwall, Germany, France, and Sweden, where it occurs in veins or fissures passing through other rocks. The principal natural source is an impure metal; but it is likewise found in combination with oxygen, sulphur, and arsenic. The pure metal is generally obtained by heating the impure native B. in iron

tubes in a furnace, when the metal volatilizes, and the vapor, condensing into a liquid in a somewhat cool part of the tube, runs into a receiving-vessel, and is ultimately transferred to molds, where it solidifies with a crystalline texture. B. is represented by the chemist by the symbol Bi; has the atomic weight or equivalent of 213, and has the specific gravity of 9783 to 9833 (water=1000). The metal B. is seldom employed by itself in the arts. The alloys of B. are of considerable commercial importance. In combination with tin, B. forms an alloy possessing great sonorousness, and therefore suitable for bells. The alloy of 8 of B., 5 of lead, and 3 of tin, readily fuses at 202° F., and therefore melts in boiling water; and the alloy of 2 of B., 1 of lead, and 1 of tin, at 200.75° F. Either of the latter alloys is entitled to the term *fusible alloy*, and when mixed with some mercury, becomes still more fusible, and may then be used in forming molds for toilet-soaps, and in taking casts.

B. forms several compounds of service in the arts and in medicine; it combines with oxygen to form several oxides, of which the teroxide (BiO_3) is the most important. It may be prepared by evaporating the solution of the ternitrate of B. ($BiO_3,3NO_5$) to dryness, and then heating, when the nitric acid ($3NO_5$) escapes, and leaves the teroxide of B. (BiO_3) as a yellowish powder. It is employed in the porcelain manufacture as an agent for fixing the gilding, and for increasing the fusibility of fluxes, at the same time neutralizing the colors which are often communicated by them. The ternitrate of B. is prepared by acting upon the metal B. with a mixture of one part of commercial nitric acid and one part of water, and applying heat. The subnitrate or basic nitrate of B. receives the names of *Pearl White*, *Pearl Powder*, *Blanc de Fard*, *Blanc d'Espagne*, *Majestery of B.*, and *Perlweiss* and *Schminkweiss* (German). It is used as a cosmetic, but is apt to become gray in tint, and even brown or black, when sulphureted hydrogen, often evolved from sewers, cesspools, and drains, comes in contact with it.

The subnitrate of B., the only medicinal preparation formed from this metal, acts as a local irritant and caustic poison on animals. On man, when given in small doses, it acts locally as an astringent, diminishing secretion. On account of the frequent relief given by it in painful affections of the stomach, where there is no organic disease, but where sickness and vomiting take place, accompanied by cramp or nervous disorder, it is supposed to act on the nerves of this viscus as a sedative. It has also been denominated tonic and antispasmodic. Vogt says, that when used as a cosmetic, it has been known to produce a spasmodic trembling of the face, ending in paralysis.

BISON, a name given by the ancients to an animal of the same genus with the ox (q.v.), still called the B., or the European B. (*bos bison* of some naturalists, *bos urus* of others) also known as the aurochs (Germ., wild animal or wild ox). This animal at one time abounded in most parts of Europe, but is now found only in the forests of Moldavia, Wallachia, Lithuania, and Caucasus. Herds of bisons, carefully protected by the emperor of Russia, and believed to amount to about 800 in all, roam through the great forest of Bialowieza, in Lithuania. The B. differs from all varieties of the common ox, in the arched line of the back, which rises in a sudden elevation behind the neck; the hump which is formed not consisting, however, of mere fat, but in great part of the very thick and strong muscles which support the large head. It is remarkable for strength in the fore-parts, and trees of 5 or 6 in. in diameter cannot withstand the thrusts of old bulls. It is capable of repelling all the attacks of the wolf or bear, rushing upon, overthrowing, and then trampling an adversary. Its horns are short, tapering, very distant, spreading, a little curved inwards at the point. They are affixed not at the extremities of the most elevated salient line of the head, as in the ox, but considerably in front of it. The figure of the forehead differs also from that of the ox in its greater breadth, and in its convex profile. Another important anatomical difference is in the number of ribs, of which the B. has 14 pair, whilst the ox has only 13; and the vertebræ of the tail are fewer, being only 19 instead of 21. The hair of the forehead is long and shaggy; that under the chin and on the breast forms a sort of beard: and in winter the neck, hump, and shoulders are covered with long woolly hair, of a dusky brown color, intermingled with a short, soft, fawn-colored fur. This long hair is gradually cast in summer. The legs, back, and hinder-parts are covered with short dark-brown hair. The tail terminates in a large tuft. The females are not so large as the males, nor do they exhibit the same shagginess of the fore-parts. The B. is the largest quadruped now existing in Europe, although within the historic period there appears to have existed along with it an ox exceeding it in size; and it appears to have been this ox, and not the B., which was called *urus* (q.v.) by the ancients, although their *bonasus* (or *bonassus*) was probably the same with the bison.—The food of the B. consists of grass and brushwood, and the leaves and bark of young trees. Its cry is peculiar, "resembling a groan or a grunt, more than the lowing of an ox." It does not attain its full stature till after its sixth year, and lives for about 30 or 40 years. The period of gestation appears to be the same with that of the ox. The B. has never been reduced to subjection by man, and the domestication even of individuals taken young, has been very partial. It generally shows a great aversion to the domestic ox. The common statement, however, that the B. calf invariably refuses to be suckled by the domestic cow, is contradicted on the excellent authority of the master of the imperial forests in the Russian government of Grodno.—The B. is generally very shy, and can only be approached from the leeward,

its smell being very acute. It is easily provoked, and is not approached without danger. It runs very swiftly, although it cannot long continue its flight, galloping with its head very low, so that the hoofs are raised higher than the head.

There is no historical evidence that the B. ever existed in Britain; but remains of this, or of a very closely allied species, are found in pliocene fresh-water beds in several parts of England, as well as on the continent of Europe. The size of these B. bones is, however, so great as of itself to cause a doubt of the identity of the species, and the horns are longer in proportion. The fossil B. has been called *bison priscus; bison* being by some naturalists separated as a genus from *bos*, upon the ground chiefly of the osteological differences in the head.

The American B. (*bos Americanus* of some naturalists, *B. bison* of others) is interesting as the only species of the ox family indigenous to America, except the musk ox (q.v.) of the subarctic regions. It is commonly called *buffalo* by the Anglo-Americans, although it is very different from the buffaloes (q.v.) of the old world. It is found in vast numbers in the great prairies between the Mississippi and the Rocky mountains; it occurs as far n. as the vicinity of Great Marten lake, in lat. 63° or 64°; extensive level and marshy tracts there affording suitable food, although it is nowhere else to be met with in so high a latitude. Its southern limit appears to be in New Mexico. It is comparatively rare to the w. of the Rocky mountains, and appears to have been rare to the e. of the Appalachians, even on the first settlement of Europeans. Within the present century, however, it was found in the western parts of the state of New York, and in large numbers in that of Ohio; but it has now disappeared from the whole region e. of the Mississippi, and it is necessary to advance about 100 m. to the westward of that river before considerable numbers are anywhere to be found. In the western prairies enormous herds still congregate; great plains are sometimes spotted and darkened with them as far as the eye can reach; "countless thousands" are described as coming to refresh themselves in stagnant pools; and their paths are said to be, in some parts of the wilderness, as frequent and almost as conspicuous as the roads in the most populous parts of the United States.

About 300,000 Indians are supposed to subsist almost entirely on the flesh of the B. The spear and the bow and arrow are still much employed by them in hunting it, although many of them also use fire-arms. They frequently pursue it on horseback; but the hunter, whether on horseback or on foot, has often much difficulty in getting within shot, upon account of its keenness of scent, and the speed with which it runs. The chase of the B. is also very dangerous, as it is apt to turn upon an adversary, and even a fleet horse cannot always escape it. Great numbers, however, are sometimes killed when the hunters can succeed in throwing the herds that are scattered over the plains into confusion, so that they run wildly, without heeding whither. Another expedient of the Indians is to set fire to the grass of the prairies around them, when they retire in great consternation to the center, and are easily killed. A sort of pound or inclosure is sometimes made, with a long avenue leading to it, and an embankment of snow, such, that when the animals have descended over it they cannot return, and by this means great numbers are often captured and killed. Livingstone describes a similar expedient as in use for killing wild animals in South Africa. Sometimes, also, the Indians contrive to throw them into consternation, and to make them run towards a precipice, over which many of the foremost are driven by the crowds which throng up behind.

The American B. is very similar to the European. In general, it is of rather smaller size, but this does not appear to be always the case, and it is said sometimes to attain a weight of 2000 lbs. Its limbs and tail are shorter, and the tail consists of fewer vertebræ. The horns are shorter and more blunt. The fore-parts are still more shaggy, and retain more of their shagginess in summer. The ground upon which many naturalists have rested their chief confidence of specific difference has been, however, the presence of an additional pair of ribs, the American B. being said to have 15 pair; but Mr. Vasey has recently ascertained that, like the European B., it has only 14. The more gregarious habit may perhaps be accounted for, like that of the American beaver, by difference of circumstances.

The wolf is quite unable to contend with the B., but many wolves often hang around the herds, to devour calves which may stray, or aged animals which have become too weak to keep up with the rest. These have sometimes been seen assailed by whole packs of wolves, and dealing death to many of their assailants, before they were compelled to yield to numbers and hungry pertinacity. The only American animal that is singly capable of overcoming the B. is the grisly bear. See BEAR.

The flesh of the B. is very good, and differs from that of the ox in having a sort of venison flavor. The hump, in particular, is esteemed a delicacy.—*Pemmican* (q.v.), so much the food of fur-hunters and northern *voyageurs*, is made of the flesh and fat of the bison.—The tallow forms an important article of trade. One bull sometimes yields 150 lbs. The skins are much used by the Indians for blankets, and, when tanned, as coverings for their lodges and beds. A blanket of B.'s skin is not unfrequently sold for three or four pounds sterling in Canada, to be used as a traveling cloak or wrapper. The Mandan Indians make canoes of B. skins spread upon wicker-work frames. These canoes have the round form of the Welsh *coracle* (q.v.). The long hair or fleece is spun

and woven into cloth; and some of it which has been brought to England has been made into very fine cloth: stockings, gloves, etc., are also knitted of it. A male B. yields from 6 to 8 lbs. of this long hair.

The few attempts that have been made to domesticate the American B., have been so far successful, that they afford encouragement to further experiments. The size and strength of the animal make it probable that, if domesticated, it would be of great use.

BISSA'GOS, or BIJU'GA ISLANDS, a group of small volcanic islands, about 20 in all, off the w. coast of Africa, in lat 10° 2′ to 11° 42′ n., and long. 15° to 17° w., opposite the mouth of the Rio Grande. The islands are inclosed by a reef, and, with a few exceptions, are thickly wooded. Many of them appear to be densely peopled by a savage, thievish negro race, who cultivate maize, bananas, and palms, and feed cattle and goats, which constitute their chief wealth. There are several fine ports. On one of the islands, Bulama, the British formed a settlement in 1792, but were obliged to abandon it the following year, on account of its unhealthiness. Bissao, one of the group, on which there is a Portuguese settlement, has a pop. of 8000. It carries on a large trade in slaves, nearly all its European inhabitants being engaged in the traffic. It has also a trade in rice, wax, hides, etc., and imports annually about £20,000 worth of British manufactured goods.

BISSELL, WILLIAM H., 1811–60; a graduate from Jefferson medical college in 1835, who practiced in New York state. In 1837, he went to Illinois, and was in the legislature in 1840; afterwards studied law and became prosecuting attorney. He was a col. in the Mexican war; elected to congress in 1849, and while there had a sharp discussion with Jefferson Davis about the bravery of northern and southern soldiers, which provoked Davis to send him a challenge. B. accepted, chose muskets for the weapons, and prescribed a distance that would in all probability insure death for both. There was no duel, the challenge being withdrawn after some interference of friends. In 1856, he was chosen governor of the state.

BISSEN, WILHEM, a distinguished Danish sculptor of the present century was b. near Slesvig in 1798, and studied his art for 10 years in Rome, under the guidance of his countryman, Thorwaldsen. Returning home, he executed a number of excellent works (a bust of Oersted, Atalante hunting, etc.). In 1841, he returned to Rome, being commissioned by the government to make 18 statues larger than life. Along with these he produced a Venus, and a charming piece, "Cupid sharpening his Arrow." Being recalled to Copenhagen, he was commissioned to execute a frieze of several hundred feet long for the great hall of the palace, representing the development of the human race according to the Greek mythology. Thorwaldsen, in his will, appointed B. to complete his unfinished works and have charge of his museum. In 1850, he was made director of the academy of arts, Copenhagen. At the Paris exhibition in 1855, he was the only sculptor who represented Danish art. He died in 1868.

BISSEXTILE, the old name of leap year. In the Julian computation a day was added to February every fourth year, but instead of making it as now the 29th, the 24th day of the month was counted twice (*bis*), and as that day was the sixth (*sexto*) before the calends of Mar. it was called *bis-sextile*.

BISTORT, *Polygonum bistorta*, a perennial plant, 1 to 1½ ft. high, with a simple stem, ovate subcordate and wavy leaves, the radical leaves tapering into a long footstalk, and one dense terminal cylindrical spiked raceme of flesh-colored flowers. The root is about the thickness of the little finger, blackish brown externally, reddish within, and tortuous (whence the name bistort). The whole plant is astringent, containing much tannin; the root is one of the strongest vegetable astringents, and is much employed in medicine, both internally and externally, in hemorrhages and many other complaints. B. is a native of meadows in Europe, and is found in Britain, but is by no means common. See POLYGONUM.

BIS'TRE, or BIS'TER, is a pigment of a warm brown color, prepared from the soot of wood, especially beech. It is used in water-colors after the manner of Indian ink.

BISTRITZ, a fortified t. of Transylvania, beautifully situated on the Bistritz river, in a fine valley about 50 m. n.e. of Klausenburg. In its vicinity are the remains of an ancient castle, once the residence of the illustrious Hunyads. It has several large cattle-fairs, but the extensive general trade it once carried on is now entirely gone. Forming, as it does, the last strong position in the n.e. of Transylvania, it was repeatedly during 1848–49 the scene of hot strife between the Hungarian and Austrian generals. Pop. '69, 7212. B. is also the name of a river which, rising in e. Hungary, flows s.e. through Bukowina and Moldavia, and joins the Sereth near Baku, after a course of 110 m., and is called the Golden B., on account of the auriferous character of its sands.

BISULNUG'GUR, or BISANAGAR, a t. of India, in Guzerat, in the territories of Guicowar, 82 m. n.w. of Mhow. It has a large transit trade, and manufactures cotton cloths. Pop. 18,000.

BISULPUR', or BESULPORE, a t. of India, in the British district of Bareilly, n.w. provinces. It is 24 m. s.e. from Bareilly. It has a good bazaar, and is abundantly supplied with water. Pop. '71, 9005.

BIT, or BITT, in ship-building, is a frame composed chiefly of two short but strong vertical timbers, fixed into or upon the deck in the fore-part of the vessel. Its main purpose is for fastening the cable when the ship rides at anchor, and for "leading" the principal ropes of the rigging. To "bit the cable," is to fasten it around the bit. Various kinds are called "riding-bits," "Elliott's bits," "Carrick-bits," "paul-bits," "jeer-bits," "topsail-sheet-bits," etc. Having to resist great strains, the bits are strongly bolted to the beams that support the deck.

BITCHE, a German t. of Alsace-Lorraine, in a wild and wooded pass of the Vosges, about 16 m. e.s.e. of Sarreguemines. Its citadel, which is built on a precipitous and isolated rock, in the middle of the town, is well supplied with water, defended by 80 cannon, has accommodation for a garrison of 1000 men, and is considered all but impregnable. The Prussians under the duke of Brunswick attempted to surprise it in 1793, but failed. Pop. of town, 2456, who are engaged in the manufacture of matches, watch-glasses, and porcelain. The German spelling is *Bitsch*.

BITHOOR, a t. in India in the district of Cawnpore, and lieutenant-governorship of n.w. provinces, stands on the right bank of the Ganges, about 12 m. n.w. of Cawnpore itself. B., particularly devoted to the worship of Brahma, has numerous pagodas. It is, of course, a favorite resort for pilgrims, who here, as at Benares and Bindraban, have access to the sacred stream for purposes of ablution, by means of elaborately constructed ghauts. During the mutiny of 1857, B. acquired an unenviable notoriety as the stronghold of Nena Sahib. Here also Havelock more than once exacted retribution, however inadequate, defeating the Nena in the field, and burning his fort. B. in 1871 contained 8322 inhabitants.

BITHYNIA, an ancient division of Asia Minor, was separated from Europe by the Propontis (sea of Marmora) and the Thracian Bosporus (strait of Constantinople), and was bounded n. by the Euxine, and s. by Galatia, Phrygia, and Mysia. Its eastern limits were not very clearly defined, but they at least extended as far as Paphlagonia. It contained the famous Greek cities or colonies of Chalcedon, Heraclea, etc.; and at later periods, Nicomedia, Nicæa, and Prusa were flourishing cities of Bithynia. The inhabitants of B. were supposed to be of Thracian origin. The country was subdued (560 B.C.) by Crœsus of Lydia, and, five years later, fell under the Persian dominion. But about 440 or 430 B.C., it became an independent kingdom under a dynasty of native princes, who made Nicomedia their capital. The last king, Nicomedes III., made the Romans his heirs, and with a large addition from the Pontic kingdom, B. became a province of the empire (74 B.C.). Under Trajan, B. was governed by Pliny the Younger, whose letters to the emperor on the administration and condition of the province contain the well-known passage respecting the Christians. The emperor Diocletian made Nicomedia his habitual residence. In 1298, Osman the Turk broke into the country, and in 1328, Prusa or Brusa, then the chief town of B., became the capital of the kingdom of the Osmanli.

BITLIS, a t. of Asiatic Turkey, in the vilayet of Erzroum, in lat. 38° 24′ n., and long. 42° 5′ e., about 120 m. s.e. from Erzrum. It is situated at an elevation of 5156 ft. above the level of the sea, in a deep ravine traversed by the river Bitlis, one of the head streams of the Tigris. B. is a straggling, irregular place, covering a large surface of ground, and surrounded by bare limestone mountains, rising to a height of about 2000 ft. above the valley, which is filled with orchards and gardens, and watered by numerous streams and springs. It has 3 mosques, about 12 convents belonging to the howling dervishes, who appear to have made B. their head-quarters, several well-stocked bazaars, and extensive manufactures of cotton cloths, which are celebrated for their bright red dye. It has also a very extensive trade. The import of British goods is small. The population consists of about 2000 Mohammedan and 1000 Armenian families. The Persians defeated Solyman the Magnificent near B. in 1554.

BITONTO (ancient *Butuntum*), a t. of Italy, in the province of Bari, and 10 m. w.s.w. of the city of Bari. It is situated in a fruitful plain about 5 m. from the sea, is well built, is, conjointly with Ruvo, the see of a bishop, and has a fine cathedral, monasteries, and a nunnery. Pop. 23,000, who carry on an extensive trade in a wine called *Zagarello*, which is largely cultivated in the environs. B. is the birthplace of Giordani, the mathematician. In its vicinity, the Spaniards, under count de Montemar, gained a splendid victory over the Austrians on the 25th of May, 1734, the result of which was that Spain re-obtained possession of the kingdom of Naples.

BITTERFELD, a t. in Saxony, 17 m. n. of Leipsic, at the junction of the Lober and the Mulde; pop. '71, 5043. It has foundries, breweries, and various other manufactories. B. was founded in the 12th c. by the Flemings.

BITTENFELD, HERWARTH VON, a Prussian gen., one of the three leaders that commanded the invasion into Bohemia in 1866. B. was b. in 1796, and gained his first martial laurels in the war of liberation, especially in the battle of Leipsic. In the year 1848, he commanded the first regiment of the guards. In 1863, raised to the rank of gen., he acquired great fame through his daring crossing of the Sund, and capture of the isle of Alsen. In the campaign of 1866, he was intrusted with the occupation of Saxony, and then with the command of the army which advanced from Saxony into

Bohemia. He contributed largely to the brilliant victories of Hünerwasser, Gitschin, Münchengrätz, and Königgratz. On the outbreak of the war in 1870, B. was made governor of the Rhine provinces; and in the next year he was raised to the rank of general field-marshal. In the war of 1866, one of his sons fell; in that of 1870, two were killed.

BITTER CRESS. See CRESS.

BITTER KING, *Soulamrea amara*, a shrub or small tree of the natural order *polygalaceæ* (q.v.), a native of the Indian archipelago, which has received its name from its intense bitterness. The genus differs from the usual structure of the order in its regular flowers. The B. K. has large oval leaves and axillary racemes of flowers. It is used medicinally in fevers and other diseases.

BITTERN, *Botaurus*, according to some modern ornithologists, a genus of the heron (q.v.) family (*ardeinæ*); but regarded by others as a mere sub-genus of heron (*ardea*), and not a very well defined one. Bitterns are indeed chiefly distinguished from herons by the long, loose plumage of the neck, which they have the power of erecting at pleasure, along with the rest of their clothing feathers, so as greatly to increase their apparent size. The back of the neck, however, is merely downy, or almost bare, the long feathers being on the front and sides. Bitterns also differ from herons in the greater length of their toes, the middle toe being as long as the shank. They are almost all solitary birds, inhabiting reedy and marshy places, where they lie hid during the day, and will almost allow themselves to be trodden upon ere they take wing; they feed during the night, and then, also, often rise spirally to a great height into the air, and emit loud resounding cries. Their food consists chiefly of frogs, and partly, also, of fish, lizards, water-insects, etc., and even of small birds and quadrupeds. The claw of the middle toe is serrated on the inner edge, probably to aid in securing slippery prey. —The COMMON B. (*B. stellaris*, or *ardea stellaris*) is a bird very widely diffused over the old world, being found in almost all, at least of the temperate, parts of Europe, Asia, and Africa, which are sufficiently marshy for its manner of life. It is now rare in Britain, owing to drainage; but was formerly more common, and in the days of falconry, was carefully protected by law in England, on account of the sport which it afforded. Its flesh also was in high esteem, and is not rank and fishy, like that of the herons generally. In size, it is rather less than the common heron; the bill is about 4 in. long, the feathers on the crown of the head are greenish black, and the plumage in general of a dull yellow color, beautifully and irregularly marked and mottled with black. The B. makes a rude nest of sticks, reeds, etc., in its marshy haunts, and lays four or five greenish-brown eggs. It has a peculiar bellowing cry, which has obtained for it such English provincial names as mire-drum, bull of the bog, etc., and many of its appellations in other languages, perhaps even its name B. (*bitour, botur, botaurus*). Some naturalists used to assert that the booming cry of the B. was produced by the bird inserting its bill into a reed; that notion, however, has long since been exploded. When assailed, it fights desperately with bill and claws; and it is dangerous to approach it incautiously when wounded, as it strikes with its long sharp bill, if possible, at the eye. —The LITTLE B. (*B. minutus*, or *ardea minuta*) is common in some parts of Europe, but rare in Britain. Its whole length is only about 13 in.—The AMERICAN B. (*B. lentiginosus*, or *A. lentiginosa*), a species almost equal in size to the common B., and very similar to it in habits and voice, has occasionally been shot in Britain. It is common in many parts of North America, migrating northward and southward, according to the season. The crown of the head is reddish brown, and the colors and markings of the plumage differ considerably from those of the common B.—The LEAST B. (*B.* or *A. exilis*) is another North American species, of very small size, which is also migratory, and somewhat social in its habits. The AUSTRALIAN B. (*B.* or *A. australis*) is generally diffused throughout Australia, wherever marshes or sedgy rivers occur. In habits it closely resembles the B. of Europe. The head and upper parts generally are purplish brown, except the wings, which are buff, conspicuously freckled with brown; the throat, breast, and belly mottled brown and buff.

BITTERN, BITTER LIQUID, or SALT OIL, is an oily liquid obtained during the preparation of common salt (q.v.). When the mother-liquor of the evaporating pans ceases to deposit crystals of common salt, there is left behind in the boilers the material called bittern. It consists principally of a strong solution of common salt, along with Epsom salts, and other compounds of magnesia.

The B. at our salt-works is generally run into tanks, and during winter, it is employed as a source of Epsom salts. The B. is treated with a little sulphuric acid, which converts the chloride of magnesium ($MgCl$) into sulphate of magnesia ($MgOSO_3$), and on the liquid being allowed to cool, the crystals of Epsom salts (or sulphate of magnesia) separate.

BITTER PRINCIPLES are extracts from various plants by maceration in water or other liquid. Some bitter principles can be crystallized, while the bitter of hops and wild cherry cannot be so treated. Some of the vegetable bitters are soluble in water, and some in alcohol, and their properties are usually neuter, having neither bases nor acids. There is a wide use of bitters as a tonic, but the great portion of those sold are merely a disguise for strong drink, and of no other use to the drinker.

BITTERS are prepared from an infusion of herbs containing bitter principles. The plant generally used for the purpose is *archangelica officinalis*, or the *garden angelica*. See ANGELICA. The roots or seeds, or both, are placed in water, and the whole is left to simmer for several drys, when the infusion will be strong enough. The B. from angelica are not much used by physicians, having been superseded very much by infusions of gentian, etc.; but they are still used as a household medicine in town and country by elderly people. The chemical composition of the root is:

Bitter extractive	27.06
Volatile oil	0.70
Acrid soft resin	6.02
Gum and common salt	31.75
Starch	5.40
Woody fiber	8.60
Albumen	0.97
Water and loss	19.50
	100.00

The medicinal properties of B. are mainly those of a mild tonic and pungent aromatic stimulant, and hence they are serviceable as a stomachic in cases of weakness of the digestive organs. The taste is at first sweetish, rapidly becoming hot, aromatic, and bitter, and the odor is rather pleasant. The angelica root yields a larger amount of the bitter principle than angelica seeds. Camomile flowers, coriander-seeds, and other vegetable tonics and stimulants, are occasionally employed in the preparation of bitters.

BITTER SPAR, a name given to dolomite (q.v.), from the magnesia contained in it, which the Germans call *bitter salt*.

BITTERSWEET, or WOODY NIGHTSHADE (*solanum dulcamara*), a plant found in hedges and thickets in Britain, and in most parts of Europe, also in Asia and in North America. The root is perennial; the annual stems climbing and shrubby, many feet in length; the leaves ovate-heart-shaped, the upper ones spear-shaped; the flowers purple, in drooping corymbs, much resembling those of its congener, the potato, but much smaller, followed by ovate red berries of tempting appearance, which, being poisonous, are not unfrequently the cause of serious accidents, particularly to children. The twigs, collected in autumn after the leaves are fallen, are used in medicine as a diaphoretic and diuretic, and as a remedy for leprosy and other cutaneous disorders. See SOLANUM.

BITTER VETCH. See OROBUS.

BITTERWOOD, a name given to certain species of the genus *xylopia*, trees and shrubs remarkable for the bitterness of their wood, particularly the West Indian *X. glabra*. Furniture made of this wood is safe from the attacks of insects.—The genus *xylopia* belongs to the natural order *anonaceæ* (q.v.). The fruit of some of the species, particularly *X. sericea*, is highly aromatic and pungent like pepper. *X. sericea* is a large tree, a native of Brazil; its bark is used for making cordage, which is excellent.

B. is also the name of *pierœna excelsa* (formerly *quassia excelsa*), a tree of the natural order *simarubaceæ* (q.v.), a native of Jamaica, the wood of which is used in medicine for the same purposes as quassia (q.v.), and often under that name; indeed, it is probable that all the present quassia of the shops is really this wood. It is, botanically, very nearly allied to the true quassia, and possesses very similar properties, containing the crystallizable bitter principle called quassite or quassin. The wood, which is intensely bitter, is a very useful stomachic and tonic; an infusion of it is a well-known and useful fly-poison; and it appears to act as a powerful narcotic on many quadrupeds.

BITUMEN, a mineral substance, remarkable for its inflammability and its strong peculiar odor; generally, however, supposed to be of vegetable origin. The name, which was in use among the ancient Romans, is variously employed, sometimes to include a number of the substances called *mineral resins* (see RESINS), particularly the liquid mineral substances called *naphtha* (q.v.) and *petroleum* (q.v.) or mineral oil, and the solid ones called *mineral pitch*, *asphalt* (q.v.), *mineral caoutchouc*, etc.; sometimes in a more restricted sense it is applied by mineralogists only to some of these, and by some mineralogists to the solid, by others to the liquid ones. All these substances are, however, closely allied to each other. Naphtha and petroleum consist essentially of carbon and hydrogen alone, 84 to 88 per cent. being carbon; the others contain also a little oxygen, which is particularly the case in asphalt, the degree of their solidity appearing to depend upon the proportion of oxygen which they contain, which amounts in some specimens of asphalt to 10 per cent. Asphalt also contains a little nitrogen. Bituminous substances are generally found in connection with carboniferous rocks, in districts where there is, or evidently has been, volcanic agency. See the articles already referred to. Indeed, most kinds of coal contain B., and a substance essentially the same is produced from all kinds of coal by distillation; and whether before existing actually formed in the coal, or produced at the time by the action of heat, B. may often be seen bubbling from pieces of coal after they have begun to burn on an ordinary fire. Some of the shales of the coal-measures are very bituminous, as is also a kind of marl-slate abundant in some parts of the continent of Europe. See SHALE and MARL.—One of the most interesting

of the bituminous minerals is that called *mineral caoutchouc* or *elastic B.*, and for which the new name of *elaterite* has been devised, as if to support the dignity of its exaltation to the rank of a distinct mineral species. It is a very rare mineral, only three localities being known for it in the world—the Odin lead-mine in Derbyshire; a coal-mine at Montrelais, near Angers, in France; and a coal mine near South Bury, in Massachusetts. It is elastic and flexible like caoutchouc, and may be used, like it, for effacing pencil-marks. It is easily cut with a knife. Its color is blackish, reddish, or yellowish brown; and its specific gravity is sometimes a little less and sometimes a little more than that of water. It has a strong bituminous odor, and burns with a sooty flame.

BITU'MINOUS COAL is a term applied to the varieties of coal which contain a large percentage of volatile matter. They yield, on their destructive distillation, a considerable quantity of gas, remarkably pure, and with good illuminating qualities, and are consequently largely used for that purpose. See COAL.

BITU'MINOUS LIMESTONES are limestones impregnated and sometimes deeply colored with bituminous matter, obtained from decaying vegetables, or, more probably, from the decomposed remains of those animals the hard parts of which form so large an amount of the rock.

BITU'MINOUS SHALES are indurated beds of clay occurring in the coal-measures, and containing such an amount of carbon and volatile matter that they are able to keep up combustion when mixed with but a little coal. They are indeed impure coal, with a large percentage of ash or earthy matter, which after burning retains the original form. See COAL.

BITZIUS, ALBERT, better known under the *nom de plume* of Jeremias Gotthelf, a Swiss author, was b. at Morat, in the canton of Freiburg, 4th Oct., 1797. He was educated for the church; and after holding several cures, was appointed, in 1832, pastor of Lützelflüh, in Emmenthal, canton of Bern, which office he retained till his death. His first work was entitled *The Mirror of Peasants* (Burgsdorf, 1836). It is the touching history of a poor villager, Jeremias Gotthelf, which pseudonym B. ever after retained. In 1838 appeared his *Sorrows and Joys of a Schoolmaster;* in 1839, *Dursli, the Brandy Drinker*, and *How Five Maidens Miserably Perish in Brandy;* in 1842–46, *Scenes and Traditions of the Swiss*, in 6 vols., in which B. narrates, with great art, the old national legends, among which the most remarkable is the *Reconciliation*. The best and most popular of his stories, however, are *Grandmother Katy* (Berlin, 1848); *Uli, the Farm-servant* (Berlin, 2d edition, 1850); and *Stories and Pictures of Popular Life in Switzerland* (Berlin, 1851.) Subsequently, he wrote several pamplets against the German democrats, without, however, violating those popular sympathies and liberal convictions which pervade his writings, and which at an earlier period led him to vehemently oppose the family government of the Bernese aristocracy. His last work was *The Clergyman's Wife*, which appeared in 1854. Its author died on the 22d Oct. of the same year. B.'s writings are greatly relished in Switzerland. They are characterized by simplicity, inventiveness, a wonderful fidelity in the delineation of manners and habits, great vigor of description, and raciness of humor, while their tone is strictly moral and Christian.

BI'VALVE SHELLS or BIVALVES are those testaceous coverings of mollusks which consist of two concave plates or *valves*, united by a hinge. So long as molluscous animals provided with shells were considered by naturalists almost exclusively with respect to these, the order of B. S., originally established by Aristotle, retained its place (see CONCHOLOGY); and indeed the external character upon which it is founded is closely connected with some of the important structural characters according to which mollusks are now classified. See MOLLUSCA. A vast majority of recent B. S. belong to Cuvier's *testaceous* order of *acephalous mollusca*, the *lamellibranchiate* (q.v.) *mollusca* of Owen, although with them are classed some which were placed among *multivalves* (q.v.) by conchologists on account of accessory valves which they possess, and some which have a calcareous tube superadded to the true valves, or even taking their place as the chief covering of the animal. There are also mollusks of the class *brachiopoda* (q.v.), *palliobranchiata*, which possess B. S., as the *terebratulæ*, or lamp-shells (q.v.), etc. The structure of the shell, however, when closely examined, is found to be different in these two classes (see SHELL), although its general appearance is much the same. A very large proportion of the B. S. of the older fossiliferous rocks belong to the class brachiopoda.

In the brachiopoda, one valve is ventral, and the other dorsal; in the *lamellibranchiata*, the one is applied to the right side, and the other to the left side of the animal. The valves of ordinary B. S consist of layers, of which the outermost is always the smallest; and each inner one extends a little beyond it, so that the shell becomes thicker and stronger as it increases in length and breadth. The valves are connected at the hinge by an elastic ligament; and in general this consists of two parts, more or less distinct—one on the outside, to which the name *ligament* is sometimes restricted, and which is stretched by the closing of the valves; another, sometimes called the *spring*, more internal, which is compressed by the closing of the valves, and tends to open them when the compressing force of the *adductor* muscle or muscles is removed, the effect of which is to be seen in the gaping of the shell when the animal is dead. The hinge is often

furnished with teeth which lock into each other; sometimes it is quite destitute of them; sometimes the hinge-line is curved, sometimes straight. Conchological classification has been much founded upon characters taken from this part. The valves of some B. S. are equal and symmetrical, in others they are different from one another, particularly in those mollusks which, like the oyster, attach themselves permanently by one valve to some fixed substance, as a rock. Sometimes the valves of B. S. close completely at the pleasure of the animal; those of others always gape somewhere.

The point at the hinge, from which the formation of each valve has proceeded, is called the *umbo*. On the side of the umbo opposite to the ligament there is usually a small depression called the *lunule*. The marks, familiar to every one, upon the inside of a bivalve shell, are the impressions of the *mantle* of the (lamellibranchiate) mollusk, and of the adductor muscle or muscles.

BIV'OUAC (from the German *beiwacht*, or *bewachen*, to watch over) is the encampment of soldiers in the open air, without tents, where every one remains dressed, and with his weapons by him. Even during the seven years' war it was no uncommon thing for the whole army, when in the vicinity of the enemy, to pass the night in their ranks, each lying down in his place, in order to be ready to stand to their arms at a moment's notice. But the French revolutionary armies introduced the practice of dispensing with tents altogether, and regularly passing the night *en bivouac*. Hence in a great measure that rapidity in their motions which long made them uniformly successful; and the practice was afterwards imitated by the other armies of Europe, though less by the English. Soldiers in B. light fires, and improvise, where it is possible, huts of straw, branches, etc. But this mode of encampment, though favorable to celerity of movement, is purchased at the expense of the soldiers' health, besides being destructive of discipline, by leading to plundering and destroying of houses, fruit-trees, etc., in the vicinity. Accordingly, the tent is again coming into use, and for permanent encampments, regularly constructed wooden huts have been introduced. There are still, however, many cases where the B. is the only resource.

BIXA. See ARNOTTO.

BIZER'TA, or BENZER'TA (ancient *Hippo Diarrhytus*, or *Zaritus*), a seaport t. of Tunis, at the bottom of a deep gulf or bay of the Mediterranean, and at the mouth of a lagoon, united to the gulf by a narrow channel. It is the most northerly town in Africa, being about 38 m. n.w. of Tunis, in lat. 37° 17′ n., and long. 9° 51′ east. It is surrounded by walls, and defended by two castles; which, however, as they are commanded by the neighboring heights, are quite useless against a land attack. Its port, formerly one of the best in the Mediterranean, has been suffered to fill up, until now only small vessels can be admitted, though very little labor is required to give a uniform depth of 5 or 6 fathoms to the channel leading to the inner harbor or lagoon, which has a depth varying from 10 to 50 fathoms, and is extensive enough to afford accommodation to the largest navies. The adjacent country is remarkably fertile, but its cultivation is neglected. Pop. variously estimated at from 8000 to 14,000. Agathocles, between the years 310 and 307 B.C., fortified and provided B. with a new harbor; and under the Romans, it was a free city.

BIZIU'RA. See MUSK DUCK.

BJÖRNEBORG, or BIORNBORG, a t. or city in Finland, on the gulf of Bothnia, 72 m. n. of Abo; pop. 7270; has export trade in tar, pitch, lumber, etc. It was wholly burned in 1801.

BJÖRNSON, BJÖRNSTJERNE, b. 1832 in Norway; poet and novelist, first known by articles in a newspaper, *Folkblad*, in which he published sketches and stories. Later he issued *Fædrelandet*, *Thrond*, *Arne*, and *Synnøve Solbakken*. His stories in English are *Arne*, *Ovind*, *The Fisher Maiden*, *The Fishing Girl*, *The Happy Boy*, *The Newly Married Couple*, *Love and Life in Norway*, and others of later date.

BJÖRNSTJERNA, MAGNUS FRIEDRICH FERDINAND, Count, a Swedish statesman and author, was born 10th Oct., 1779, at Dresden, where his father then resided as secretary to the Swedish legation. He received his education in Germany, and entered Sweden for the first time in 1793 to join the army. In 1813 he was appointed lieut. in the Swedish army that went to aid the allies in Germany; took part in the conflicts at Grossbeeren and Dennewitz; was present at Leipsic, and concluded the formularies of capitulation with the French at Lübeck and Maestricht. Subsequently, he fought in Holstein, and in Norway, where he concluded the treaty that united that country with Sweden. In 1826 he received the title of count; and in 1828 was appointed ambassador to the court of Great Britian, which office he held till 1846, when he returned to Stockholm, where he died 6th Oct., 1847. As a politician B.'s opinions were liberal. In addition to some political writings, he published a work on the theogony, philosophy, and cosmogony of the Hindus in 1843.

BLACAS, PIERRE LOUIS JEAN CASIMIR, Duc de, 1771–1839; a member of the cabinet of Louis XVIII., and one of the confidential advisers of the bourbons. As ambassador in Rome he negotiated the concordat of 1817, and was afterwards minister at Naples. At the overthrow of Charles X. he went into exile, offering to the unfortunate king his fortune, which, however, was not accepted.

BLACK may be considered as the negation of color, resulting from the absorption of the rays of light by certain substances. Painters produce it by an unequal combination of the three primary colors. In mediæval art, B. was symbolical of evil, error, and woe; thus we find Christ, when the old illuminators wished to represent him as wrestling against the spirit of evil, arrayed in black drapery; and Byzantine painters, to express the sorrow of the Virgin Mary, gave her a black complexion. "All faces shall gather blackness," is the expression of Joel, when he wishes to convey the idea of the trouble of the people when the calamities which, with prophetic eye, he sees brooding over Jerusalem, should come to pass. B. clothing among some oriental nations was regarded as a badge of servitude, slavery, or low birth; among the Moors, it has several significations —obscurity, grief, despair, constancy. B. in blazonry, under the name of sable, denotes constancy, wisdom, and prudence. For B. as a funereal color, see FUNERALS and MOURNING.

BLACK PIGMENTS, used in painting, are derived principally from animal and vegetable substances. They are very numerous, and of different hues and degrees of transparency; but the most important are vegetable blue-black—obtained from beech-wood burned in close vessels—ivory-black, cork-black, and lamp-black, the principal constituent of all being charcoal or carbon. A fine-toned B. pigment is obtained by burning German or French Prussian blue. Combined with white, B. P., which are slow driers, yield grays of several tints.

BLACK, JEREMIAH S., b. Penn., 1810; admitted to the bar in 1830; president of his judicial district in 1842; elected judge of the supreme court of the state in 1851; and was chosen chief-justice. In 1857, president Buchanan made him attorney-general of the United States, and in 1860 secretary of state. He retired from the office when Lincoln's cabinet was appointed, and has since been engaged in his profession and in politics

BLACK, JOHN, an eminent newspaper editor, and classical scholar of some reputation, was a native of Berwickshire, his father being a shepherd, or farm-laborer, in the Lammermoors, near Dunse. Born in 1783, and left an orphan at twelve years of age, B. commenced life in the office of a Dunse writer, but he soon left that place for Edinburgh, where he was engaged for several years as a writer's clerk. While in this capacity, B. was assiduous in the work of self-education; and besides considerable progress made in classical studies at this time, he acquired German from a German musician in an Edinburgh band, and Italian from a refugee. Finding Edinburgh too limited a sphere for his energies, he went to London about the year 1810, and was immediately engaged as a parliamentary reporter for the *Morning Chronicle*, of which paper he afterwards became editor. Under his management the *Morning Chronicle* was celebrated for its independence and fearless advocacy of progress, and that at a time when subserviency was so common that it was regarded as little or no disgrace. He retired from the editorship in 1843, and continued to reside, until his death, which took place June 25, 1855, in a pleasant cottage on the Kentish estate of one of his friends. Among those who acted on the *Morning Chronicle* under Mr. Black was Mr. Charles Dickens, the eminent novelist. B. was author of a *Life of Tasso, with a Historical and Critical Account of his Writings*, 2 vols. (Edin. 1810), and the translator of the lectures of the brothers Schlegel on *Dramatic Art and Literature* (since republished by Bohn), and on the *History of Literature Ancient and Modern*, as well as of one or two works from the French and Italian.

BLACK, JOSEPH, an eminent chemist, was b. in 1728, at Bordeaux, where his father was engaged in the wine-trade. Both his parents were of Scotch descent, but natives of Belfast, to which their son was sent for his education in 1740. In 1746, he entered the university of Glasgow, and studied chemistry under Dr. Cullen. In 1751, he went to Edinburgh to complete his medical course, and in 1754 took his degree. His thesis on the nature of the causticity of lime and the alkalies, which he showed to be owing to the absence of the carbonic acid (called by him fixed air) present in limestone and in what are now called the carbonates of the alkalies, contained his first contribution to chemical science, and excited considerable attention. In 1756, on the removal of Cullen to Edinburgh, B. succeeded him as professor of anatomy (which branch he afterwards exchanged for medicine) and lecturer on chemistry in Glasgow. Between 1759 and 1763, he evolved that theory of "latent heat" on which his scientific fame chiefly rests, and which formed the immediate preliminary to the next great stride in discovery by his pupil and assistant James Watt. In 1766, Cullen was appointed to the chair of theoretical medicine in Edinburgh, and B. succeeded him in the chair of chemistry. Thenceforth he devoted himself chiefly to the elaboration of his lectures, in which he aimed at the utmost degree of perspicuity, and with perfect success. His class became one of the most popular in the university; it occasioned, however, some disappointment that one so capable of enlarging its territory made no further contributions to chemistry. Though of an extremely delicate constitution, he prolonged his life, by care and temperance, to the age of 71. He died on the 26th Nov., 1799. His lectures were published in 1803 (Edin., 2 vols., 4to), edited, with a biographical and critical preface, by prof. Robison.

BLACK ACTS are the acts of the Scottish parliament of the first five Jameses, those of queen Mary's reign, and of James VI., down to 1586 or 1587. They were called the B. A. because they were all printed in the black or Saxon characters. Several of these acts

were afterwards left out in the latter additions, most of them because they were private acts, and a few from reasons of state.

In English law-books, the expression "black act" is applied to the 9 Geo. I. c. 22, because it was occasioned by the outrages committed by persons with their faces blackened or otherwise disguised, and associated, as we are told in the preamble of the act, under the name of Blacks, who appeared in Epping forest, near Waltham in Essex, and destroyed the deer there, and committed other enormities. This act was, however, along with numerous other statutes, repealed in 1827, by the 7 and 8 Geo. IV. c. 27.

BLACK ART. See MAGIC.

BLACK ASSIZE, the popular name commemorative of an extraordinary and fatal pestilence which broke out at Oxford at the close of the assizes, July 6, 1577. The contemporary accounts describe it as having broken out in the court-house, immediately after the passing of sentence on Richard Jencks, a book-binder, condemned for alleged sedition to lose his ears. It was popularly interpreted as a divine judgment on the cruelty of the sentence, but the phenomenon is satisfactorily explained by the pestilential atmosphere of the adjoining jail, then, as it was until long after, a seat of misery, filth, and disease. From the 6th of July to the 12th of Aug., 510 persons are said to have died in Oxford and the neighborhood of this terrible malady, among whom were the chief officials who sat on the assize, most of the jury, and many members of the university. Women, poor people, physicians, visitors, and children are said to have escaped the infection. A similar event is recorded as having taken place at Cambridge at the Lent assizes in 1521 (Holinshed's *Chron.*, Stow's *Annals*, Wood's *Athen. Oxon.*, etc.).

BLACK-BAND IRONSTONE is an ore of iron found very extensively in Scotland and elsewhere. It occurs in the carboniferous system of geologists, in regular bands, layers, or strata, and generally associated with coal and limestone. It is mainly a carbonate of iron accompanied by much coaly matter. The following is the composition of several samples:

	A.	B.	C.	D.	E.	F.
Carbonate of iron*	51.58	50.40	40.62	29.14	53.38	63.80
Carbonate of lime.....	3.76	3.12	1.68	1.52	1.44	1.64
Carbonate of magnesia..	0.11	0.09	0.56	0.04	0.03	0.05
Alumina.....	0.74	0.82	trace	trace	trace	trace
Silica.....	20.96	26.56	8.48	19.84	2.76	4.48
Coaly matter.....	22.64	18.64	49.16	49.46	42.39	30.03
Water and loss.....	0.21	0.37				
	100.00	100.00	100.00	100.00	100.00	100.00
*Metallic iron, per cent..	25.20	25.79	19.61	14.06	25.77	30.80

The B. I. is easily reduced. It does not, however, yield a first-class iron when smelted by itself, and is therefore generally mixed with a small quantity of hematite (red iron ore), which communicates strength and hardness to the iron obtained.

BLACK BEETLE. See BLAPS and COCKROACH.

BLACKBERRY. See BRAMBLE.

BLACKBIRD, or MERLE, *Turdus merula* of some naturalists, *Merula vulgaris* of others, a well-known species of thrush (q.v.), common in all parts of Britain, and throughout Europe generally; found also in the n. of Africa and in the Azores. In Asia, it gives place to a closely allied species, *turdus pœcilopterus*. In size, the B. is intermediate between the missel-thrush and the song-thrush or mavis. The plumage of the adult male is wholly of a deep black color, the bill and orbits of the eyes yellow; the female and the young are of a dark rusty brown, with dusky bill and eyelids. The B. frequents hedges, thickets, and woods; is shy, restless, and vigilant, keeping much under cover of evergreens or shrubs; and when disturbed, takes wing with a vociferous chattering of alarm, seeking refuge in some neighboring thicket. Its food consists of worms, snails, insects, berries, etc. Its fondness for fruit makes it often annoying to the gardener; but probably it would in general be better to protect cherries and pears by nets than to shoot the B., which is of great use as a destroyer of insect larvæ. Like some of the other thrushes, it also devours great numbers of small snails, dexterously breaking the shell against a stone. It is not usually a gregarious bird, although great flocks sometimes appear upon the British coasts in winter, on their passage from more northerly to more southerly countries (*Selby*, quoted by *Yarrell*). Otherwise, the B. is not in Britain a bird of passage. It pairs very early in spring; the male and female are indeed very often seen together during winter; it builds its nest early, and generally has two broods in the year. The nest is generally placed in some thick bush; it is of ruder workmanship than that of the song-thrush, which, however, it resembles, and is usually formed of strong stems of grass, with a finer lining of dry grass inside, and a massive plastering of clay outside. The eggs are four or five in number, of a pale blue color, generally speckled with brown. The voice of the B. is very powerful, and its song more mellow than that of the thrush, but with "much less variety, compass, or execution." The B. is often kept as a cage-bird, and would be much more frequently so, but for the too great loudness of its song: it is very susceptible of being trained,

exhibits considerable powers of imitation, and has even been taught to speak.—The ring ouzel (q.v.), a bird very nearly allied to the B., is sometimes called the ring B.—The crow blackbirds (q.v.) of America are entirely different.—The SAVANNA B. of the West Indies is also of a different family. See CROTOPHAGA.

BLACKBIRD (*ante*), *Agelaius phœniceus*, in New England called the "redwing;" of glossy black plumage, except the small wing-covers, in which the first row of feathers is cream-colored and the remainder deep scarlet; about 9 in. long with a spread of wing 14 inches. The female is smaller, with the red and black less distinct. The B. visits all parts of America, arriving in New England usually about the 1st of April. It prefers swamps and low meadows, living upon insects, worms, and young corn; resting in the grass or low bushes, and depositing from three to half a dozen eggs, white with a shade of blue and faint lines of purple. These birds do much damage to corn in the fall, for which reason they are remorsely hunted. In some of the United States and Canada the name B. is given to the rusty grakle, *scolecophagus ferrugineus*, and in other places to the purple grakle, *quiscalus versicolor;* but these belong to the starling family.

BLACKBIRD, a co. in n.e. Nebraska, on the Missouri river; pop. '70, only 31. The whole co. is occupied by the Omaha (Indian) reservation.

BLACKBURN, a manufacturing t. in the middle of Lancashire, on the Blackburn stream now called simply "the brook," 21 m. n.n.w. from Manchester. It is much improved of late years, and has a very beautiful Gothic parish church. Coal and lime abound in the vicinity. The great business of the town is the manufacture of cotton stuffs. There are also woolen factories, and large establishments for the manufacture of weaving machinery. Above 200 years ago a kind of linsey-woolsey was well known as the "Blackburn checks," afterwards superseded by the "Blackburn grays," so called from their being printed unbleached. Here James Hargreaves (q.v.), a native of the town, invented the spinning-jenny in 1767. He was driven out of the country, and it was more than 40 years before B. followed in the general track of improvement introduced by his invention. Pop. in '71, 82,926. B. returns two members to parliament. B. has a grammar-school founded by queen Elizabeth in 1567, as well as a number of other educational establishments and religious and benevolent institutions. There is a public park of 50 acres open to the public. The finest building in the town is the exchange.

[The following is from *Chambers's Supplement.*]

BLACKBURN, an inland t. of Lancashire, England, 21 m. n.n.w. from Manchester, and 12¼ m. by railway e. by s. from Preston. It stands on a stream from which it appears to derive its name, a branch of the Ribble. The surrounding district, formerly known as *Blackburnshire*, or *Blaqbornshire*, was long very wild and dreary, but is now very populous. Coal and lime abound in it. B. had acquired some importance as a market-town in the 16th century. Its manufacturing prosperity can be traced back at least to the middle of the 17th c., when it was noted for the production of a kind of linsey-woolsey known by the name of *Blackburn checks*, afterwards superseded by the *Blackburn grays*, so-called from their being printed unbleached. In the course of the 18th c., the cotton manufacture became the chief industry of the town, which is now one of the chief seats of it, the number of cotton factories being very large, and many of them employing from 1000 to 2000 operatives. The value of the calicos and other cotton goods annually produced was estimated some years ago at nearly £2,000,000 sterling, and is now certainly much more. The steam-power employed in the works for spinning and weaving cotton has been more than doubled within the last 20 years. Many improvements in machinery for the cotton manufacture have been made in B., among which the first place in importance as well as in date must be assigned to the invention of the spinning-jenny, by James Hargreaves (q.v.), a native of the town, in 1767. His invention, however, was regarded with so much popular dislike that he was compelled to remove from the town, and it was not till the beginning of the present c. that it came into general use in the cotton-works of Blackburn. The pop of B. in '51 was 46,536; in '61, 63,126. In '71, pop. of municipal borough was 76,339; of parl. b., 82,928. A range of hills on the n. of the town shelters it from the coldest winds. Many of the streets are spacious, and the town is generally well built. A park of 50 acres, known as the *corporation park*, has recently been laid out for public recreation. The most elevated part of this park is about 700 ft. above the level of the sea, and commands a very extensive view. The parish church, St. Mary's, is a very beautiful Gothic building, erected between 30 and 40 years ago. There are numerous other places of worship, both of the established church and of various denominations of dissenters. The grammar-school was founded by queen Elizabeth in 1567; and there are many other educational establishments, and many benevolent and religious institutions. The finest building in the town is the exchange, built in 1865, in the Gothic style, and containing a magnificent room, 40 yards by 20. The town-hall is also worthy of being mentioned. B. is supplied with water from capacious reservoirs, which have been constructed in the neighborhood. The Leeds and Liverpool canal, passing on the s. side of the town, affords important facilities for the conveyance of goods; and B. is connected by several railways with all the neighboring towns, and so with all parts of the kingdom. B. is governed by a mayor, 12 aldermen, and 36 common

councilmen. It sends two members to parliament, a privilege which it obtained under the reform bill of 1832.

BLACKCAP, Blackcap Warbler, or Blackcap Fauvette (*curruca atricapilla*), a bird of the great family of the *sylviadæ*, or warblers, and of the same genus to which the nightingale is commonly referred. See Fauvette, Warbler, and Sylviadæ. It is regarded as the sweetest song-bird in Britain, or indeed in Europe, except the nightingale, to which it is said to be even superior in "its shake or trilling note." Very often, however, the strain is desultory, and of short continuance; but it is loud, rich in tone, and has a "great variety of sweet and gentle modulations." White says, in his *Natural History of Selborne*, that while the B. warbles, its throat is wonderfully distended. It is a rather smaller bird than the nightingale; the female is larger than the male. The back, wings, and tail are of an ash-brown color; the chin, throat, and breast are gray; the belly, white. The upper part of the head in the male is jet-black; in the female of a dull rust color. The feathers of the head, both in the male and female, are somewhat erected, giving the bird a hooded appearance, on account of which it is called in Germany *the monk*. In Britain, the B. is a bird of passage, arriving early in spring, and retiring in Sept. The males, as in the case of the nightingale, arrive a few days before the females. The B. is not a common bird in Britain: it is most frequent in the southern counties of England, but is found even in Scotland; on the continent, it extends its migrations as far n. as Lapland. In the s. of Europe, it is found both in summer and winter. As a cage-bird, it is pleasing not only on account of its song—which, however, is sometimes partly spoiled by its too successful imitation of other birds—but also on account of its manners, the intelligence which it displays, and its strong attachment to those who are accustomed to feed and caress it.

BLACKCAP TITMOUSE, or Chickadee', a North American bird. See Titmouse. The marsh titmouse, a British bird, is sometimes called blackcap, or blackcap Titmouse.

BLACK CHALK is a variety of clay-slate (q.v.), containing a considerable proportion of carbon. It is used for drawing, and is also ground down to form a black paint. It is found as a rock of a slaty texture and bluish-black color in the island of Islay and in Caernarvonshire, also in Spain, and other parts of the world.

BLACKCOCK, Heath-Fowl, or Black Grouse, *Tetrao tetrix*, a species of grouse (q.v.), abundant in Britain wherever there are moors of considerable extent, and more particularly where there are bogs and morasses with rank herbage, or, adjacent to the moors, natural woods or young plantations of pine and fir. Comparatively rare in the s. of England, the B. becomes more common towards the n., and is very plentiful in the mountainous parts of Scotland. It is found in some of the Hebrides, but not in the Orkney or Shetland isles. On the continent of Europe, it occurs both in mountainous and marshy countries, as on the Alps and in Holland; it is found as far s. as the Apennines, and as far n. as the forests of Lapland; it abounds in most parts of Scandinavia, where it is carefully protected, the males only being killed, great numbers of which are sent to the London market; it is diffused over almost all parts of Russia, and is found in Siberia. The male is much larger than the female, sometimes weighing as much as 4 lbs., whilst the female weighs only about 2 lbs.; they also differ very much in plumage. The male is of a shining bluish-black color, with a conspicuous white bar on the wings below the ends of the great wing-coverts, and a mixture of black and white on the legs; there is a piece of bare scarlet skin over the eye; the outer feathers on each side of the tail are elongated and curve outwards, giving it a very peculiar appearance. The female, called the *gray hen*, is of a rust color, darkest on the upper parts, everywhere barred and mottled with a darker color; the tail is straight and even at the end. The young males resemble the females in plumage. The shank in this species is feathered, but not the toes. It is a gregarious bird, the different sexes, however, in winter, generally keeping in flocks by themselves. In spring, the males resort to elevated and open spots, where they crow, and also make a sound which has been likened to the whetting of a scythe, thus inviting the females to repair to them; they strut and trail their wings like turkey-cocks, and fierce contests often take place among them. They are polygamous, and pay no attention to the female during incubation, nor do they take any part in rearing the young.—The nest is of the simplest construction, a few straws or the like, placed together among tall heath, or under the shelter of a low thick bush. The eggs, six to eight in number, are yellowish-white, speckled with orange-brown, and about 2 in. long. The food of the B. consists of the seeds of rushes and other plants, berries, insects, the tender shoots of heath, leaves, etc.; it sometimes visits cornfields and stubbles to feed on corn; is frequently to be found in turnip-fields in the neighborhood of plantations in hilly districts; and, at least in winter, eats the young shoots of pines, firs, birches, and alders. It is highly esteemed for the table.

It seems to be well established that hybrids are occasionally produced between the B. and other species of grouse; and also between the B. and the pheasant; but this subject, although regarded with much interest by some of the greatest naturalists, has not yet received the investigation which it deserves, and nothing appears to be known concerning any offspring of such hybrids. See Yarrell's *British Birds*, ii. 289–314. It can only be deemed probable, not certain, that the bird called *tetrao hybridus*, sometimes

found in the Scandinavian peninsula and other parts of Europe, is a hybrid between the B. and the capercailzie (q.v.).

BLACK DEATH was one of the names given to an oriental plague marked by inflammatory boils and tumors, which in the 14th c. desolated the world. It took this name from the black spots, symptomatic of a putrid decomposition, which, at one of its stages, appeared upon the skin.

Our information as to the symptoms and course of this terrible malady is far from perfect. So much is clear, that they varied somewhat from case to case, and in different countries, and greatly changed towards the close of the period of its ravages in Europe (1348–51). Among them may be noticed great imposthumes on the thighs and arms—what are called buboes—and smaller boils on the arms and face; in many cases, black spots all over the body; and in some, affection of the head, stupor, and palsy of the tongue, which became black as if suffused with blood; burning and unslakable thirst; putrid inflammation of the lungs, attended by acute pains in the chest, the expectoration of blood, and a fetid pestiferous breath. On the first appearance of the plague in Europe, fever, the evacuation of blood, and carbuncular affection of the lungs brought death before the other symptoms could be developed; afterwards, boils and buboes characterized its fatal course in Europe as in the east. In almost all cases its victims perished in two or three days after being attacked. Its spots and tumors were the seals of a doom which medicine had no power to avert, and which in despair many anticipated by self-slaughter.

If the symptoms of the B. D. have been only imperfectly handed down to us, the history of its rise and progress is still more obscure. But while fable enters largely into its history, it would seem to be safe to assign its birthplace to China; and there is a strong concurrence of testimony, that the causes which co-operate to produced it are to be sought for as far back as 1333—15 years before its outbreak in Europe—in a series of great convulsions of the earth's structure, which commenced in that year, and which, for 26 years thereafter, continued powerfully to affect the conditions of animal and vegetable life. The precise date of the appearance of the plague in China is unknown, but from 1333 till 1348, that great country suffered a terrible mortality from droughts, famines, floods, earthquakes which swallowed mountains, and swarms of innumerable locusts; and in the last few years of that period, from the plague. During the same time Europe manifested sympathy with the changes which affected the east. The order of the seasons seemed at various times to be inverted; storms of thunder and lightning were frequent in the dead of winter, and there occurred great earthquakes and eruptions of volcanoes conceived to have become extinct. The theory is, that this great tellurian activity, accompanied by the decomposition of vast organic masses, myriads of bodies of men, brutes, and locusts, produced some change in the atmosphere unfavorable to life; and some writers, speaking of the established progress of the plague from east to west, say that the impure air was actually visible, as it approached with its burden of death. "A dense and awful fog was seen in the heavens, rising in the east, and descending upon Italy" (*Mansfeld Chronicle in Cyriac Spangenberg*, chap. 287, fol. 336). With this view of the plague is to be conjoined another regarding the causes which produced a predisposition of the inhabitants of Europe to become its victims, and which are referred to the effects on the popular health partly of scarcity and partly of the prevalent bad habits of living. There is much probability in the theory, that the plague was owing to an atmospheric poison acting on the organs of respiration, which, it will be recollected, were always those first attacked. But while impurity of the air and the state of the public health may have largely contributed to the mortality, it may be doubted whether the disease did not owe its extension almost wholly to infection and contagion, whatever causes may have originally produced it. It appears that the pestilence had in a milder form appeared in Europe in 1342, but it had passed away, and there is little reason for holding that, in the interval, it remained merely latent. The invasion of 1548 may actually be tracked from China in its advance by the various caravan routes towards the west. The northern coast of the Black sea sent the plague by contagion to Constantinople. By contagion it reached the seaports of Italy, and thence, as from so many foci of contagion, it soon established itself over Europe. Its advance may be traced through Germany and France to England, from which it was transmitted to Sweden. It was three years from its appearance at Constantinople, before it crept, by a great circle, to the Russian territories. This fact of its spread by contagion has led to speculations as to whether, by rigid rules of quarantine, it might not have been excluded from Europe. Such rules are now at many points in force as securities against oriental plagues.

There are no proper materials for estimating the mortality which this plague produced, for it occurred before the value of statistics was appreciated. But in China, 13,000,000 are said to have died, and in the rest of the east nearly 24,000,000. These numbers appal the imagination. Coming to Europe, the horror is increased by the greater exactness of the details. London alone lost over 100,000 souls; 15 European cities lost among them about 300,000; Germany is calculated to have lost 1,244,434; Italy, one half of its population. On a moderate calculation, it may be assumed that there perished in Europe 25,000,000 human beings. Africa suffered with the rest of the known world. Everywhere was death. All animal life was threatened. Rivers were consecrated to

receive corpses, for which none dared perform the rites of burial, and which in other places were cast in thousands into huge pits made for their reception. Death was on the sea, too, as well as on the land, and the imagination is quickened to the realization of the terrible mortality by accounts of ships without crews—the crews dead and putrefying on the decks of the aimless hulls—drifting through the Mediterranean, the Black and the North seas, and cursing with the contagion the shores on which winds or the tide chanced to cast them.

The mortality caused by the plague was, however, only one of the evils to which it gave rise. Its moral effects on the survivors and the frame of society were no less momentous. Many died of fear, which among the living dissolved the ties of kindred; mothers forsook their plague-stricken children; the worldly became quickened to a maddening sense of sin; the religious fixed their eyes more steadily on futurity; all rushed to sacrifice their means to the church, while the ecclesiastics drew back from the gold showered over their walls, as being tainted with death. Superstition finally banded multitudes together by common means to work out the common safety. In Hungary, and afterwards in Germany, rose the brotherhood of the Flagellants, who undertook to expiate the sins of the people, and avert the pestilence by self-imposed sufferings. Originally of the lower classes, they gathered to their order, as it extended, crowds of the highest, both men and women, and marched from city to city, robed in somber garments, with red crosses on the breast, back, and cap, and with their heads covered as far as the eyes; they went chanting in solemn processions with banners, with down-turned faces, and bearing triple scourges with points of iron, with which, at stated times, they lacerated their bodies. They at last pervaded nearly all Europe; Germany, Hungary, Poland, Bohemia, Silesia, and Flanders did them homage. This, however, is not the place to give their history, for which the reader will refer to the article under the head FLAGELLANTS. Suffice it that the order was not suppressed till the pope, at the instigation of several crowned heads, prohibited throughout Christendom their pilgrimages, on pain of excommunication. While the wanderings of the Flagellants threw society into confusion, and helped to spread the plague, the horrors of the time were further heightened by the fearful persecutions to which the Jews were subjected, from a popular belief that the pestilence was owing to their poisoning the public wells. The people rose to exterminate the Hebrew race, of whom, in Mayence alone, 12,000 were cruelly murdered. They were killed by fire and by torture wherever they could be found, and for them, to the terrors of the plague were added those of a populace everywhere infuriated against them. In some places, the Jewish people immolated themselves in masses; in others, not a soul of them survived the assaults of their enemies. No adequate notion can be conveyed of these horrors. To aggravate the pestilence, the poison-panic made the people shut up their wells. With terror of poison and of plague in a state of society rude at the best, but now disorganized, what means were available to mitigate or prevent the sufferings of the people were rendered altogether nugatory.

It would be useless to attempt to give any notion of the effects on society of this plague; how during it some, like people in sieges, came to be callous, and some, like thieves under the gallows, to regard the desolation only as it afforded opportunities for plunder and indulgence. The whole phenomena would form a fine study for the social philosopher and psychologist. We must content ourselves here with referring the reader to the *Decameron* of Boccaccio for a description of the plague at Florence, which, for vividness and particularity of observation, almost equals Thucydides' account of the plague at Athens. In Bulwer's *Rienzi*, also, an account of the plague will be found. The reader should also consult Hecker's *Epidemics of the Middle Ages*, translated for the Sydenham society. Accounts of the plague have been left us by the physicians Guy de Chauliac and Chalin de Vinario. But perhaps Boccaccio's is the best of the whole. The B. D. afterwards more than once appeared in Europe, but never with the same virulence or duration.

BLACK DEATH, THE RECENT, is the title commonly given to a very fatal disease which occurred in Ireland, in an epidemic form, in the years 1866–67. It is described under the title of EPIDEMIC CEREBRAL MENINGITIS.

BLACK DUCK, *Anas obscura*, one of the most valuable of game birds, generally abundant over all the United States, and believed to be capable of domestication. Its color is brown-black, with bright tints about the neck and bill.

BLACKFEET, or SATSIKA, a tribe of Algonquin Indians originally residing on and near the Saskatchewan, but migrating to Missouri. There are at present three divisions of them scattered over the borders of British America and the United States from Hudson's bay to the Yellowstone region. The B. are warlike, and sun-worshipers; they do not bury their dead, but, in case of a warrior, leave him in his tent in full dress, and sacrifice horses at his door for his use in the happy hunting-grounds. It is supposed that there are about 7000 in the United States and 6000 in Canada.

BLACKFISH, *Centro'lophus moris*, a fish of the family of the *scombe'rida* (q.v.), very nearly allied to the beautiful coryphens (q.v.) so frequently called dolphins. It is found both in the Mediterranean sea and on the western coasts of Europe, occasionally on the southern coasts of Britain, but is everywhere rare, perhaps because it is an inhabitant chiefly of deep waters. It is known to attain a length of more than 30 in., and a weight

of 14 lbs. The general form is not unlike that of a perch; there is a single elongated dorsal fin with short rays, rising from a thin elevated ridge; the body is covered with minute scales, the skin is tough and can be stripped off like that of an eel; there is no air-bladder. The color is black; that of the fins intensely so. The B. is remarkable for great strength and velocity. As an article of food, it is described as delicious.

BLACK FLUX is prepared by heating in a covered crucible ordinary or crude cream of tartar, or the bitartrate of potash ($KO,HO,C_8H_4O_{10}$), when the tartaric acid ($C_8H_4O_{10}$) is decomposed and charred, forming carbonic acid (CO_2), which remains in combination with the potash (KO) as carbonate of potash (KO,CO_2), accompanied by much free carbon. This very intimate mixture of carbonate of potash and carbon, otherwise called B. F., is a fine black powder of great service in the fluxing of metallic ores, as of lead (q.v.), and the separation of the metal therefrom. The B. F. is likewise employed as the raw material from which, on the application of heat in iron vessels, the metal potassium can be obtained.

BLACK FLY, a dipterous insect, the especial torment of man and beast in the arctic and northern temperate latitudes. In the eastern British provinces and Labrador they are more abundant than mosquitoes in the tropics, crawling under the closest garments and into beds, and defying all means of protection. They are very small, mere midges, hardly visible, black, with one white band. In wet weather they are dormant, but in clear sunny days they almost cloud the sun, and can be only partially dispersed by the Indian remedy of a dense smoke. Tar ointment on the exposed skin is said to be the best defense. Their bite is like a sting, but seldom creates swelling, and is not dangerous. Seth Green says that the larva of this fly spins a web under water as perfect as that of a spider. The buffalo gnat of the west is a larger species of this fly, and is said to have destroyed even horses by its bite.

BLACKFORD, a co. in e. central Indiana, on the Salamonie river, traversed by the Fort Wayne, Muncie and Cincinnati railroad; 180 sq.m.; pop. '70, 6272; level and rolling surface and fertile soil; products agricultural. Co. seat, Hartford city.

BLACK FOREST (Ger. Schwarzwald), a wooded mountain-chain in Baden and Würtemberg, running from s. to n. along the western side of Swabia, parallel with the course of the Rhine after its great bend near Basel, and often only a few miles distant from it. The Rhine also bounds it on the s., and the level country between the Enz and the confluence of the Neckar with the Rhine borders it on the n.; lat. 47° 30′ to 49° 30′ n., long. 7° 40′ to 9° east. The chief rivers rising in the B. F. are the Danube, Neckar, Murg, Kinzig, Elz, Enz, and Wiessen. The B. F. attains its greatest elevation in the bare and round-topped Feldberg (about 4850 ft. high), which rises near the source of the Wiessen and the celebrated Hölle (Hell) pass, a narrow valley shut in by mountains in the vicinity of Neustadt. The great mass called the Kaiserstuhl (emperor's chair), situated near Breisach, is quite isolated. As to the geological character of the B. F., primitive granite and gneiss form its core, porphyry is found on its sides, and sandstone along its highest ridges, as well as at its base. Silver, copper, cobalt, lead, and iron are found in greater or less quantity in its principal chain, which is luxuriantly wooded, its name Schwarzwald being derived from the dark-tinted foliage and immense number of its fir-trees. The B. F. is also rich in mineral waters, as, e.g., the baths of Baden-Baden and Wildbad (q.v.). On the Rhine side, the descent is precipitous, but towards the Danube and the Neckar it is gradual. Among its numerous valleys, the Murgthal is the most famous for its natural beauties. The western slopes are studded with vineyards. Summer rye, oats, and potatoes are cultivated in some parts of the B. F.; but it is with difficulty, and the rearing of cattle is prosecuted with much greater success. This, and the manufacture of articles of wood, forms the chief industry of the inhabitants. The making of wooden clocks and other kinds of timepieces employs about 40,000 persons; and not less than 600,000 articles of this kind, including music boxes, are exported annually to all parts of the world, 1000 dealers being engaged in the traffic.

Two of the passes of the B. F., the Kniebis and the Hölle, acquired considerable celebrity during the wars of the French revolution. The first, situated on the borders between Baden and Würtemberg, at the source of the Murg, was taken by the French in 1796 and in 1797; the Hölle is known in connection with Moreau's retreat in 1796.

BLACKFRIARS. See DOMINICANS, *ante*.

BLACK FRIDAY, in England, 6th Dec., 1745, the day on which news reached London that the Pretender had arrived at Derby. Again, May 11, 1866, when the failure of Overend, Gurney, etc. (on the previous day) brought on a most disastrous financial panic. In America, Sept 25, 1869, when the wild speculation in gold, in New York and other cities, culminated in a crash that swept thousands of firms and individuals into financial ruin.

BLACK GUARDS, originally applied to the scullions and lower servants of the English court who were clothed in black garments. Gibbon says, "those who carried coals to the kitchen, rode with the pots and pans, and were in derision called the black guards." The title is recognized in an official proclamation of 1683, which says:

"whereas, a sort of vicious, idle, and masterless boyes and rogues, commonly called the black guard, with divers other lewd and loose fellows," etc.

BLACK GUM, the popular name of the *Nyssa multiflora*, the "hornpipe" of New England, and "pepperidge" of the middle states. It grows in thick forests, has crooked branches, and is densely covered with bright green leaves in turfs of four or more at the ends of the branches; bears flowers of greenish hue, becoming blue-black as they ripen; wood close-grained and very tough, but not durable. The timber is used for hubs of wheels and in other places where splitting is to be avoided. It is an ornamental tree in England.

BLACK HAWK, a co. in n.e. Iowa, on Cedar river; reached by the Iowa division of the Illinois Central, and the Burlington, Cedar Rapids, and Northern railroads; 576 sq.m.; pop. '75, 22,913; in '80, 23,913; prairie surface with some forests, producing wheat, corn, oats, butter, etc. Co. seat, Waterloo.

BLACK HAWK, b. about 1768, in a village of Sac Indians on the Mississippi, near Rock river; d. Oct. 3, 1838. In the war of 1812, Black Hawk, then a leading Sac and Fox chief, took the English side. After the war he resisted the encroachments of white settlers, and provoked several petty conflicts, but was subdued and captured in 1832. The tribe was removed, but Black Hawk and his sons and a few warriors were kept a while as hostages, and brought as a show to the eastern cities.

BLACKHEATH, a high-lying open common, in the county of Kent, 5 m. s.e. of London, near Greenwich Park. It commands a fine view of great extent, and being a healthy tract, many villas have been built on its margin. It is a favorite holiday resort for Londoners. The Roman road to Dover crossed it. B. is one of the few places in England where the ancient Scottish game of golf is practiced. On it stands Morden college, founded in 1695 by sir J. Morden for decayed merchants, and with a revenue of £5000. B. was formerly the scene of several insurrections, including those of Wat Tyler, 1381, and Jack Cade, 1450. Here the Danes encamped in 1011; the Londoners welcomed Henry V. from Agincourt; and Charles II., on his way from Dover, met the army of the restoration. B. was also a noted place for highwaymen.

BLACK HILLS, a mountain region in s.w. Dakota and n.e. Wyoming, about 100 by 60 m., rich in mines. In 1876–77 there was trouble with the Indians, whose reservations covering much of the country were invaded by whites in search of gold and silver. Within a few months a number of settlements grew up like Jonah's gourd, and the names of the new towns, Deadwood, Gayville, Central city, Lead city, and others appeared in the newspapers. The mining business continued prosperous, and the product of gold up to the close of 1878 was nearly $2,300,000. The hills are from 2500 to 3000 ft. above sea-level at their base, and the highest peak is 6700 feet. They are a continuation of the Big Horn spur of the Rocky mountains. (See DAKOTA.)

BLACK HOLE, an appellation familiarly given to a dungeon or dark cell in a prison, and which is associated in the public mind with a horrible catastrophe in the history of British India—namely, the cruel confinement of a party of English in an apartment called the "Black Hole of Calcutta," on the night of the 18th of June, 1756. The garrison of the fort connected with the English factory at Calcutta having been captured by the nabob Suraja Dowlah, this barbarian caused the whole of the prisoners taken, 146 in number, to be confined in an apartment 20 ft. square. This cell had only two small windows, and these were obstructed by a veranda. The crush of the unhappy sufferers was dreadful; and after a night of excruciating agony from pressure, heat, thirst, and want of air, there were in the morning only 23 survivors, the ghastliest forms ever seen on earth. See HINDUSTAN.

BLACKIE, JOHN STUART, professor of Greek in the university of Edinburgh, was b. in Glasgow in 1809, but received his early education in Aberdeen, where his father was agent for a bank. After going through the usual course of a Scotch university education —partly at Marischal college, Aberdeen, partly at Edinburgh—with a view to the church, he went in 1829 to Germany, and studied for some time both at Göttingen and Berlin. He thus acquired a mastery of German, and an acquaintance more extensive than ordinary with the literature of that language. On his return, having abandoned the thought of entering the church, he began the study of law, and passed as advocate at the Edinburgh bar in 1834. But he soon found the practice of the profession uncongenial, and devoted himself henceforth to literary pursuits. Among his earliest productions was his translation, in English verse, of Goethe's *Faust*, which was preferred by G. H. Lewes to any other of the metrical translations. He wrote also about this period numerous articles in the *Foreign Quarterly Review*, the *Westminster*, *Blackwood*, and *Tait*, chiefly on German subjects. In 1841, he was appointed by the crown to the chair of humanity in Marischal college, which he held until, in 1852, he was elected to the Greek chair in the university of Edinburgh. Ever since he became professor, he has been incessant in advocating educational reform in Scotland. He took an active part in the movement that led in 1859 to the remodeling of the Scottish universities. During 1874–76, B. advocated throughout the country, with great enthusiasm, the foundation of a Celtic chair in Edinburgh university, and was successful in raising upwards of £10,000 of endowment. Of works of a professional and philological kind may be men-

tioned two lectures *On the Studying and Teaching of Languages; On the Rhythmical Declamation of the Ancients; The Pronunciation of Greek; Accent and Quantity*, 1852. Among the most matured and scholarly of B.'s productions is his metrical translation, with notes, of the dramas of Æschylus, published in 1850. In 1853, he spent above three months in Athens, acquiring a complete mastery of the language as now spoken; and as fruits of the visit, there appeared articles on the subject in the *North British* and *Westminster Reviews*. In 1866, prof. B. gave to the world *The Iliad of Homer, translated into English Verse, with Commentary and Introductory Dissertations* (Edin.), in which he endeavors to present Homer to the English reader in his distinctive character as a popular singer. Of late years B. devoted himself with enthusiasm and success to raising funds for the endowment of a Celtic chair in the university of Edinburgh. In 1878 he spent some months in Egypt.

Not content with educational and philological subjects, the versatile activity of prof. B. has led him to make incursions into the fields both of abstract speculation and of poetry. He published in 1858 a treatise on *beauty*, in refutation of lord Jeffrey's association theory. Others of his works are *Lays and Legends of Ancient Greece, with other Poems* (1857); *Lyrical Poems* (1860); *Musa Burschicosa* (1869); *War Songs of the Germans* a translation, 1870; *Four Phases of Morals* (1871); *Songs of the Highlands and Islands* 1872); *Self Culture* (1873); *Horæ Hellenicæ* (1874); *Songs of Religion and Life* (1876).

BLACKING is the material employed for producing a black glazed shining surface on leather. The main ingredient in the various kind of B. is bone-black (q.v.), which is mixed with an oil, some sugar, and a little sulphuric acid. The materials in Day and Martin's B. are finely powdered bone-black ground with sperm-oil, raw sugar or molasses, a little vinegar, and some concentrated sulphuric acid (specific gravity 1850). The substances are incorporated together one by one in the order in which they are stated, and the action of the sulphuric acid is to convert much of the lime in the bone-black into sulphate of lime, which causes a thickening of the mixture, and a tenacious paste results. This paste, diluted with weak vinegar, is put, while warm, in stone-ware bottles, and is then ready for the market.

BLACK JACK, the name given by miners to blende (q.v.). It was also the name applied in former times to a kind of drinking flagon.—B. J. (tree), see OAK.—B. J. or NIGGER CATERPILLAR, see TURNIP SAWFLY.

BLACK LEAD, GRAPHITE, or PLUMBAGO, a mineral consisting chiefly of carbon, but containing also more or less of alumina, silica, lime, iron, etc., to the extent of 1 to 47 per cent, apparently mixed rather than chemically combined. B. L. is the popular name, and that by which it is generally known in the arts; graphite is that generally preferred by mineralogists.—The name B. L., however, ought, perhaps, to be regarded as an unfortunate one, as no lead enters into the composition of the mineral. It sometimes occurs crystallized in short imbedded hexagonal prisms; but generally massive, and more or less radiated, foliated, scaly, or compact. It is of a grayish-black color, with a somewhat metallic luster, and is perfectly opaque. It is greasy to the touch, and is a perfect conductor of electricity. It is found in primary and transition rocks, as in gneiss, mica-slate, quartz-rock, greenstone, and clay-slate, and pretty abundantly in various parts of the world. It is much more combustible than even anthracite (or *blind-coal*), burning with much difficulty even before the blow-pipe, on which account it is much used for the manufacture of crucibles or "melting-pots," which withstand a great heat. These are not, however, made of mere B. L., but of B. L. in powder, mixed with half its weight of clay. B. L. is employed for making pencils (q.v.). It is also extensively employed to give a black gloss to iron grates, stoves, railings, etc., and to diminish the friction of the belts and other parts of machinery. Lately it has been suggested as a lubricating agent in the cartridges of rifles, instead of lard or tallow.—Much B. L. is obtained at Borrowdale, in Cumberland; there are also great deposits in Siberia, and in Missouri, U. S.

BLACK LETTER (**Black Letter**), the name commonly given in this country to the types which on the continent are most generally known as Gothic. The first printed books imitated every peculiarity of the contemporary manuscripts; and as printing was first practiced in Germany and the Netherlands, the first types were copies of the letters in use in those countries in the middle of the 15th century. Two sorts of letters have been employed in the writings of western Christendom. What have been called Roman letters prevailed from the 5th to about the close of the 12th c., when they gradually began to pass into what have been called Gothic letters, which continued till the 16th c., when, in most European countries, they were superseded by Roman letters. The first types, as has been said, were Gothic, and they spread with the art of printing into various European states. In France and Italy, they were slightly modified by cutting off some of their rougher points; and when thus trimmed, they came to be known in the former country as *lettres de somme*, being so called, it is said, from their use in an edition of the *Summa* of St. Thomas Aquinas. The classic taste of Italy could not long tolerate the Gothic character even of the *lettres de somme;* and they were still further modified, until they assumed the shape to which the name of Roman letters has since been given. The first works printed with these new types were two beautiful editions of Pliny's *Natural History:* the one by John of Spira at Venice in 1469, and the other by his disciple,

Nicholas Jenson, also at Venice, in 1472. Another Venetian printer—the first Aldus Manutius—attempted in 1501 to supersede the Roman letters by what have been called Aldine (q.v.) or Venetian, but are best known as Italic characters. These can scarcely be said to have come into much more than temporary or exceptional use; but the Roman letters in no long time spread from Venice all over the west of Europe. Although thus supplanted in general use, the Gothic or B. L. was long retained for special purposes, such as, in this country, the printing of bibles, prayer-books, proclamations, and acts of parliament. Books in B. L. being the earliest, are highly prized by antiquaries and bibliomaniacs, who are hence sometimes spoken of as "black-letter" devotees. Thus, Matthias, in his *Pursuits of Literature* (published in 1796), alluding to the commentators on Shakespeare, writes:

> On Avon's banks I heard Actæon mourn,
> By fell *black-letter dogs* in pieces torn;
> Dogs that from Gothic kennels eager start, etc.

A form of the B. L. still continues in general use in Germany, but of late has begun to give way in some quarters to the Roman.

BLACK LIST. Such is the name familiarly applied to printed lists connected with insolvency, bankruptcy, and other matters affecting the credit of firms and individuals, and which are circulated for the private guidance of the mercantile community. These lists, which serve an important purpose, are well known by commercial men in the United Kingdom. For the most part they are published in London weekly; but some are biweekly. In their contents are embraced the English bankruptcies and liquidations by arrangement under the act of 1870; the bankruptcies of Scotland and Ireland; Scottish registers of protested bills; decrees in absence; judgments for debt in the Irish courts; offers of composition; dissolutions of partnership; warrants of attorney and cognovits; judges' orders; bills of sale, etc. The legality of issuing information of this kind has been challenged, but it has been determined that it is quite lawful. In point of fact, the lists are only extracts from public registers, as are the ordinary lists of bankruptcies in the newspapers. Private lists of a more searching kind are furnished to subscribers by Mr. Thomas Perry of Cornhill, the proprietor of the "original bankrupt and insolvent registry office, for protection against fraud, swindlers," etc.; and also by the Scottish trade protection society, Edinburgh. See TRADE PROTECTION SOCIETIES. In the United States, printed lists of forgeries of bank-notes are similarly issued. In one of these *counterfeit detectors*—which is certainly *black* enough—may be counted some thousands of varieties of forged bank-notes in circulation; the whole revealing a frightful state of commercial and moral depravity.

BLACKLOCK, THOMAS, D.D., a remarkable example of the power of the mind to overcome the most oppressive disadvantages, was b. at Annan in 1721, and d. at Edinburgh in 1791. The child of humble parents, and deprived before he was six months old of the power of sight, he won for himself before he reached middle age the designation of an accomplished scholar, a cultivated thinker, and, for those times, a respectable poet. After going through the necessary course of academic study in Edinburgh, he was licensed as a preacher of the established church in 1759, and in 1762 was ordained minister of Kirkcudbright. The determined resistance of the congregation to the appointment, based apparently on his too philosophical and "moderate" style of preaching (joined perhaps to the fact that he was the intimate friend of David Hume), led to a litigation, to his sensitive mind extremely distressing, and he resigned the charge in consideration of a small annuity. After this, he resided in Edinburgh till his death, occupied chiefly in superintending the education of a limited number of boarders, a charge for which his varied accomplishments and benign manners peculiarly qualified him. He will, however, be best remembered in connection with that famous letter of his which happily arrested Robert Burns on the eve of his departure for the West Indies, and thus, to all human appearance, saved from oblivion the greatest lyrist that the world has seen. A collected edition of his poems was published in 1793, with a biographical sketch by Henry Mackenzie.

BLACK-MAIL, a scarcely voluntary impost submitted to, in the earlier half of the 18th c., by the people of the Highlands, and parts of the Lowlands bordering on the Highlands, as a kind of compromise with robbers. The districts in question, being then in an extremely barbarous state, enjoyed but an imperfect protection from the law. Owing, moreover, in part, to political and social circumstances, theft and robbery were not then regarded in the Highlands as they are now: to carry off the cattle of a neighbor was perhaps only wreaking out an old family quarrel or clan dispute, or making reprisals for some severity of persons in power. Certain it is that men of good standing gave a certain degree of protection to notorious cattle-lifters. In these circumstances, a class of men rose up who professed to take upon themselves the duty of protecting the property of individuals, on the payment by them of a percentage on their rents, generally 4 per cent. They were not low men who did so; nearly all of them had good Highland pedigrees, and passed externally as honorable persons, though there was only too great reason to suspect that they encouraged and profited by robberies, in order to make the black-mail a necessity. The celebrated Rob Roy was, about 1730, a notable levier of black-mail in the southern Highlands and adjacent Lowland districts. A little later, Coll

M'Donell of Barrisdale, a cadet of the Glengarry family, was equally noted further north. When one of the payers of the black-mail suffered what was called a *hership*, the levier of the impost, being quickly informed of what had happened, busied himself to recover the lost cattle, and if he failed, he held himself bound to pay an equivalent. We are informed by Mr. Lapslie, the minister of Campsie, Stirlingshire, in his statistical account of the parish, 1795, that his father, John Lapslie, was a farmer who paid black-mail in 1744 to M'Gregor of Glengye, the nephew of Rob Roy. The engagement was that he should make good losses, if the number of sheep stolen exceeded 7, for anything less was held as not a *hership* or *lifting*, but merely a *picking*. Early in 1745, 15 were stolen, and M'Gregor was honorably preparing to replace them, when the breaking out of the rebellion, in which he became involved, deprived him of the power of fulfilling his engagement, and likewise put an end to his self-created wardenship of the Highland borders. After that period, law was vigorously enforced in the Highlands, and black-mail ceased to be heard of.

BLACKMAN, GEORGE CURTIS, 1819–71; b. Conn., d. Ohio; graduate of the New York college of physicians and surgeons. In 1854 he became professor of surgery in the medical college of Ohio (Cincinnati), where he was known as a bold and skilful operator in some very difficult surgical cases. He was medical officer in the civil war, and was present at the battles of Shiloh and the Wilderness. He edited Velpeau's *Surgery*, with notes and additions.

BLACK MONDAY, the Easter Monday in 1351, when hail fell, and many people in England perished from cold. Also the Easter Monday (April 14, 1360) when Edward III. of England was with his army lying before Paris; a day so cold, dark, and stormy that many of his men and horses died from the effects. Shakespeare speaks of B.M. "It was not for nothing that my nose fell a-bleeding on black Monday last" (*Merchant of Venice*). In Australia, Feb. 27, 1865, got this name from a terrible sirocco that made great havoc over a wild region.

BLACKMORE, Sir RICHARD, one of the court physicians in the reigns of William III. and Anne, is remembered as the most heavy and voluminous poetaster of his own or any other age. He appears to have been a good and well-meaning man, and the merciless ridicule of contemporary wits was due, in some part at least, to the moral and religious tone of his works, and to his free censures of the libertinism of the time. But the worthlessness of the poems has been amply confirmed by the judgment of posterity. *The Creation*, considered his best, Addison pronounces "one of the most useful and noble productions in our English verse;" but few modern readers are likely to examine the grounds of this judgment, still less to agree with it. B. wrote six epics (choosing always the loftiest themes)—viz., *Prince Arthur*, in 10 books; *King Arthur*, in 12; *Eliza*, in 10; *Creation*, in 7; *Redemption*, in 6; *Alfred*, in 12; besides *The Nature of Man*, 3 books; a new version of the Psalms, paraphrases of Job, and other parts of the Bible, and a long list of theological, medical, and miscellaneous treatises.

BLACK MOUNTAINS, a portion of the Appalachians in North Carolina so called because of their dense evergreen vegetation. Some of the measurements are: Mt. Mitchell or Clingman's peak, 6701 ft. above tide; Guyot's peak, 6661; Sandoz Knob, 6612. Recent measurements show that there are about a dozen peaks in the B.M. that are higher than Mt. Washington (N. H.), whose elevation, 6285 ft., has usually been considered the highest e. of the Mississippi.

BLACK OAK, *Quercus tinctoria*, a species of oak valuable for the tannin furnished by its thick yellow bark, which yields quercitron. Sometimes it is called dyer's or yellow oak.

BLACKPOOL, a flourishing t. in the township of Layton-cum-Warbreck, in the co. of Lancaster, is now a very considerable place, lying on the coast of the Irish sea, between the estuaries of the Ribble and the Lune, distant from Poulton-le-Fylde 4 m., and from Preston 18 miles. The population in 1861 was 3506, and in 1871 it had increased to 6100; but the numbers who resort here during the bathing-season far exceed the permanently resident inhabitants. Upwards of 100,000 visitors annually come from e. Lancashire, Manchester, Yorkshire, and other parts of the kingdom. B. is one of the most frequented bathing-places in the w. of England, the sands being excellent. It has a branch railway connecting it with the Preston and Wyre railway, which affords easy access from Preston, Liverpool, Manchester, and all parts of the kingdom. There is also another railway connecting it with Lytham, another favorite bathing-place on the Ribble, about 7 m. to the south. B. has a fine pier, furnishing sitting accommodation to upwards of 3000 persons, which cost about £25,000; and a second, more recently opened, 500 yards in length. There are three established churches, a Roman Catholic chapel, and five other chapels for the Wesleyans, Independents, etc. Besides excellent streets and terraces of houses elegantly built, it has many large hotels (one of which, recently erected, cost upwards of £12,000); there is also a theater, libraries, news-rooms, etc. There is no trade or manufactures; the lodging-house keepers depend solely on the large concourse of visitors. Fishing is the employment of many during the winter months.

BLACK PRINCE, the name usually given in history to Edward Prince of Wales, son of Edward III. (q.v.).

BLACK QUARTER, syn. *Black Spald, Black Leg, Quarter Evil, Blood Striking;* incorrectly termed by some English writers *Inflammatory Fever*—termed by others *Hæmatosepsis* (Simonds) *Hæmatoclysis.*

Definition.—An apoplectic disease peculiar to cattle; a form of carbuncular disease, or anthrax—enzootic, i.e., limited to districts; not spread by contagion, but attended, especially in warm climates, and in Great Britain in hot weather, with the development of a blood-poison destructive to man and the lower animals. See MALIGNANT PUSTULE.

Causes.—Rich pasture on stiff, retentive, and undrained soil; sudden changes from poor to rich keep, particularly with animals in good health, predisposed to make blood or fatten fast. Youth predisposes to the disease, from the greater activity of the nutritive functions in early life. It is a disease confined almost entirely to yearling and two-year-old animals; the writer has, however, seen it in aged cows, etc. A young animal, thriving fast, may suddenly be seized with B. Q., if exposed to cold, showers, or a storm. A check thus induced to the organs of secretion, and particularly to the action of the skin, at once produces the blood-charge and apoplectic effusion peculiar to the disease. In various countries where calves are reared by the hand, and not allowed to suckle their mothers, there are many cases of quarter ill when the young animals are transferred from the stable or bare fields to rich grass-lands. The malady is chiefly witnessed in spring and autumn, particularly when animals are fed on strong autumn grass.

Symptoms.—The premonitory signs are often very insignificant, and usually overlooked. The healthy thriving aspect of a young steer, in a district where the disease prevails, excites the suspicion of the farmer. The animal may be observed with a sleek coat, voracious appetite, quick staring look, suddenly to stop feeding; the eyes become bloodshot; there is slight salivation or foaming at the mouth; and in the space of an hour or less, it will fall helpless, having manifested slight lameness in one of the limbs before dropping. In other cases, the animal suffers from swelling and pains, suddenly developed in one of the joints, whether the fetlocks, knees, or hocks, elbow, shoulder, or stifle. The swelling extends, and the animal falls. In both cases, the limb or *quarter* of the animal affected swells, the skin is bluish, the veins of the part are distended by black blood, and the creature is perfectly helpless. The suffering is unusually acute; but in many instances the respiration is tranquil, the pulse, however, oppressed and frequent. Animals in this state are costive at first, but occasionally violent diarrhœa supervenes, and the excrement is tinged by black extravasated blood. Death almost invariably supervenes in from 4 to 48 hours. Some cases prove lingering, especially if active and proper treatment be employed early; but recovery is rare. The symptoms of approaching death are convulsive twitchings of the muscles, fixed haggard look, grinding with the teeth, and spasmodic breathing. In some cases, the animal appears quite paralytic, and quietly breathes its last.

Post-mortem appearances.—The quarter affected is found, when cut into, soaked in black semi-coagulated blood. Similar blood is found in all the vessels of the body, and all the tissues have consequently a black congested appearance, particularly the lungs. The heart, as in all blood-diseases, is stained both externally and internally by black blood, effused beneath its serous covering or lining, and this appearance has led some veterinarians to believe the immediate cause of death to be inflammation of the heart. Such is not the case. The blood extravasations indicate the peculiar condition of the circulating fluid. In some cases in which a joint has been affected some hours before severe constitutional symptoms have appeared, the tissues around the joints are infiltrated by a yellow semi-solid exudation or lymph, which is capable of producing malignant pustule if inoculated in man or animals. Abscesses and sloughs are occasionally met with in and around the diseased joints.

Treatment.—In the earliest stage, blood-letting to the extent of 5 or 6 quarts. Administer half-ounce doses of niter in solution every half-hour for 4 or 5 hours. Give the animal much water to drink, and if chances of recovery are observed, 4-oz. doses of Mindererus's spirit, or solution of the acetate of ammonia, must be given every 4 hours. As the animal rallies, it may be desirable to administer a mild purge of Epsom or Glauber salts. The local treatment consists in incisions into the swollen parts, care being taken that the joints are not penetrated. The incisions must be washed with the following lotion: Chloride of zinc, 1 drachm; water, 12 ozs.; dissolve and apply with linen rag or lint, confining the moisture by gutta-percha or oil-silk. Treatment is not often successful, but we have the greatest facilities for

Prevention by deep drâining, whereby many pasture-lands have been rendered perfectly safe—after having repeatedly ruined tenant-farmers—from destruction by black quarter. In some hill-lands, where drainage does not appear the cause, the malady may be prevented by giving to all the cattle on the farm a weekly dose of an ounce of niter. The animals that thrive most rapidly should have the medicine rather more frequently, though not to such an extent as to reduce their condition.

The flesh of animals dying from this disease should not be used for human food. It

has destroyed whole families, and though in this cold climate accidents are rare, nevertheless they have occurred. Butchers have lost their arms, and persons have lost their lives from being inoculated in cutting up meat from oxen that have died of quarter ill.

BLACK RIVER, in n. New York, rising in the western part of the Adirondack region and running w. and n. to lake Ontario. In its course there are numerous falls and rapids furnishing abundant water-power to half a dozen villages, and the city of Watertown. The color of the water is about that of sherry wine. Boats pass from this river to the Erie canal through the Black river canal.

BLACK RIVER, or BIG BLACK, an affluent of White river, in Mo., flowing s. to the Arkansas border; about 350 m. long, and navigable for about 100 m. except in the dry season.

BLACK ROD, USHER OF THE, an officer of the house of lords, appointed by letters-patent. He is chief gentleman-usher to the sovereign, and belongs to the order of the Garter. His principal duty is (himself, or by his deputy the yeoman-usher) to summon the house of commons to the peers when the royal assent is given to bills, or when royal speeches are read; and to take into custody any peer guilty of breach of privilege. His income is devived from certain fees under the regulation of the house; and the appointment of messengers, door-keepers, servants, etc., rests with him. This patronage was at one time very lucrative, but new arrangements have made it much less so.

BLACK ROOD OF SCOTLAND. When the Anglo-Saxon princess who became the wife of king Malcolm Ceanmohr landed in Scotland, about the year 1070, she brought with her what was regarded as a priceless relic—a cross of gold, elaborately wrought, in the form of a casket, about a span long, containing what was believed to be a piece of the true cross, set in an ebony figure of the Saviour, richly decorated with gold. Of its earlier history, nothing is known; but St. Margaret bequeathed it as an inheritance to her children, and as she herself was at the point of death, we are told by her confessor, that she had it brought to her bedside, when she pressed it to her eyes and lips, and expired, clasping it with both her hands. The contemporary biographer of her son, king David I., relates that "the Black Rood of Scotland," as it was called, received the dying adoration of that saintly prince, and that it had then (in the middle of the 12th c.) come to be regarded by the whole nation of the Scots with mingled feelings of love and awe. It was kept as an heirloom of the kingdom, in the royal treasury in the castle of Edinburgh, and along with the other regalia and muniments of Scotland, was delivered up to king Edward I. in 1291. The irreverent scrutiny of the officers of the English king discovered that the outer case, which to the eyes of St. Aelred, in the previous century, seemed to be of the purest gold, was only silver gilt. But the relic itself was not the less venerable on that account; and it was used by king Edward to give increased solemnity to the oaths of fealty which he exacted from the magnates of Scotland. Thus, when the bishops of St. Andrews and of Glasgow sided with Bruce, it was urged as a heinous aggravation of their guilt, that they had sworn "upon the body of Christ (i.e., the sacrament of the eucharist), and upon the holy gospels, and upon the cross of St. Neot, and upon the B. R. of S.," to be true and faithful to the English king and his heirs for ever. When the long struggle between England and Scotland was at last ended by the peace of Northampton in 1328, the Black Rood was restored to Scotland as one of the national treasures. But it was not destined to remain long in the north. When the hapless king David II. invaded England in 1346, he carried the black rood with him, in the belief (common in that age) that such a holy relic would insure safety to his person or victory to his arms. On his defeat and capture under the walls of Durham, the B. R. of S. became the prize of his conqueror, sir Ralph de Neville, lord of Raby, by whom, along with other spoils of the battle, it was offered up at the shrine of St. Cuthbert, in the cathedral of Durham. There it hung till the reformation, when all trace of it disappears.

BLACK, or EUXINE SEA (the *Pontus Euxinus*), or "hospitable sea" of the ancients, the Kara Deniz of the Turks, the Mauri Thalassa of the modern Greeks, and the Tschernoje Moré of the Russians) is an inland sea lying between Europe and Asia, extending from lat. 40° 45′ to 46° 45′ n., and from long. 27° 30′ to 41° 50′ east. In shape it bears a certain resemblance to the human foot. Its greatest length from e. to w., on the 42d parallel, is about 700 m., and its greatest breadth, near the w. end, about 380 miles. Area, 172,000 sq. miles. On the south-western extremity it communicates by the Bosporus, the sea of Marmora, and the Dardanelles, with the Mediterranean, and on the n.e. by the straits of Yenikale with the sea of Azof. The B. S. drains nearly one fourth of the surface of Europe, and also about 100,000 sq.m. of Asia. Throughout its whole extent it has but one island, and that a small one, lying opposite the mouths of the Danube, called *Adassi*, or isle of serpents, on which is a light-house. The continued occupation of this island by the Russians, in defiance of the stipulations of the treaty signed at Paris after the termination of the Crimean war, occasioned considerable uneasiness in Turkey, and detained a British fleet in the B. S. for several months. In the center of the B. S. there are no soundings at 150 fathoms, nor are there shoals along the shores, except at the entrance of the Bosporus; the navigation of the B. S. ought, therefore, to be particularly easy and safe. It is so in summer; but in winter, being inclosed on

every side, it becomes the scene of conflicting winds, and of storms which, though of short duration, are terrible while they last. Such a storm it was on the 14th of Nov., 1854, in which about forty vessels of the allies were either totally wrecked or very seriously injured; nearly 1000 lives were lost, and property worth some millions destroyed.

All the coasts are high, with good harbors, except between the mouths of the Danube and the Crimea; there the land is low, and the danger of navigation greatly increased in winter by the presence of floating ice; for, from the many large rivers which flow into the B. S. and sea of Azof (Danube, Dniester, Bug, Dnieper, Don, and Kuban, in Europe; and the Kizil-Irmak and Sakara in Asia), the waters are fresher, and consequently more easily frozen than those of the Mediterranean. The specific gravity of the water of the B. S. is 1014 (water being = 1000), while that of the Mediterranean is 1028. The shores from Odessa to the Crimea are ice-bound during Jan. and Feb.; and although the harbor of Odessa is never frozen up, yet the drift-ice frequently renders the entrance to it dangerous.

There is no tide in the B. S., but the large rivers flowing into it give rise to currents, which are particularly strong in spring when the snows melt, and the accumulated moisture of the whole winter is drained off the land. The great current which, passing out of the sea of Azof round the Crimea, flows first in a south-westerly, then in a north-westerly direction, and again due west, is turned southwards by a current from the Dnieper and Dniester; the two currents are afterwards met by another from the Danube, and then, all united, rush towards the Bosporus. The Bosporus, however, is not wide enough to admit the entire volume of water pressing into it; and a portion of the main current is consequently diverted to the coast of Asia, where it is strengthened by new accessions. This, which is the normal course of the currents in the B. S., is modified by the winds, and by local circumstances. In some bays of Roumelia and Bulgaria counter-currents have been observed. The most important ports on the B. S. are those of Odessa, Kherson, Eupatoria, Sebastopol, Batum, Trebizond, Samsun, Sinope, Varna, etc.

The depth of the water is unfavorable to the extensive establishment of fisheries, but several kinds of sturgeon are caught in considerable quantities in the straits of Yenikale. Other fish of various kinds are said to be abundant.

The ancients believed that the B. S. was at one time much more extensive, and that it had no connection with the Mediterranean. They accounted for its decrease and communication with the larger sea by the supposition that the Thracian Bosporus had been burst through by an earthquake, or by the great deluge known as the Deucalion deluge, which inundated Greece. The B. S. being higher than the Mediterranean, the latter, of course through the newly created channel, became the basin for much of its waters. Certain geological and other appearances have led some modern geographers to entertain an opinion similar to that of the old Greeks, which, however, is not shared in by others.

The B. S. has been navigated from a very early period. Its original name (supposed to have arisen from the dangers such an expanse of sea offered to early navigation, as well as from the fact that savage tribes dwelt upon its coasts) was *Axine*, or "inhospitable" sea, afterwards changed by the Greeks to *Euxinus*. In the time of Xerxes, large quantities of corn were exported from its ports to Athens and the Peloponnesus. The Romans and Byzantine emperors, and also the Genoese, had large traffic on the Black sea. When the Turks captured Constantinople, all but their own ships were excluded from its waters until the treaty of Kinarji, 1774, when the Russians obtained the right to trade in it. Ten years after, Austrian ships were privileged to trade here; and by the peace of Amiens, in 1802, British and French ships were admitted. The undue preponderance of Russia in the B. S. was the main cause of the Crimean war.

BLACK SILVER, an ore of sulphur, antimony, and silver, found with other silver ores in Saxony, in the Hartz mountains, in Mexico, in the Comstock lode (Nevada), in Idaho, and other places. It is sometimes called Stephanite, and its composition is sulphur, 16.2; antimony, 15.3; silver, 68 5.

BLACK SNAKE, (*coluber constrictor*, see COLUBER), a species of snake common in the United States of America, from Louisiana to Connecticut. It is of an almost uniform leaden color, is one of the largest serpents in North America, and is remarkable for its great agility. It moves along the ground with a swiftness equal to that of a horse, glides over bushes, and climbs trees. It feeds on small quadrupeds, birds, frogs, etc.; frequently plunders poultry-yards of eggs; and enters dairies to drink milk or cream, of which it is very fond, but compensates for these depredations by killing rats and mice. It has no poison-fangs, but is not slow to bite. It is very capable of domestication.

BLACKSTONE, a t. in Worcester co., Mass., 36 m. s.w. of Boston; on the Providence and Worcester, and Boston, Hartford and Erie railroads; pop. '80, 4,908. The chief business is cotton and woolen manufacturing.

BLACKSTONE, WILLIAM, the first white man who settled on the site of the present city of Boston, about 1623. Ten years afterwards he removed to Rhode Island. It is believed that he was an English clergyman, a graduate of Emmanuel college.

BLACKSTONE, Sir WILLIAM, a commentator on English law, was the posthumous son of a silk-mercer in London, and was born there on the 10th of July, 1723. At the age of 15, having obtained a scholarship from the charterhouse school, where he was educated,

he was sent to Pembroke hall, Oxford. There he was fortunate enough to obtain a second scholarship, and remained till, in 1744, he was admitted a fellow of All Souls' college, when he removed to London, to attend the courts of law with the view of qualifying himself for his future profession. In 1746, at the age of 23, he was called to the bar, but failed to attract either notice or practice. Upon the death of an uncle in 1749, he was appointed recorder of Wallingford, in Berkshire; but in 1753 he went to Oxford, where he delivered a course of academic lectures upon the law of England. A few years later, a Mr. Viner having left a sum of money to endow a chair of English law in the university of Oxford, B. was, in 1758, appointed first Vinerian professor. The following year, B. returned to Westminster; and as the doctrines which he had taught as a lecturer had been such as to commend him to the notice of the tory government of that day, he obtained its patronage, and in 1761 was made a king's counsel. Shortly after, he was appointed principal of New Inn hall, Oxford. Other honors followed fast, and he became successively member of parliament, bencher of the Middle Temple, and solicitor-general to the queen. In 1765, B. published the first volume of his lectures, and the remaining three volumes between that date and 1769. These lectures form his celebrated *Commentaries on the Laws of England*. His practice continuing to increase, he resigned, in 1766, his Oxford appointments. Four years later, he was offered the solicitor-generalship, and after declining it, was knighted, and made a justice of the court of common pleas. The remaining years of his life were spent in the discharge of his duties as a judge. He died on the 14th of Feb., 1780, at the age of fifty-seven.

The fame of B. rests entirely upon his *Commentaries*. His other literary works were inconsiderable, and his merits as a pleader or judge were not such as, of themselves, to have made his reputation outlive himself. As a commentator, he had many excellences. His style was in general clear and gracefully ornate, and his illustrations pleasing and felicitous. While he confined himself to exposition—to the accurate statement in scholarlike English of what had heretofore lain buried in the cumbrous language of lawyers like Littleton—B. was unsurpassed, and rendered an important service to the country. But he was ambitious of combining with this exposition the higher task of explaining the reasons for the law, as well as its merits and defects. For this survey of the law, from the legislator's point of view, he had not the requisite qualifications. His knowledge of English history was, as Hallam tells us, superficial, and his study of the philosophy of law had been imperfect. With the works, indeed, of Montesquieu and Beccaria he was acquainted; but the mode in which he quotes them shows that he had imbibed nothing of their spirit. The method followed in the *Commentaries* was as unscientific as could be imagined, and had not even the merit of originality. It was taken, with little alteration, and no improvement, from Sir Matthew Hale's *Analysis of the English Law*. Possibly the haste with which the *Commentaries* must have been composed, being originally in the form of lectures, may have led to some of their imperfections. Since B.'s death, the *Commentaries* have been very frequently reprinted, perhaps the best editions being those of Christian. As a century has elapsed since they were composed, so many alterations are requisite to adapt them to the existing state of the law, that it may be said that their purpose has been served, and that they are now valuable chiefly as materials for history.

BLACK STONE EXAMINATION. See GLASGOW UNIVERSITY.

BLACKSTONE RIVER, rises in Worcester co., Mass., and runs into Rhode Island, where its name is changed to the Pawtucket. It furnishes water-power to a continuous line of villages and hamlets along its shores. The B. canal, finished in 1823, is disused, having been supplanted by railroads.

BLACK VOMIT, the dark mucous matter thrown up in yellow fever, and usually a sign of fatal termination of the disease. It is in part coagulated blood blackened by an acid generated in the system. The fever itself is often called the black vomit.

BLACK WAD is a name given by miners to the native black oxide of manganese, and principally to an impure and earthy variety of the ore. See MANGANESE.

BLACKWALL, a suburb of London, in Middlesex, at the junction of the Lee with the Thames, 4 m. e.s.e. of the metropolis. It has foundries, ship-building yards, and the East and West India docks. A railway 4 m. long, mostly on a brick viaduct above the streets, connects B. with the city of London. To avoid the dangers and delay of the "pool," many passengers proceed by this railway to embark in steamers at B., instead of going on board at London bridge.

BLACK WARRIOR, a river formed in the n. of Alabama, by the junction of the Mulberry and the Locust. Almost from the very point of confluence it is navigable for steam-boats, till, after a course of more than 150 m., it enters the Tombigbee, which, again, is navigable for large vessels all the way to Mobile on the gulf of Mexico, a stretch of nearly 200 m. more. Its banks yield coal, iron, and other valuable minerals.

BLACK WATCH, the appellation given to certain armed companies employed to watch the highlands of Scotland. The term *black* arose from the dress of this species of militia, which was composed of tartans of dark colors. Some highlanders had been armed by government as early as 1725, when gen. Wade was appointed commander-in-chief in Scotland; but it was not till about 1729 or 1730 that the companies assumed a regular

form. The companies were six in number—three comprising 100 men each, commanded by a captain; and three of 70 men each, commanded by capt.-lieuts. Stationed in different parts of the highlands, and acting independently of each other, they were styled the independent companies of the black watch. The body was raised chiefly from the whig or loyal clans—Campbells, Grants, Munros, etc.—and many men of good station in society joined it, not only for the sake of good pay, but for the valued privilege of bearing arms. The duties of the B. W. were to enforce the disarming act, to overawe the disaffected, to prevent political meetings of a seditious kind, and to check depredations among the clans, or on the lowland frontier. After being of considerable use for these local purposes, the whole of the companies were formed into the 42d regiment, under the command of the earl of Crawford, in 1739—their removal giving facility, no doubt, for the outbreak of the rebellion in 1745. Retaining its original highland character, the 42d regiment became one of the most distinguished corps in the British army; the whole of its history, for which we would refer to the work of col. Stewart on highland regiments, being a series of brilliant achievements. Embodied under the earl of Crawford, the regiment would have adopted the tartan of that nobleman, if he had possessed such a cognizance; the earl, however, being a lowlander, it was necessary to adopt an arbitrary pattern of tartan, which has ever since been known as the 42d or B. W. tartan. See TARTAN.

BLACK-WATER, a disease in cattle. See DARN.

BLACKWATER, the name of five Irish rivers, two of which deserve notice.—1. The B. of Cork co. rises in the w. of Kerry co.; runs e. across Cork co. and the w. part of Waterford co., in a carboniferous limestone basin, past Millstreet, Mallow, Fermoy, Lismore, and Cappoquin, and enters the sea at Youghal harbor. High mountains bound it on the s., and its chief feeders come from the north. It has a course of 100 m., and is the seventh in size of the Irish rivers. The scenery along its banks is highly beautiful and picturesque, with ruins, mansions, and woods. It is navigable for barges for the last 15 m. of its course. It abounds in salmon.—2. The B. of Ulster rises on the confines of Tyrone and Fermanagh cos.; runs first s.e., and then n.w. through Tyrone; and then between Tyrone, Monaghan, and Armagh, past Caledon and Charlemont, and falls into the s.w. corner of Lough Neagh.

BLACKWELL, ALEXANDER, a physician of great natural genius, son of the Rev. Thomas B., one of the ministers of Aberdeen and principal of Marischal college, was b. in that city in the beginning of the 18th century. He studied physic under Boerhaave at Leyden, where he took the degree of M.D. He was afterwards a printer in London, but becoming bankrupt in 1734, was supported in prison by his wife, who prepared and published a *Herbal* (2 vols. folio, 1737–39) with 500 cuts of plants, drawn, engraved, and colored by herself, her husband adding their Latin names, with a brief description of each. The work, patronized by the college of physicians, met with great success, and B. obtained his release. A work on agriculture, published by him, falling under the notice of the king of Sweden, B. was invited to Stockholm in 1740, and received apartments in the house of the prime minister, with a pension. Having cured the king of a dangerous illness, he was appointed one of the royal physicians; but while in the full enjoyment of court favor, he was charged with being concerned in a plot with count Tessin against the king and government, and after being subjected to the torture, was broken on the wheel, Aug. 9, 1748, protesting his innocence to the last. A genus of plants, *Blackwellia*, is named in honor of Mrs. Blackwell.

BLACKWELL, ANTOINETTE L. BROWN, b. 1825. She studied theology at Oberlin, and was ordained pastor of a Congregational church in 1853. She retired from this work after a few years, and is a prominent leader in "woman's rights" and other social questions. She married Samuel C. Blackwell in 1856.

BLACKWELL, ELIZABETH, M.D., a medical practitioner in New York, U.S.—the first woman that ever obtained a medical diploma—was b. at Bristol, where her father carried on an extensive business as a sugar-refiner, in the year 1821. Circumstances afterwards induced the family to emigrate to New York, and then to push west to Cincinnati, where, in 1838, the father died, leaving a widow and family of nine children but scantily provided for. Miss B., who was at this time in her 18th year, and who had already been distinguished by unusual decision of character, immediately, along with two elder sisters, opened a boarding-school, which soon gained a reputation, and had a large attendance. But the spirit of Miss B. chafed at the limitations which society had imposed on the energies of women, and she often took counsel with her sisters as to the practicability of storming the learned professions, and thus enlarging woman's sphere. At length, in 1844, the school was given up, Miss B. determining to become the medical apostle of her sex. After three years' further work as a salaried teacher, which she undertook in order that she might have the pecuniary means wherewith to prosecute her medical studies, and during which time she devoted the whole of her leisure to the study of medical and anatomical books, she went to Philadelphia, where she applied in vain for admission into the medical schools. Failing this, she entered on a course of private anatomical study and dissection and of midwifery with prof. Allen and Dr. Warrington of Philadelphia. After strenuous efforts, she at last obtained admission to

a university—that of Geneva, in New York state—and thither she accordingly repaired in the Nov. of 1847. Here she remained until Jan., 1849, when she graduated with the highest honor. During the two years of her study, she conducted herself with a propriety and discretion that gained for her the esteem and respect of all her fellow-students. Only once was an insult offered to her. It was in the class-room, and she repelled it with so quiet a dignity as to bring down the applause of the students on herself, and their hisses on her despicable assailant. Her presence had a beneficial effect upon the students; her "brilliant example," as the president called it, had stimulated them to greater effort, and their general conduct and attainments during the sessions she was at college were better than usual. Shortly after her graduation, Miss B. visited Europe, in order to the further prosecution of her medical studies. At Paris, she was told that it would be impossible for her to gain entrance to the schools or hospitals there, unless she adopted male attire; a suggestion which she refused to act on, as it was alike repugnant to her taste, and to the great object she had in view—viz., the recognition of female doctors. After much perseverance, she was at length admitted into the extensive lying-in hospital of the *Maternité*, and was permitted to visit other hospitals. After studying at St. Bartholomew's hospital, and the Woman's hospital, London, she returned to New York in 1851, and there established herself in practice. At first difficulties were thrown in her way by physicians of the opposite sex refusing to meet her in consultation; but these were soon overcome, and Miss B. was soon established in excellent practice. In 1852, she delivered a series of lectures to ladies on health and physical development; in the following year she published a work, entitled *The Laws of Life, considered with Reference to the Physical Education of Girls*, and also established a dispensary for women and children, which proved so successful that she was induced, in 1857, to open a small hospital for women. Miss B.'s sister, now Dr. Emily B., has followed in the footsteps of Elizabeth.

BLACKWELL, Lucy Stone, b. Mass., 1818; graduated at Oberlin college. She took an early interest in the anti-slavery cause, and was prominent in the work as a lecturer and agent. In 1855, she was married to Henry B. Blackwell, an English gentleman. Since that time she has resided in Orange, N. J., and is now in Dorchester, Mass. She is known as an ardent advocate of suffrage and other rights for women.

BLACKWELL, Thomas, a scholar of some eminence, brother of Alexander B. (q.v.), b. at Aberdeen, Aug. 4, 1701, studied Greek and philosophy in Marischal college, and took the degree of M.A. in 1718. In Dec., 1723, he was appointed professor of Greek in Marischal college, and in 1737 published anonymously at London an *Inquiry into the Life and Writings of Homer*, 8vo, 2d edition, 1746, and shortly afterwards, *Proofs of the Inquiry into Homer's Life and Writings*. In 1748, he published, also anonymously, *Letters concerning Mythology*, 8vo. The same year he was made principal of Marischal college; and at the commencement of the session 1752, on his recommendation, a new order in teaching the sciences was introduced into the college. In 1753, he published the first volume of his *Memoirs of the Court of Augustus*, 4to. The second volume appeared in 1755; and the third, left unfinished by him, was completed by John Mills in 1764. He died March 8, 1757. A chemical professorship was founded by his widow in Marischal college in 1793, and also a biennial award of £20 (the "Blackwell prize"), open to any one, for the best essay on a subject proposed by the principal and professors of Marischal college.

BLACKWELL'S ISLAND, a narrow strip of rocks in the East river, between New York and Long island, about 1½ m. long by ¼ m. wide; used exclusively for the penal institutions and hospitals under charge of the city of New York. (See New York City.)

BLACKWOOD, William, a distinguished Edinburgh publisher, the originator of *Blackwood's Magazine*, was b. in Edinburgh, Nov. 20, 1776. After serving his apprenticeship to the bookselling business in his native city, and prosecuting his calling in Glasgow and London, he settled in Edinburgh as a bookseller—principally of old books—in 1804. In 1817, at which time he had become a publisher on his own account, he issued the first number of *Blackwood's Magazine*. The literary ability displayed in this periodical was so much in advance of the monthly magazines then existing, that from the first it was a great success. Its remarkable popularity was sustained by the papers of John Wilson (q.v.) and J. G. Lockhart (q.v.), also of James Hogg (q.v.), and other spirits, whom B. had the liberality and tact to attract to his standard. Overwhelming its political and literary opponents, now with the most farcical humor, and now with the bitterest sarcasm—sometimes with reckless injustice—the magazine secured for itself a prodigious reputation, more particularly among the tories, of whose political creed it has always been a resolute adherent. We believe it can hardly be said that *Blackwood's Magazine* has ever had any distinct editor. William Blackwood himself, who added literary tastes and acquirements to his profession of a bookseller, was the chief manager of his magazine, and conducted the whole of the correspondence connected with it until his death, which took place Sept. 16, 1834. Under his sons, the Messrs. B., who succeeded him in the business, *Maga* has not only sustained but increased its reputation; the places of its old contributors are supplied by many of the most distinguished men of letters in the country. In the conduct of the magazine, the late prof. W. E. Aytoun was

understood to occupy a position in relation to the publishers somewhat analogous to that which Wilson held under their father. The publishing business, which includes that of printing the works issued, has been greatly extended by the Messrs. B., who have a name second to none in the kingdom.

BLACKWOOD RIVER, in w. Australia, enters the Hardy inlet, 6 m. to the n.e. of Augusta, in lat. 34° 14′ s., and long. 115° 12′ east. It flows through the counties Durham and Nelson, first to the w., and then to the s., traversing a district of wood and pasturage. It is navigable for boats to a distance of 20 m. from the sea.

BLADDER (urinary) is a bag formed of fibrous membrane externally, muscular fibers in the middle, and mucous membrane for an internal lining. The peritoneum (see ABDOMEN) covers its back. The shape of the B. is somewhat conical, the *apex* being upwards, and the anterior part of the *base* constricted at the commencement of the urethra, called the *neck* of the bladder. On each side, rather below its middle, open the two ducts from the kidneys (the ureters); an imaginary line drawn between them, and from each end of this line others drawn to the neck of the bladder include an equilateral triangle. In this space, which is called the *trigone*, the mucous membrane is not thrown into folds, but is smooth and very sensitive, the slightest touch upon it giving rise to a desire for micturition. The habit of some children to empty their bladders when sleeping on their backs, is supposed to be due to the urine accumulating in this part, as is also the distressing pain of stone.

The B. is situated in the pelvis in adults, but much higher in the young. It is kept in position by four true or membranous ligaments, and false ligaments formed of folds of the peritoneum. The neck of the B. is surrounded by the prostate gland, and here the urethra (q.v.) begins. Like all cavities lined by mucous membrane, the B. is subject to catarrhal inflammations, which are accompanied by an increased secretion of mucus, rendering the urine turbid, frequent and painful desire to micturate, and very great constitutional disturbance. The symptoms may be acute, and must be relieved by local bleeding, and hot fomentations along with opiates; or they may be chronic, when some medicines, as the *uva-ursi* (see ARBUTUS), bucku (q.v.), the preparations of iron, and the mineral acids, are found useful. If there is much mucus, or decomposed urine in the B., it may be washed out with warm water, in which a minute quantity of nitric acid has been dropped. Of course, if there is any known cause for this inflammation, as a stone, it must be removed.

Irritable B. resembles the former disease, but is produced by various causes unaccompanied by inflammation. Some persons, from mere nervousness, are frequently troubled with a desire to pass water; and strange as it may seem, many in this condition never effectually empty their bladders, always leaving a portion, which keeps up the irritation. This condition frequently arises from the habit of retaining the urine so long as to over-distend and weaken the muscular walls of the B.; but it may be induced by general debility, the irritation of worms, cold, or an irritating state of the urine itself. The best treatment is tonics, and soothing the irritability with sedatives. When this irritability is nocturnal, it may be from the patient lying on the back, as explained above; it generally occurs in delicate children, and is more a habit than a disease.

Paralysis of the B. may be the result of accident, or disease of the nervous centers, or over-distension; in this condition the urine accumulates and dribbles away, and must be drawn off by the catheter (q.v.). This dribbling, or *incontinence*, must be carefully distinguished from irritable B., as it is in nearly every case the sign of a distended bladder. *Retention* of the urine may be caused by mechanical obstacles to its exit, by paralysis, or by an absence of volitional power over the muscles. This last is termed *hysterical* retention, and is common in young girls, in persons suffering from sea-sickness, from being in a strange place, an accident, such as a broken leg, etc. If the affection is not encouraged by an officious use of the catheter, the power generally soon returns. Any long-continued difficulty in passing water is generally followed by a thickening of the walls of the B. itself, or *hypertrophy*. The mucous membrane may form pouches in these thickened walls, which is called *sacculated* B., and cancerous diseases, and tubercle, may also attack this organ.

The B. is liable to be ruptured by accident from without, as, for instance, by a blow or hurt from a saddle; and as this accident is usually fatal, it cannot be too carefully guarded against. If the B. is ruptured posteriorly, the accident is always fatal.

BLADDER CAMPION. See SILENE.

BLADDER GREEN. See BUCKTHORN.

BLADDER-NUT, *Staphylea*, a genus of plants which, according to some botanists, is the type of a small natural order, *staphyleaceæ*, by others, united with *celastraceæ*. See SPINDLE TREE. The *staphyleaceæ* have usually opposite pinnate leaves, the leaflets of which, as well as the leaves themselves, have deciduous stipules. The sepals, petals, and stamens are equal (five) in number. Only about 14 species are known, which are found in very different climates, and scattered over the world. They are mostly small trees of rather elegant appearance. The seeds contain a considerable quantity of a fixed oil, which is slightly purgative. The common B. (*staphylea pinnata*) is a native of the e. of Europe, and of temperate parts of Asia, which has been admitted into the British

flora, but has in all probability been introduced as an ornamental tree. It is frequently planted in shrubberies, as is also *S. trifolia*, a North American species with ternate leaves. The wood of both is firm and white, well suited for the purposes of the turner. The seeds may be eaten, but act as a mild aperient. The flower-buds are pickled as capers. The name B. has reference to the curious inflated membranous capsule, and the hard bony *testa* of the seed. The name *staphylea* is from the Greek *staphylē*, a bunch of grapes, and has reference to the racemed flowers.

BLADDERWORT, *Utricularia*, a genus of plants of the natural order *lentibulariaceæ* (q.v.), containing a large number of species, the bright blossoms of which, along with those of water-lilies, etc., adorn the surface of lakes, ditches, and marshes in almost all parts of the world. They are particularly abundant within the tropics, and many are natives of Australia. Britain produces only three species, all of which have yellow flowers. These plants are very interesting from the provision made for the expansion of their flowers above water, although the whole plant is ordinarily submerged. The roots, stems, and even leaves, are furnished with numerous little bladders or vesicles, which are filled with water till it is necessary that the plant should rise for the expansion of the flowers, when they become filled with air; and this again gives place to water after flowering is over, so that the seeds are ripened at the bottom. The bladders, at least of *U. vulgaris*, have an orifice closed by a very thin elastic valve opening inwards. Aquatic insects sometimes enter them, and are imprisoned.

BLADEN, a co. in s.e. North Carolina on Cape Fear and South rivers; traversed by the Carolina Central railroad; 800 sq.m.; pop. '70, 12,831—6102 colored. It is level, with extensive pine-forests; productions, corn, rice, sweet potatoes, etc. Co. seat, Elizabethtown.

BLADENSBURG, a post-t. of Maryland, on the e. branch of the Potomac, and on the Washington and Baltimore railway. It is 6 m. to the n.e. of Washington; and it was here that the battle which decided the fate of that city was won by the British on the 24th Aug., 1814.

BLAEBERRY. See WHORTLEBERRY.

BLAES, a Scottish colliers' name for the shale of the coal-measures, originating apparently from the "blae" or bluish color sometimes noticed in the shale. The term is occasionally used by geologists.

BLAEU, also BLAEUW and BLAUW (Lat. *Cæsius*), the name of a family of learned Dutch publishers who have rendered as important services to literature and art as Aldus, Giunti, Stephanus, or Elzevir, and whose activity spread itself over Europe for a century.

BLAEU, WILH., a mathematician, map-drawer, and publisher, was b. at Alkmaar, in Holland, in 1571. He belonged to the school of Tycho Brahé, and secured a considerable reputation by publishing a terrestrial and a celestial globe, excelling in beauty and accuracy everything that had preceded them; and also several maps, which indicated a comparatively precise knowledge of geography. As a printer, he did not attain the elegance and completeness of Elzevir, but nevertheless his chief publications are marked by a fine external finish, and a praiseworthy correctness. He died 18th Oct., 1638, and left two sons, John and Cornelius, who carried on the business together until the death of the latter in 1650.

BLAEU, JOH., the son of the preceding, was b. at Amsterdam about the beginning of the 17th century. He commenced business on his own account at Amsterdam, but afterwards entered into company with his father. His *Atlas Major*, in 11 vols. of the size in which atlases are published at the present day, is a splendid work. It is full of archæological and geographical information, supplied for each country by men of eminence connected with it. There are many curious plates—among them a representation of Tycho in his observatory—and the maps are extremely valuable from the light they throw on local history. Besides this, he published a series of singularly rich topographical plates and views of towns, which are consulted even to the present day. He died about 1680, leaving three sons, Joh., Wilh., and Peter, the second of whom became a member of the Amsterdam council, while the other two carried on with distinction and success the paternal business. Some of their classical publications, especially Cicero's *Orationes* (1699), are still highly prized.

BLAGOVIESHTCHENSK, a t. in Asiatic Russia, the capital of the province of Amoor, on the A. river and the Dzega; pop. 3107.

BLAINE, EPHRAIM, 1741–1804; commissary general in the revolutionary army under Washington. His exertions during the dreadful winter at Valley Forge went far towards saving the suffering army from starvation.

BLAINE, JAMES GILLESPIE, b. Penn., 1830. His first education was in the common schools, and at the age of 17 he graduated at Washington college in Pennsylvania. Very soon afterwards he removed to Maine, became a writer on the *Kennebec Journal*, one of the leading papers of the state, and within a brief period the editor of the *Portland Advertiser*, one of the oldest and most influential papers in the east. He was an able and accomplished writer, and won an excellent reputation. In the natural course of

editorial life he became a politician, and identified himself with the republican party from its commencement. His first political advancement was to the lower house of the Maine legislature, where he served four years with honor, and increased his rising fame. In his third term he was elected speaker, and so continued for two years. At the outbreak of the war of the rebellion he was among the earliest and most zealous in advocating a vigorous course on the part of the government, and was especially active in raising and organizing troops for the union army. In 1862, he was elected to congress as a republican, and immediately took a place in the front ranks of the party's representatives. His support of the war to preserve the union was no less zealous than that of senator Morton; the preservation of the union was his controlling idea, and he urged it with all his power. He was re-elected in 1864, in 1866, and in 1868. When the struggle was over he was conspicuous in the measures for reconstruction, and he was the author of the proviso that any state in the south should have a full restoration of its original rights and privileges upon the sole condition that it should ratify the amendments to the constitution. During the presidential canvass of 1868, he was among the foremost and most effective of republican advocates, and had the pleasure of carrying his own state by a larger majority than was ever before given for a presidential candidate. In the same year, he was re-chosen to congress by an immense majority. His six years of service in the house of representatives made him the proper successor for speaker, and he was elected. His nomination was made by Elihu B. Washburne, of Illinois, and the vote was—for Blaine, 136; for Kerr (democrat), 57. In 1876, he was elected to the U. S. senate, where he is now one of the most conspicuous members. While this article is in construction Mr. Blaine stands among the foremost of those who are considered probable nominees of the republican party for president of the United States. There are in him certain elements of magnetism that have been unknown since the days of Henry Clay, and no public man has a more ardent and enthusiastic following.

BLAINVILLE, Henri Marie Ducrotay de, a distinguished French zoologist and anatomist, was b. 12th Sept., 1778, at Arques, near Dieppe. At an early period, he went to Paris, where he devoted himself to the study of medicine and the physical sciences, and took the degree of doctor in 1808. Through Cuvier chiefly, he was induced to study natural history and comparative anatomy. In 1812, he was appointed assistant-professor of comparative zoology, anatomy, and physiology in the university of Paris, as well as professor of natural history at the athenæum; in 1825, a member of the institute; and in 1832, successor of Cuvier in the chair of comparative anatomy in the museum of natural history. He died May 1, 1850. B. achieved great success, not only as a teacher, but as an author. Besides various small treatises which appeared in scientific journals, he published many large and valuable works, all of which have greatly advanced our knowledge of the various sciences they treat of; such as *Faune Française* (1821–30), *De l'Organisation des Animaux* (1822), *Cours de Physiologie Générale et Comparée* (1833), *Ostéographie* (1839–49), *Manuel de Malacologie et de Conchyliologie* (1825–27), *Manuel d'Actinologie et de Zoophytologie* (1834–37).

BLAIR, a co. in central Pennsylvania, on the Juniata; intersected by branches of the Pennsylvania railroad; 650 sq.m.; pop. '70, 38,051; in '80, 52,720. The Alleghany and other mountains make the surface very rough, but there are well cultivated valleys, and mines of iron and bituminous coal. Productions chiefly agricultural. Co. seat, Hollidaysburg.

BLAIR, Francis Preston, 1791–1876; b. Virginia; educated at Transylvania university, and studied but never practiced law. By opposing the nullification movement in South Carolina, he attracted the notice of president Andrew Jackson, who induced him to assume the editorship of *The Globe*, a democratic journal started at the seat of government. The paper began 1830, and was controlled by Blair till 1845, when he was offered the mission to Spain. This he declined, and returned to his estate in Maryland, soon afterwards leaving the old democratic party and supporting the free-soil movement, which naturally brought him into the republican party.

BLAIR, Francis Preston, jr., b. Kentucky, 1821; son of Francis Preston, sr.; graduated at Princeton in 1841, and began the practice of law with his father in St. Louis. He was prominent in the free-soil party that supported Van Buren for president, and was for a time editor of the *Missouri Democrat*. In 1852 and 1854 he was elected to the Missouri legislature; in 1856, elected to congress as a republican; and re-elected in 1860 and 1862. He entered the union army in 1861, rose to brig.gen. in 1863, and resigned his seat in congress. He served through the war, being with Sherman on the "march to the sea." In 1866, he was made collector at St. Louis, and Pacific railroad commissioner. In 1868, he abandoned the republicans and became the democratic candidate for vice-president. In 1870, he was sent to the U. S. senate from Missouri, and at the close of his term of service he returned to private life.

BLAIR, Hugh, an eminent Scotch divine and man of letters, was b. at Edinburgh, April 7, 1718. He entered the university of his native city in 1730, where he soon became noted for his diligence; and an *Essay on the Beautiful*, which he wrote when a student, gave his preceptors a high idea of his ability and taste. In Oct., 1741, B. was licensed as a preacher of the Established church; and after occupying successively the churches

of Colessie in Fifeshire, Canongate church in Edinburgh, and Lady Yester's, he was promoted in 1758 to the highest position attainable by a Scotch clergyman—one of the charges of the High church, Edinburgh. His discourses, which display little power or originality of thought, and which derived nothing from the delivery of their author, were greatly admired by "persons of the most distinguished character and eminent rank" in Scotland on account of their polished style. In 1759, B. commenced a series of lectures on *Composition* to classes in the university, and three years afterwards, a new chair of rhetoric and belles-lettres, with a salary of £70 a year, being created by the crown, B. was made professor. He held this appointment until 1783, when he resigned; and in the same year published his *Lectures*, which obtained a reputation far beyond their merits, and one that time has by no means sanctioned. His first volume of *Sermons* appeared in 1777, with the approval of Dr. Johnson, who had read them, and proved a great success. George III. showed his appreciation of them by bestowing on B., in 1780, a pension of £200 a year. He also published three other volumes of *Sermons*, and prepared a fourth, which was printed after his death, which took place Dec. 27, 1799. They were all as successful as the first one. Opinion about their merits has much changed since the date of their publication; they are now considered as moral essays rather than sermons. B.'s critical acumen was not great; he believed in the authenticity of Ossian's poems, which he strenuously defended.

BLAIR, JAMES, D.D., 1656–1743; b. Scotland. He was sent in 1685 by the bishop of London as a missionary to Virginia, and in 1689 was made the highest ecclesiastical officer of the colony. After long efforts, in 1692, he founded William and Mary college, of which he was first president. He was also president of the council of the colony, and rector at Williamsburg. He published many of his sermons and discourses.

BLAIR, MONTGOMERY, b. Kentucky, 1813; son of Francis P., sr.; educated at West Point, and served in the Florida Indian war, but resigned from the army and began the practice of law in St. Louis, where he was U. S. district attorney, and (1843–49) judge of common pleas. He went to Maryland in 1852, and became solicitor in the federal court of claims. In 1857, he was counsel for the plaintiff in the Dred Scott case; the next year president Buchanan removed him from his office of solicitor. In 1861, he was postmaster-general in Lincoln's first cabinet; but went out in 1864, and has since adhered to the democratic party.

BLAIR, or PORT BLAIR, the chief British convict settlement in the Andaman islands Indian ocean), on the s.e. shore of s. Andaman, 11° 42′ n. and 93° e.; settled as a convict depot in 1789. It has one of the best harbors in Asia, and from its position in the bay of Bengal, is a most important naval and military station.

BLAIR, ROBERT, author of *The Grave*, was b. at Edinburgh, where his father was a clergyman, in 1699. After completing his education for the church, and traveling on the continent, he received license, and in 1731 was ordained minister of Athelstaneford, Haddingtonshire, where he lived in easy circumstances till his death, in 1746. He was an accomplished and thoughtful man, devoted considerable attention to natural science, particularly botany, and corresponded on friendly terms with several eminent contemporaries, among others, Watts and Doddridge. To them he submitted the MS. of his poem, which he had written before his ordination. Watts offered it to two publishers, who thought it too heavy for the times, and it remained several years unprinted. It afterwards attained an honorable place in the esteem of those capable of appreciating a masculine, though somewhat gloomy force of thought and imagery, applied to a profoundly suggestive and serious theme. It found a congenial illustrator in William Blake (q.v.) B. was succeeded in his ministerial charge by the author of *Douglas*. His son, Robert Blair, of Avontoun, became lord president of the court of session.

BLAIR-A'THOL, a village in the county of Perth, Scotland, situated at the confluence of the Tilt and Garry, about 30 m. n.n.w. of the city of Perth. Blair castle, the seat of the duke of Athol, is situated here. The larch-trees surrounding it are remarkable alike for their enormous size, and for the fact of their being among the first planted in Scotland.

BLAIR-GOW'RIE, a village in Perthshire, very picturesquely situated on the e. side of a range of hills, on the right bank of the Ericht, 16 m. n.n.e of Perth. It consists chiefly of one winding street. Pop. in '71, 4832. It has flax-spinning and weaving factories, driven by the Ericht. Pure white marble is found in the vicinity. There is a branch railway from Cupar-Angus.

BLAIRSVILLE, a t. in Indiana co., Penn., 53 m. e. of Pittsburgh; on the Pennsylvania railroad, and the Pennsylvania canal; pop. '70, 1054. It is an important point for shipping country produce by canal and rail.

BLAKE, GEORGE SMITH, 1803–71; b. Massachusetts; commodore in the U. S. navy. He was a midshipman in 1818; lieut. in 1827; commander in 1847; fleet capt. and commander in the Mediterranean three years; capt. in 1855; superintendent of the naval academy during the civil war; and afterwards commodore and inspector of lighthouses.

BLAKE, JOHN LAURIS, D.D., 1788–1857; b. New Hampshire; graduate of Brown university; licensed by the Rhode Island association as a Congregational minister, but early

united with the Episcopal church. He established a seminary for young ladies in Concord, which was removed to Boston in 1822, where he had charge of St. Matthew's church. He edited the *Literary Advertiser* and the *Gospel Advocate*, and published the *Text-Book of Geography and Chronology, Biographical Dictionary, Family Cyclopædia, Letters on Confirmation*, and a number of text-books for schools.

BLAKE, ROBERT, a celebrated English admiral, who, more than any other, contributed to render England mistress of the sea, was b. at Bridgewater, in Somersetshire, where his father was a merchant, in 1598. An ardent republican, and a man of blunt, straightforward manners, singularly devoid of fear, and of inflexible character, he was much respected by Cromwell, with whom, however, he had no very intimate intercourse. When the civil war broke out, he raised a troop in Somersetshire, and took part in all important actions fought against the royalists in the western counties. In 1644, he surprised Taunton, of which place he was made governor, and in that capacity gave proof of no mean military skill. In 1649, in conjunction with two other officers of equal rank, he was appointed general of the sea, the two services at that time not being distinct, as they are now. This was B.'s true sphere, and in it he soon exhibited transcendent ability. After destroying, with the exception of two vessels, the squadron of prince Rupert, which had sought safety in the Tagus in 1651, B. forced the royalists to surrender Guernsey, Jersey, and the Scilly isles. In Mar., 1652, he was made sole admiral of the fleet for nine months, and during this year he fought four engagements with Dutch fleets under Tromp, Ruyter, and De Witt. In the first, on the 19th May, the Dutch retreated under cover of darkness, with the loss of one man-of-war captured, and another sunk. In the next engagement, a squadron of 12 ships, sent to protect the herring-vessels from the attacks of B., were captured; and in the third, on the 28th Sept., 3 Dutch vessels were destroyed, and the rear-admiral taken. On the 29th Nov., a fleet of 80 vessels, under the command of Van Tromp, encountered B. with only 40 off the Goodwin sands. The courageous Englishman scorned to fly even from odds so overwhelming, and the result of the action was the loss of 6 of his ships—2 captured, and 4 destroyed; the rest, in a shattered condition, sought safety in the Thames. Van Tromp now had recourse to that foolish act of bravado with which his name is associated: he tied a broom to the mast-head of his vessel, and sailed through the channel, thus intimating that he had swept English vessels clean out of it. Tromp little knew the indomitable character of B., or of the nation of which he was the worthy representative on the seas. By Feb., 1653, B. was at sea again with 80 ships, and falling in with Van Tromp with about an equal force, he at once attacked him, and after a three days' running-fight, the Dutchman was fain to seek shelter in the shallow waters of Calais—where the greater draught of the English ships did not admit of their following—with a loss of 11 men-of-war, and 30 of a fleet of merchantmen he had in convoy. The English lost only one ship. On the 3d and 4th of June, B. and his coadjutors, Deane and Monk, won another victory over Van Tromp; but ill-health prevented B. from taking part in the engagement of the 29th July, which finally shattered the naval supremacy of Holland. In 1654, B. was appointed by Cromwell to command an English fleet in the Mediterranean, where he soon made the British flag respected by Dutch, Spanish, and French alike. The dey of Tunis refused to do it reverence. B. attacked his capital, burned the Turkish fleet of nine ships which lay before it, accomplished a landing, and with a body of about 1000 men, annihilated an army of 3000 Turks. He next sailed to Algiers and Tripoli, landed, and set free all the English who were detained as slaves. He concluded alliances highly favorable to England with Venice and Tuscany. In 1657, he defeated the Spaniards at Santa Cruz. This was perhaps one of the most daring actions in B.'s memorable career. With a wind blowing right into the bay—which was very strongly defended—B. dashed in, attacked and destroyed the Spanish galleons and shipping in the harbor, and, the wind fortunately changing, sailed out again with a loss of only one ship and 200 men. The Spanish loss in men and property was immense, and the terror the action inspired insured increased respect to the English flag. His health now failed; he returned to England, and died, as his ship entered the harbor of Plymouth, in the year 1657. Cromwell honored his memory by a solemn funeral procession, and caused him to be interred in Westminster abbey. His skill and courage were equaled only by his disinterested patriotism, sterling honesty, and love of justice; he not only gained a decided superiority over England's mightiest naval opponent, but, by the bold tactics he introduced, infused that spirit of enterprise which has ever since distinguished the British navy.

BLAKE, WILLIAM, a celebrated engraver and poet, was b. in London, 1757. In 1789, he published *Songs of Innocence and of Experience, showing the Two Contrary States of the Human Soul*, with about 60 etchings, remarkable for their peculiar and original manner. The poems were equally singular, but many of them exhibited true pathos. Some marginal designs for Young's *Night Thoughts*, executed by B., were greatly admired by Flaxman. B. lived in the full belief that he held converse with the spirits of the departed great—among others, with those of Moses, Homer, Virgil, Dante, and Milton. He published numerous etchings, chiefly of religious and cognate subjects, among the best of which are his *Illustrations of the Book of Job*, and the illustrations of Blair's *Grave*. He died (Aug. 12, 1828) in poverty and obscurity, with the conviction

that he was a martyr to poetic art. Charles Lamb regarded him as "one of the most extraordinary persons of the age;" and A. C. Swinburne said of him that he was "the single Englishman of supreme and simple poetic genius of his time." See *Life of B.*, by Alex. Gilchrist (1863); *William B.*, by Swinburne (1868); and *Poetical Works*, edited by W. M. Rossetti (1874).

BLAKE, WILLIAM PHIPPS, b. New York, 1826; graduate of the Sheffield scientific school; geologist of the Pacific railroad exploring expedition of 1853, and author of a portion of the reports; edited the *Mining Magazine;* in 1861–63 mining engineer for Japan; in the latter year appointed professor of mineralogy, etc., in the college of California, and geologist to the state board of agriculture. He was commissioner for that state in the Paris exposition; executive commissioner for Connecticut in the centennial exposition, and special agent to Vienna in 1873. He has published *Silver Ores and Silver Mines, Report on the Production of Precious Metals, Mining Machinery*, etc.

BLAKELY, JOHNSTON, 1781–1814; b. Ireland. He was educated at the university of North Carolina, and went into the American navy in 1890. In 1813, he was commander of the *Wasp*, a new sloop of war. In his first cruise he captured the English sloop *Reindeer*, taking his prize into L'Orient. On another cruise he made several prizes, and captured the *Avon* and the *Atalanta*. The *Wasp* was spoken Oct. 9, 1814, but was never afterwards heard from.

BLAKEY, ROBERT, b. England, 1795; metaphysician and author. He has published *The Freedom of the Divine and Human Wills, History of Moral Science, History of the Philosophy of the Mind, Historical Sketch of Logic, History of Political Literature*, and some works on religious topics, and sporting. In 1835, he was appointed professor of logic and metaphysics in Queen's college, Belfast.

BLANC, LE, a t. of France, in the department of the Indre, with a beautiful situation on the Creuse, which divides the town into two parts, about 32 m. w.s.w. of Châteauroux. Above B., the river expands so as to form a lake, but at the town it contracts, and breaks into cascades with sufficient fall to turn the machinery of several manufactories. B. is a thriving place, with cloth and linen yarn mills, potteries, tanneries, vinegar-works, forges, etc. It is very ancient, having been frequented by the Romans. Pop. '76, 4724.

BLANC, LE [from *ante Supplement*], a t. of France, in the department of Indre, on the Creuse, 33 m. w.s.w. from Châteauroux. It is beautifully situated, and is a neat and well-built town. It was formerly strongly fortified, but the fortifications are dismantled. Its principal industries are the manufacture of coarse woolen cloths, and tanning. Vinegar is also made here; and there is a considerable trade in the wine of the district, and in iron, fish, wood, and pottery. There are several iron-works in the vicinity. Pop. '76, 4724.

BLANC, MONT. See MONT BLANC.

BLANC, AUGUSTE ALEXANDRE PHILIPPE CHARLES, an engraver, b. France, 1815; head of the department of fine arts in the ministry of the interior, 1848–52. In 1845, he began, but has not finished, a *History of French Painters of the Nineteenth Century*. He has written biographies of Dutch and French painters for the *History of Painters of All Schools*. He is also author of *The Complete Works of Rembrandt, Grammar of the Arts of Design*, and other works, and is editor of the *Gazette des Beaux Arts*.

BLANC, JEAN JOSEPH LOUIS, a celebrated French socialist and historian, was b. at Madrid, 28th Oct., 1813. In 1820, he was placed in the college at Rhodez; in 1830, he went to Paris, and became a clerk in an attorney's office for a short time; but in 1832 he was intrusted with the education of the son of M. Hallette, mechanist of Arras. Here he resided for two years, contributing largely, on literary and political subjects, to the *Progrès du Pas-de-Calais*. He afterwards went to Paris, where he contributed to various political papers, and where in 1838 he founded the *Revue du Progrès Politique, Social et Littéraire*, in which he laid down in a more quiet and leisurely way his socialistic theory. In this he brought out his chief work on socialism, the *Organisation du Travail*, which, in 1840, appeared in a separate form. The book obtained for its author a wide, enthusiastic popularity among the French *ouvriers*, who were captivated by the brilliancy of the writing, the symmetrical simplicity of the scheme, and the freshness of the views advocated. The book denounces the doctrine of individualism—i.e., individual and competitive efforts in labor—and advocates the absorption of the individual in a vast "solidarity," where "each would receive according to his needs, and contribute according to his abilities." B. next published (in 1841–44) a historical work, entitled *Révolution Française: Histoire de Dix Ans*, 1830–40, which produced a deadly effect on the Orleans dynasty. Louis Philippe afterwards declared that "it acted like a battering-ram against the bulwarks of loyalty in France." It owed its success partly to the exposure it gave of the scandalous jobbery and immorality of the crown and its advisers, partly to that passionate ardor which changed the tranquillity of history into the vehemence of a pamphlet, and partly to its academic pomp of style. This was followed by the first volume of a *Histoire de la Révolution Française*, in which the author's aim was not only to describe, from his own point of view, the incidents of the first revolution, but the social history of the 18th century. On the breaking out of the Feb. revolution of 1848,

B. seemed likely to play an important part. His connection with the party of the *Réforme* journal, and his popularity with the working classes, led to his being appointed a member of the provisional government. He was placed by government at the head of the great commission for discussing the problem of labor. At the same time, Marie, minister of public works, began—but without B.'s co-operation—to establish the so-called national workshops, which were to bring about the realization of the socialistic principle, but which only proved the hazardous and impracticable character of B.'s doctrines. The national workshops led to the arrest of the 15th May, 1848, when B. nominally, if not actually, again played a prominent part. A proposal was made to prosecute him, but it was negatived by the national assembly. After the June insurrection, he was again accused, and prosecuted for conspiracy, but contrived to escape to London, where he spent many years. During his exile, he devoted himself to political and historical literature. In 1849 appeared his *Appel aux Honnêtes Gens*, and *Catéchisme des Socialistes;* in 1850, *Pages d'Histoire de la Révolution de Février;* and in 1851, *Plus de Girondins; la République Une et Indivisible.* The work which has secured him the most enduring reputation is his *History of the French Revolution*, written during his residence in England. It is characterized by extensive and original research, which has frequently enabled the author to reverse the common verdicts on historical personages, and to explode many of the extravagant stories of the stormy period of which it treats. In style, it is eloquent, bold, and dignified; and if its sentiments do not always commend themselves to the sober judgment of English readers, there can be but one opinion in regard to its candor, impartiality, and power. It consists of 12 volumes. On the fall of the empire in 1870, B. returned to France, and in 1871 he was returned to the national assembly. B. has a great command of the English language.

BLANCH, or BLENCH HOLDING is one of the ancient feudal tenures in the law of Scotland relating to land, the duty payable to the superior or lord being in general a trifling sum, as a penny Scots, or merely illusory, as a peppercorn, "if asked only," although it may happen that the duty is of greater value. Anciently, many estates in Scotland were held, both of the crown and other superiors, by this tenure, but it is now seldom adopted in the constitution of an original right of property. See CHARTER, TENURE.

BLANCHARD, FRANÇOIS, 1738–1809; a French aeronaut who made many attempts to build a flying-machine. In 1784, he tried a balloon with wings or sails, and a rudder. The next year he crossed the English channel by balloon, and the same year invented the parachute. He came to the United States in 1796, and gave many balloon exhibitions. Two years later, at Rouen, he took up 16 persons with a single balloon, and landed them safely 15 m. away. At the Hague, making his 66th ascent, he was struck with apoplexy, from which he never recovered. His widow made an ascent at Paris in 1819, when her balloon took fire.

BLANCHARD, EDWARD LEMAN, b. England, 1820; about 1845 he was editor of *Chambers's London Journal*, and compiler of various guides and hand-books. He wrote a number of stories, essays, farces, burlesques, and dramas; edited Willoughby's *Shakespeare*, wrote the *Man Without a Destiny*, etc., and for nearly 30 years has furnished the Christmas plays for Drury lane theater. He has been more than 15 years one of the editors of the *Daily Telegraph*.

BLANCHARD, THOMAS, 1788–1864; b. Mass.; mechanic and inventor. Among his inventions were a machine for making tacks, one for turning gun-barrels, a lathe for turning gun-stocks and other irregular shapes; a steam wagon, before locomotives were used; contrivances to aid steamboats in ascending rapids, and a machine for bending large timber. He received in all more than 25 patents for important inventions.

BLANCHE-LYON, the title of one of the English pursuivants-at-arms. See PURSUIVANT.

BLANCHE OF CASTILE, 1187–1252; daughter of Alphonso IX. and Eleanora of England (daughter of Henry II.); married, according to treaty, to Louis, heir-apparent to the crown of France. After the death of Richard the lion-hearted, the nobles opposed to John offered the English crown to Louis, and his wife urged its acceptance; but the death of John ended the conspiracy. Blanche was the main reliance of Louis when he became king, and after his death she was regent during the minority of her son, Louis IX., during which time she defeated a powerful conspiracy to put a son of Philip Augustus on the throne. She acquired Toulouse by treaty, compelled the submission of the duke of Brittany, and aided the count of Champagne in securing the kingdom of Navarre. She had remarkable executive talent, and personally supervised all government departments, not excepting the army. When her son was 19 years or age, she married him to Marguerite of Provence, who was only 12; and when she yielded up her powers in 1236, France was in a most flourishing condition. She again ruled as regent while Louis was gone, against her strong protest, to the crusade. Louis required great sums of money, and when finally he was a prisoner in Egypt further large sums were demanded for his release. The common people of France rebelled against the necessary taxation, but she put them down with a strong hand; and in spite of all these embarrassments she firmly resisted the encroachments attempted by the church. France

has seldom had so able and excellent a ruler, or lost one whose death was more universally lamented.

BLANCHING is a process resorted to by gardeners, to prevent certain secretions which in ordinary circumstances take place in the leaves of plants, and to render them more pleasant and wholesome for food. The action of light is indispensable to the decomposition of carbonic acid by the leaves of plants, and, consequently, to the elaboration of many of the substances from which they derive their peculiar qualities; the exclusion of light, therefore, renders them white, or nearly so, and deprives them of much of their natural coarseness and bitterness—as in the familiar examples of lettuce, celery, sea-kale, etc. B. is accomplished in various ways, as by drawing up earth to the plants, when the lower part of the leaf or leaf-stalk alone is to be blanched; tying the whole leaves together, by which the inner ones are blanched in a somewhat imperfect way, as is commonly done with lettuce; covering with boxes, pots, or the like, as the practice is with sea-kale; causing the leaves to grow up through litter, etc. The figure represents a very convenient B.-pot, of French invention; it is made of earthenware, and perforated with many holes. B., although so simple and easy, is of great importance in the art of gardening, and the usefulness of many plants very much depends upon it. In cabbage, and some other cultivated plants whose leaves form themselves into compact heads, there is a natural B. or etiolation.

BLANC-MANGE', so called from its white appearance, is a jelly made of isinglass and milk. The following is the ordinary recipe for making it. Take a quart of sweet milk or cream, and put in it two ounces of the best isinglass, with the rind of a lemon, a blade of mace, and white sugar to taste. Put the whole in a saucepan, and let it boil a quarter of an hour; then mix with 6 bitter almonds and 24 sweet ones, beaten into a paste with a little water; strain through a piece of muslin; and having let the composition settle a little, pour into a mold, and turn it out when cold. Soyer gives one ounce of isinglass to a quart of milk, a quarter of a pound of sugar, a quarter of an ounce of cinnamon, a little grated nutmeg, half of the peel of a lemon, and a bay-leaf, prepared as above. B. is also made of calf's-foot jelly and eggs, of arrow-root and milk, etc.; and the flavor is modified to taste.

BLANCO, a co. in central Texas; on Perdinalis river; 727 sq.m.; pop. '70, 1187—44 colored; in '80, 3550; an agricultural region, chiefly prairie. Co. seat, Blanco.

BLANCO, CAPE, a remarkable headland on the w. coast of Africa, in lat. 20° 47′ n., and long. 16° 58′ w., the extremity of a rocky ridge (called Jebel-El-Bied, or White mountain) which projects from the Sahara in a westerly direction, and then bending southward, forms a commodious harbor called the Great bay. The bay and town of Arguin, which is supposed to have been the limit of ancient navigation in this direction, lies some miles to the southward. Southward to the mouth of the Rio Grande the shores are of a low sandy character, with a current tending s.w., and prevalent n.e. trade-wind; northward from cape B. to cape Geer, the coast is rocky, with a moderate elevation. On account of the deficiency of good harbors, the prevalence of w. winds, and other causes, the casualties to shipping are very numerous. The constancy of w. wind on a coast almost wholly within the sphere of the trade-winds, is very remarkable, and is accounted for by the rarefaction of the air by the heat of the sands of the Sahara. The natives of the Canary islands carry on a pretty lucrative fishery in the bay in boats of from 100 to 150 tons burden. Cape B., which is composed of mixed calcareous and silicious sandstone, was first discovered by the Portuguese in 1441.—Cape B. is also the name of several less important headlands in Spain, Greece, America, and the Philippines.

BLAND, a co. in s.w. Virginia; 330 sq.m.; pop. '70, 4000—217 colored. Productions agricultural; co. seat, Mechanicsburg.

BLAND, a beverage which is—or formerly was—a common drink among the inhabitants of the Shetland islands during the summer months. It is prepared from the whey or serum of churned milk, and is said to be an agreeable beverage. Dr. Edmondston, in his *View of the Zetland Islands*, describes B. as being, when twelve months old, perfectly good and transparent; its flavor then bearing a strong resemblance to lemon-juice.

BLAND, THEODORIC, 1742–90; an American patriot, descendant of Pocahontas; educated in medicine in Edinburgh; practiced in Virginia, and espoused the cause of the colonies. He was lieut.col. of Virginia cavalry, and served through the war, being an intimate friend and confidant of Washington. He was a member of congress under the federal constitution. He left the "Bland Papers," in which are many valuable facts concerning the struggle for liberty.

BLANDFORD, a t. in Hampden co., Mass.; pop. '80, 979. It has manufactories and a good public library; its picturesque scenery and elevated situation, about 2000 ft. above the sea, make it a favorite summer resort.

BLAND'FORD-FO'RUM, or MARKET BLANDFORD, a t. in Dorsetshire, on the right bank of the Stour, 16 m. n.e. of Dorchester. It lies in a fine tract of pasture-land, famed for its multitude of cows. It suffered much in 1579, 1677, 1713, and 1731, from

fire. It is built of brick, and is neat and regular. It was formerly famed for its manufactures of bandstrings and lace, the point-lace bringing £30 a yard. Shirt-buttons are made here. Pop. in 1871, 4011.

BLANDRATA, GIORGIO, the founder of Unitarianism in Poland and Transylvania, was a native of Saluzzo, in Italy. He had established himself as a physician at Pavia, when he was compelled, on account of his heretical opinions, to fly to Geneva in 1556, where at first, and to avoid further molestation, he feigned to agree with Calvin. In 1558, he went to Poland, hoping to find there greater freedom of thought and speech; and in 1563 he betook himself to the court of John Sigismund, prince of Transylvania, whose favorite physician he became. Here he exerted himself prudently but assiduously to spread his doctrines, and succeeded in forming a considerable party. In his old age, however, the heat of his proselytizing zeal died out; and it is asserted that, to preserve his worldly interests, he even forsook the cause of the Unitarians, and favored that of the Jesuits, who were in high esteem with the prince. He was murdered in 1590 by his nephew, whom he had threatened to disinherit on account of his attachment to the Catholic church. B.'s religious treatises are entirely destitute of importance.

BLANE, Sir GILBERT, a distinguished physician, was b. at Blanefield, Ayrshire, Aug. 29, 1749. He studied at Edinburgh university, and afterwards became private physician to lord Rodney, whom in that capacity he accompanied in 1780, when Rodney assumed the command of the West Indian squadron. On one occasion, when all the officers were wounded, B.'s bravery was so conspicuous, that lord Rodney immediately obtained for him the appointment of physician to the fleet. In 1785, he was elected physician to St. Thomas's hospital, London, having previously been appointed physician-extraordinary to the prince of Wales. In 1795, he was chosen head of the navy medical board, and was greatly instrumental in introducing the use of lemon-juice, so effective in preventing scurvy, into every vessel in the navy; and in many other ways he was active in promoting measures for the prevention or remedy of diseases on board ship. In 1809, he was employed to report on the cause of the unhealthiness of the Walcheren army, and the following year he was sent to inquire into the expediency of establishing a naval arsenal and dockyard at Northfleet. In 1812, he had a baronetcy conferred upon him, and in the same year the prince regent made him his physician in ordinary. When the duke of Clarence ascended the throne as William IV. in 1830, he made B., then 81 years old, his first physician. B. died June 26th, 1834. He published several valuable works, characterized by varied knowledge and originality of thought, the most popular and useful of which are, *Observations on the Diseases of Seamen*, a lecture on *Muscular Motion*, and *Elements of Medical Logic*.

BLANÉS, a t. of Spain, in the province of Gerona, and 22 m. s. of the city of that name, with a port on the Mediterranean. Pop. 5000.

BLANK BONDS were Scotch securities, in which the creditor's name was left blank, and which passed by mere delivery, the bearer or holder being at liberty to insert his name in the blank space, and sue for payment. The intention originally was to save the expense of conveyances, and to facilitate the transmission of the obligation; but experience having proved that they were capable of being used for fraudulent purposes, these bonds were, by a Scottish act, passed in 1696, declared void. The act, however, excepts from its provisions the notes of trading companies, and indorsements of bills of exchange. See BOND, SECURITY.

BLANK CARTRIDGES. The distinction between *blank* and *ball* cartridges will be found noticed under CARTRIDGE.

BLANKENBURG, a t. in the duchy of Brunswick, 37 m. s.s.e. of the capital, is situated on the borders of the Harz mountains, at an elevation of 732 ft. above the sea. It has a gymnasium, and several charitable and educational institutions. Pop. '75, 4519, chiefly engaged in mining; iron, marble, and dye-earths being plentiful in the surrounding districts. On the Blankenstein, a rocky height immediately adjoining the town, there is a palace belonging to the duke of Brunswick; and on the lofty summit of the Regenstein, about half a mile distant, there are the remains of a large castle, with many chambers, hewn out of the rock by Henry the fowler in 919. Louis XVIII. resided at B. as comte de Lille, 1796–98.

BLANK VERSE is verse without rhyme (q.v.), and depending upon meter (q.v.) alone. The classical productions of the Greek and Roman poets—at least such of them as have come down to us—are composed on this principle; and, accordingly, when the passion for imitating classical models set in, rhyme came to be looked upon as an invention of Gothic barbarism, and attempts were made in most countries to shake it off. The first specimen of blank verse in English is a translation of the second and fourth books of Virgil's *Æneid*, by the earl of Surrey, who was executed in 1547; but it had been used by Italian and Spanish writers as early as about the beginning of that century. In England, its adaptation to the drama was at once felt, and in that department of poetry it soon became and has continued dominant—if we except the effort made by Dryden and others, after the restoration, to return to rhymed plays; but in other kinds of poetry, it was not till the appearance of *Paradise Lost* (1667) that it could be said to have taken root; and even then the want of rhymes was felt.

as the poet expected it would. Many poets have since followed Milton's example; and English narrative, didactic, and descriptive poetry is partly in B. V., partly in rhymed couplets. It is chiefly in "heroic" meter, as it is called—that is, in verses or lines of ten syllables—that blank verse has found a firm footing. Some, in fact, would restrict the name B. V. to lines of ten syllables, not considering it applicable to such meters as those of Southey's *Thalaba* and Longfellow's *Hiawatha*.—Dramatic B. V. is characterized by the frequent occurrence of a supernumerary syllable at the end of the line:

To be | or not | to be, | that is | the ques|*tion:*
Whether | 'tis no|bler in | the mind | to suf|*fer.*

In Italian and Spanish, B. V. never became popular, and still less in French. The German language seems to admit every variety of blank meter.

BLANQUI, JÉRÔME ADOLPHE, one of the first French economists, was b. at Nice, 28th Nov., 1798, and educated at the lyceum of that city. In 1814, his family quitted Nice, and young B. went to complete his studies at Paris, where he became acquainted with J. B. Say, who induced him to turn his attention to the study of political economy. In 1825, by Say's recommendation, he was appointed professor of history and of industrial economy in the commercial school at Paris. On the death of Say, he was appointed professor of industrial economy in the conservatoire des arts et métiers, and was one of the editors of the *Dictionnaire de l'Industrie Manufacturière, Commerciale, et Agricole.* In June, 1838, he became a member of the academy of moral and political science. The academy sent him to Corsica, to study the condition of that country, and in 1839, to Algiers for the same purpose. In 1841, he visited Turkey. In 1851, the academy, which highly valued his abilities, requested him to furnish a complete account of London in its financial and other aspects. This task he executed to the satisfaction of the *savans* who employed him. He died at Paris on the 28th Jan., 1854. B. as a national economist, was somewhat inclined to socialism. Like his master, Say, he was in favor of free-trade. In method, he is ingenious; in style, transparent; and even the dryest discussions become interesting, from his lively mode of treating them. His principal works are—*Voyage d'un Jeune Français en Angleterre et en Ecosse* (Paris, 1824); *Résumé de l'Histoire du Commerce et de l'Industrie* (Paris, 1826); *Précis Elémentaire d'Economie Politique, précédé d'une Introduction Historique, et suivi d'une Biographie des Economistes,* etc. (Paris, 1826); and, most important of all, the *Histoire de l'Economie Politique en Europe, depuis les Anciens jusqu'à nos jours, suivie d'une Bibliographie raisonnée des Principaux Ouvrages d'Economie Politique.*

BLANQUI, LOUIS AUGUSTE, the brother of the economist, was b. at Nice in 1805. He has made himself conspicuous chiefly by his rabid advocacy of the most extreme political opinions. From an early age, he dabbled in conspiracy, and submitted to its penalties with the pride of a martyr. After the revolution of Feb., he formed the central republican society, which menaced the very existence of the provisional government. He it was also who organized the revolutionary *attentat* of the 15th May, the aim of which was to overthrow the constituent assembly. At the head of an excited mass, he made his appearance before the national representatives, and with that melodramatic love of liberty which makes a French patriot fancy it to be his first and most sacred function to emancipate the world, demanded the *resuscitation of the Polish nationality!* His coadjutor, M. Huber, went a step further, and pronounced the dissolution of the assembly. The latter fortunately proved itself strong enough to crush this insolence. B. was arrested, and condemned to 10 years' imprisonment in Belleisle. In 1861, he was sentenced to other 4 years' imprisonment. He appeared again as one of the most active spirits in the red republican movement of 1870–71, and once more became a prisoner of state.

BLAPS, a genus of insects, of the order *coleoptera*, the type of a tribe called *blapsides*, the species of which are numerous, all of a dark color, destitute of wings, and having the elytra or wing-cases united together. They run slowly, however, in comparison with many kinds of beetles, and inhabit dark and damp situations, feeding chiefly on dead vegetable matter. They have the power of secreting and emitting a brownish, acrid, irritating fluid, of a peculiar and penetrating odor, with which they appear to be furnished for the purpose of self-defense, and which some of them are capable of throwing to a distance of 6 or 8 inches. *Blaps mortisaga* is a common British species, of about 1 in. long, and of a shining black color. It is sometimes called DARKLING BEETLE, and CHURCHYARD BEETLE, sometimes seems to share with the cockroach (q.v.) the appellation of BLACK BEETLE. It is a frequent companion of the cockroach in pantries and cellars.—*Blaps sulcata* is cooked with butter, and eaten by Turkish women in Egypt, under the notion that it will make them fat, this being, in their estimation, one of the chief points of beauty.

BLARNEY, a village in Ireland, 4 m. from Cork, having a castle built in 1449 by Cormac McCarty. Near the castle are the "groves of Blarney," and on the summit of the castle tower is the stone, the kissing of which is said to endow one with the gift of coaxing, wheedling, and flattering. The true stone is said to be one in a wall where it can be kissed only by a person held over the parapet. The name has given a noun, a verb, and a participle to the English language.

BLASIUS, a saint and martyr, was bishop of Sebaste, in Cappadocia, when Licinius began a bloody persecution of the Christians. B. left the town, and concealed himself in an unknown chasm in the rocks, but his abode was discovered by Agricola, while out hunting. The saint was conveyed to Sebaste, and as he steadfastly refused to deny Christ, and worship the heathen gods, he was put to death (316 A.D.) with circumstances of the most horrid cruelty. At one period, his worship must have been widely diffused, judging from the extent of territory over which his relics were scattered. The woolcombers claim him as their patron, for the singular reason that he was tortured, among other instruments, with a wool-comb. At Bradford, in Yorkshire, there is a septennial procession of that craft on his day. The practice of invoking St. B. in cases of sore throats, is said to have originated in the circumstance that, when young, he saved the only son of a rich widow from being choked by a fish-bone. It has been conjectured, however, that the wool-comb has probably been mistaken for a fish-bone, and that the story of the rich widow's only son is simply a myth elaborated in explanation of the circumstance. St. B.'s day is the 3d February.

BLASPHEMY is an offense against God and religion, by denying to the Almighty his being and providence; or by contumelious reproaches of our Lord and Savior Jesus Christ; also all profane scoffing at the Holy Scriptures, or exposing them to ridicule and contempt. Seditious words, moreover, in derogation of the established religion may be proved under a charge of blasphemy. These all are offenses punishable at common law by fine and imprisonment, or other infamous corporal punishment; for Christianity is held to be part of the laws of England; and a blasphemous libel may be prosecuted as an offense at common law, and punished with fine and imprisonment. In Gathercole's case, tried at York, in 1838, where the defendant, a clergyman of the church of England, was prosecuted for a libel on a Roman Catholic nunnery, and in which he also made a violent attack on the tenets and the morality of the Roman Catholic church, it was laid down by the judge who tried the case (the late baron Alderson), that a person may, without being liable to prosecution for it, attack Judaism, or Mahommedanism, or even any sect of the Christian religion, save the established religion of the country; and the only reason why the latter is in a different situation from the others is because it is *the form established by law*, and is therefore a part of the constitution of the country. But any general attack on *Christianity* is also the subject of criminal prosecution, because Christianity is the public religion of the country. Thus, as an offense against religion, B. may assume one of two forms: first, either as against the articles and creeds of the established church; or secondly, as against a dissenting community, in the libel against whom, a general attack on the Christian religion is involved. The B. must in some manner have been overtly and publicly declared, either by a speech on some public occasion, or by the act of publication in print.

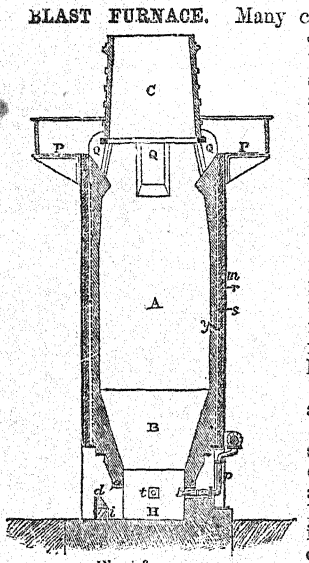
The Scotch law regarding this offense is now very much the same. The old severe Scotch acts, one passed in 1661, and another in 1695, which provided capital punishment for offenses of this description, were repealed by the 53 Geo. III. c. 160. The punishment is now arbitrary at common law; and by the 6 Geo. IV. c. 47, the punishment of B. is further restricted, and made the same as in England. It is also enacted by the second section of that act, that a person convicted of a second offense may be adjudged, at the discretion of the court, either to suffer the punishment of fine or imprisonment, or both, or to be *banished* the country; but the provision as to the punishment of banishment is repealed by the 7 Will. IV. c. 5. The latest and most remarkable illustration of the Scotch law regarding this offense, is a case that was tried before the high court of justiciary in 1843. The prisoner, who defended himself, was accused, convicted, and sentenced to imprisonment for fifteen months, for publishing profane, impious, and blasphemous books, containing a denial of the truth and authority of the Holy Scriptures and of the Christian religion, and devised, contrived, and intended to ridicule and bring into contempt the same. In the course of the trial, the prisoner endeavored to justify his conduct by quotations from the Bible, which, he maintained, warranted the language of the blasphemous works in question. But the court would not allow such a line of defense, and the lord justice-clerk (the late right honorable John Hope), in charging the jury, pointed out that the indictment charged that the wicked and felonious publication of such works *is* a crime, and that therefore the jury were not to consider themselves engaged in any theological discussion, but simply in trying whether a known and recognized offense against the law had been committed. His lordship proceeded further to expound the law as follows: "Now, the law of Scotland, apart from all questions of church establishment or church government, has declared that the Holy Scriptures are of supreme authority. It gives every man the right of regulating his faith or not by the standard of the Holy Scriptures, and gives full scope to private judgment, regarding the doctrines contained therein; but it expressly provides that all 'blasphemies shall be suppressed,' and that they who publish opinions 'contrary to the known principles of Christianity,' may be lawfully called to account, and proceeded against by the civil magistrate. This law does not impose upon individuals any obligations as to their belief. It leaves free and independent the right of private belief, but it carefully protects that which was established as part of the law, from being brought into contempt." The learned judge also observed: "I think it also my duty to add—as a part of the [prison-

er's] address was directed against the policy and expediency of this prosecution—that I think it was a most proper and fit prosecution. I have no doubt of the effect that will result from this prosecution; because, though, in his advertisement and address, this individual declares that he addresses himself chiefly to the working-classes of Scotland, yet I am sure that he deceives himself if he imagines that that is a class which would easily part with their belief in those truths, which are perhaps more valuable to them in this life than to any other class in the community. There may, indeed, be a class of persons, like the prisoner at the bar, in situations above that of the working-classes, young men whose education is imperfect, and their reading misdirected; and it is to save them from the mischief of these opinions that it is necessary the law should take its course. See RELIGION, OFFENSES AGAINST.

BLASPHEMY (see *ante*). In the United States, besides the common law, there are many statutes defining B.; but they all hold it to consist in words regarding the Deity only. It is defined as purposely using words concerning God calculated and designed to impair and destroy the reverence, respect, and confidence due him, as the creator, governor, and judge of the world; it is a willful and malicious attempt to lessen reverence for God by denying his existence or attributes, and to prevent men from having confidence in him. Blasphemy is a misdemeanor at common law, for which special punishments are assigned in various statutes; but a temperate discussion in which the existence of God is denied is not an offense. Gross profanity is blasphemy in a lesser degree, and it is punishable in most of the states, but the law is seldom enforced.

BLASTE'MA, the embryo of a seed, or the radicle and the plumule with the parts which connect them. Biologists apply the term to the rudimental mass from which tissue is formed.

BLAST FURNACE. Many costly experiments have been tried of late years in order to determine, along with other related questions, the best form of the blast furnace in which iron is smelted. Which is the most serviceable form is as yet a very much disputed point; but, according to the published accounts, furnaces of the unusual height of 80 to 100 ft. give, as a rule, the best results. There are two types of blast furnaces, irrespective of differences in their forms, as regards the way in which they are constructed. Some are built with thick walls, either entirely of brick or of brick and stone, hooped with iron, forming massive towers. Others, again, are formed of comparatively thin brick walls, and depend for their strength on an outer malleable iron casing, in which case they are called *cupola* furnaces. The furnace A., in fig. 1, article IRON, is an example of the former, and the annexed figure represents one of the latter kind.



Blast furnace

The various parts of the furnace are distinguished as follow: A. is the *shaft* or *body*, generally either in the form of a cone or cylinder, or somewhat barrel-shaped, in which case, the portion marked B is not distinguisl able from the shaft. B. is called the *boshes*, and is the part of the furnace which, from the high heat to which it is exposed, usually gives way first. H is the *hearth*, and C is the *tunnel-head*, which, however, is usually wanting when the mouth is closed by a bell and cone to save the gases generated in the furnace. P is the charging platform, and Q, Q, the openings through which the ore, fuel, etc., are fed. These materials are brought to the platform by hoists, inclines, or level gangways, according to the situation of the furnace. Just below the boshes there are four or five openings in the circumference of the *tuyeres t*, and another for the arrangements required for tapping the furnace. As respects the latter, *a* is called the tymp-arch, immediately below which is placed the *tymp* its lf, consisting of a rectangular iron box containing water in a coiled pipe. The hearth is prolonged in the direction of the *damp-plate d*, and the space between it and the tymp is filled up with sand or clay, in which there is a channel for the escape of slag. In the damp-plate is placed the *tapping-hole, i*, through which the molten iron is run off. The pipe at *p* conveys the blast, produced by a powerful blowing-engine, and heated to between 600° and 1400° F. In 1875, there were in Great Britain 993 blast-furnaces. See IRON.

BLASTING. Before gunpowder was invented, the separation of masses of stone from their native rock could only be effected by means of the hammer and wedge, or by the still slower method of fire and water. In soft and stratified rock, wedges are still used for quarrying stones for building purposes, but in hard rock, or where regularity of fracture is no object, gunpowder is universally employed. There are two kinds of B—first, the small-shot system; and second, that of large blasts or "mines."

The small-shot system consists of boring holes into the rock, of from 1 to 6 in. in diameter, and of various depths, according to circumstances. In hard rock, this is done by a steel pointed drill, struck by a hammer, and turned partly round after each blow, to make the hole cylindrical. The addition of a little water serves to preserve the temper of the boring tool, and makes the rock more easy to cut. In soft rock, when ever the hole is to be vertical, a "jumper" is used; this is a weighted drill, which acts merely by its own weight, when let fall from about a foot in height. The powdered stone is removed at intervals by a "scraper." The rate of progress varies, of course, with the hardness of the rock. At Holyhead, the average work done by three men in hard quartz rock, with 1¼ in. drills, is 14 in. in depth per hour; one man holding the drill, and two striking. After the hole is bored, it is cleaned out, and the powder poured down. A wad of dry turf or hay is put over the charge, and the rest of the hole "tamped," or filled with broken stone, clay, or sand. The shot is fired by a length of Bickford's patent fuse. When it is desirable to prevent the stones from flying about, when the shot is fired, a shield of boiler-plate, or of brushwood weighted, may be laid over the hole.

Small shots may be fired, even under water, by inclosing the charge in a tin case, with a tube of powder reaching to the surface; or in a canvas bag, well tarred, tied at the neck round a length of Bickford's fuse, which burns under water. The charge is inserted in the drill-hole; and the weight of the superincumbent water acts as tamping.

In removing the wall between the old and new Shadwell basins of the London docks, shots were fired under water within a few yards of vessels lying in the basin, by using moderate charges, and by keeping a raft of timber floating over the hole, as a shield to prevent anything flying upwards.

The voltaic battery has been used for firing shots, chiefly under water, since 1839, in which year it was employed at the wreck of the Royal George and at the Skerryvore light-house.

When a large mass of rock has to be removed at once, or where a steady supply has to be daily furnished of irregularly broken stone, for breakwater or other purposes, recourse must be had to large blasts, or "mines." The greatest isolated example of this kind of blasting was the overthrow, in 1843, of the Rounddown cliff at Dover, by 18,500 lbs. of powder, in three separate charges, fired simultaneously by voltaic electricity. But by far the grandest system of B. by mines is to be seen at the quarries for supplying stone to the breakwater at Holyhead, where small shots having been found inadequate, large mines were introduced in 1850. These large blasts are of two kinds—"shafts" sunk from the top of the rock; and "headings," or galleries driven in from the face.

The shaft-holes are 6 ft. long by 4 ft. wide, of various depths, according to the height of the rock, but seldom much exceeding 60 ft. The deal-box, with the charge of powder, is placed in a chamber cut at one side of the shaft, so that the tamping may not be in the direct upward line of fire. The tamping consists of the stone and débris which have come out of the shaft; and the wires from the battery are protected from injury by being laid in a groove cut in a batten placed up one angle of the shaft.

It is evident that the same point in the rock may be reached as well by a heading or gallery driven in from the face of the rock, as by a shaft from the top, and often by a shorter route. Headings are made 5 ft. high by 3 ft. 6 in. wide, and are driven, if possible, along a natural joint in the rock. The direction of the gallery is changed and sunk at parts, to prevent the tamping from being blown out. Four men can, on the average, drive 5 ft. run of heading per week; but cannot sink above 3 or 4 ft. of shaft, which has a greater sectional area, and is more inconvenient to work in.

The charge of powder may be divided and placed in two or more separate chambers, and it is better thus to spread a heavy charge over a length of face, than to have it in one spot, at a greater distance from the face than about 30 feet.

The charges for these mines vary from 600 lbs. to 13,000, and even more, pounds of powder; and the produce is from 2 to 6 tons of stone to the pound of powder, according to the density of the rock and the position of the mine.

Besides the quarrying of stone, B. is used for military objects, or where total destruction is aimed at, and an excess of powder is little or no objection.

Of late years great improvements have been effected in the production and application of explosive agents other than gunpowder, which latter, until lately, may be said to have been exclusively used for the purpose of blasting. Nitro-glycerine (q.v.) and gun cotton (q.v.) were discovered within two years of each other; but while gun cotton was immediately applied to industrial purposes, nitro-glycerine was destined to remain a chemical curiosity for about 16 years.

Dynamite is a preparation of nitro-glycerine and porous earth, in the form of a pasty mass, which, without materially impairing its explosive properties, has the effect of rendering it perfectly safe to handle.

One of the most celebrated applications of boring and blasting to modern engineering was the driving of the Mont Cenis tunnel. See TUNNEL.

BLASTING (*ante*). The processes of blasting are essentially the same here as in Europe; but the developments of mining, railroad building, and improvements in navigation, have rendered necessary some very extensive operations. The most impor

tant was, perhaps, the removal of the reefs in the East river, at Hallett's point, near New York, known as the "Hellgate improvement." The rock to be removed extended more than 100 yards into the river, greatly narrowing the channel and rendering navigation extremely difficult. The plan of operation was to sink a large square shaft on the Long Island shore from which the rock projected, and to run into the rock at a proper depth long galleries radiating from the place of entrance like the lines of an expanded fan. The entrance shaft was nearly 100 ft. square, and its bottom was 32 ft. below low water. Nearly 20 tunnels were bored in all directions, extending from 200 to 240 ft., and all were connected by lateral galleries. All the excavated rock was hauled to the entrance and hoisted to the surface. The work was completed in Sept., 1876, and made ready for blasting with more than 52,000 pounds of explosive material in many thousands of holes drilled for the purpose. The explosives were dynamite, rendrock, and vulcan powder. The firing was by electricity. On the given day a quarter of a million people found their way to points on land and water where the explosion could be seen. When the eventful moment arrived, gen. Newton, the engineer in charge, took the hand of his little girl, a mere infant, and with it pressed down the key by which the battery was fired. There was a rumbling or shaking of the ground, the rising of a great mass of water from 20 to 40 ft. in the air, a few small stones thrown a little higher, an immense mass of smoke, and all was over. Millions of tons of rock had been shattered, and yet the noise and the shock were less than would have attended the simultaneous discharge of half a dozen field-pieces in the open air. There was so much doubt and ignorance about the possible effect of this explosion that many people living one, two, and three miles away left their houses and took positions in the open air, through fear of wide-spread ruin. The work was completed successfully, and after dredging out the broken stone the navigation of the channel was greatly improved. In previous years much has been done in the harbor of New York by surface-blasting, i.e., lowering to the face or to some crevice of a rock cans filled with nitro-glycerine and exploding it by electricity, the effect being to gradually wear away the rock. The great work of the Sutro tunnel (q.v.) was another triumph for American engineering.

BLATTA. See COCKROACH.

BLAYE (ancient *Blavia*), a fortified seaport of France, in the department of the Gironde, 20 m. n.n.w. of Bordeaux. It is built on the right bank of the river Gironde, which at this point is about 2½ m. in breadth, at the base of a rocky eminence crowned with a strong citadel. The town is further defended by the two forts of Paté and Médoc, which command the passage of the river. The port of B. is a very busy one, all inward vessels being required to anchor and deliver the manifests of their cargoes; and many outward-bound vessels lay in their provisions here. B. has manufactures of linen and woolen, glass and earthenware; a considerable export trade in corn, wine, brandy, oil, fruits, soap, etc., and tribunals of jurisdiction and of commerce. Pop. (1876) exclusive of garrison, 3801.

BLA'ZON, BLA'ZONRY (Ger. *blasen*, to blow, as with a horn). These heraldic terms originated in the custom of blowing a trumpet to announce the arrival of a knight, or his entrance into the lists at a joust or tournament. The blast was answered by the heralds, who described aloud and explained the arms borne by the knight. B. and B. thus came to signify the art of describing, in technical terms, the objects (or charges, as they are called) borne in arms—their positions, gestures, tinctures, etc., and the manner of arranging them on the shield.

Rules of Blazoning.—As heraldry, though an entirely arbitrary, is a very accurate science, the rules of blazoning are observed on all occasions with the most rigid precision. The following are the most important: 1. In blazoning or describing a coat of arms, it is necessary to begin with the field, mentioning the lines by which it is divided —*per pale, per fess*, etc., if such there be—and noticing if they are *indented, engrailed*, or the like, it being taken for granted that they are straight, unless the contrary be mentioned. 2. There must be no unnecessary repetition in blazoning; thus, where the field is blue, and the charges yellow, we should say, *azure, a crescent between three stars, or*, thereby implying that both the crescent and the stars are *or*. 3. For the same reason, where a color has been already mentioned, and it is necessary, in order to avoid ambiguity, to repeat it in describing a subsequent charge, we say, *of the first*, or *of the second*, as the case may be. Thus, we should say, *azure, on a saltire argent, three water bougets of the first*, thus avoiding the repetition of the word azure. 4. Again, recurring to our first example, it would be an error to say, *three stars with a crescent between them*, because we must always begin with the charge which lies nearest the center of the shield. 5. Where the charges are of the natural color of the objects or animals represented, in place of describing the color, you simply say *proper*—i.e., of the proper or natural color. 6. Another general rule in blazoning, or rather in marshaling coat-armor, is, that *metal shall never be placed upon metal, nor color upon color.*

The rules for blazoning separate charges, whether animate or inanimate, are indicated in the descriptions which will be found of them under their respective heads. See ORDINARIES; also BAR, BEND, etc.

BLEACHING (Ang.-Sax. *blæcan*, from *blæc*, pale, bleak) is generally understood to mean the process of whitening or decolorizing cloth; but the term is also applied to the

decolorizing of such substances as the fixed oils, Irish moss, etc. Until about the close of the 18th c., B. depended upon the natural bleaching agencies present in the atmosphere and in the sun's rays. The usual plan was to spread out the cloth on a grass-field, called a bleaching-green, and to continue sprinkling it with water several times a day. After being thus exposed for several months to the action of air, light, and moisture, the cloth was rendered white. The process was necessarily tedious and occupied much valuable land, and for this reason a large quantity of the cloth required to be bleached was sent to Holland for that purpose. A particular kind of linen, which was regularly sent to Holland, received on that account the name of *Hollands;* and another variety of linen, which, from its fineness, was generally spread on the better grass-fields or lawns, received the title of *lawn.* An improvement in the preceding process was to dip the cloth occasionally in a weak *alkaline lye,* or solution of an alkali, such as soda in water, which step was called *bucking;* after which the cloth was spread out on the grass for some weeks, and regularly moistened with water, this stage being styled *crofting;* the cloth was then soaked in sour milk and water, which was called *souring,* and again exposed on grass to the action of air and sunlight. By repeating the bucking, crofting, and souring operations several times, the bleaching was very much hastened, and the amount of land occupied in bleaching-greens lessened. The next improvement was the introduction of dilute sulphuric acid instead of sour milk, as the souring agent; and this was so effectual, that it lessened the time required for B. from about eight months, which was the original time, to about four months.

Till very recently, it was thought that the agent in this natural mode of B. was entirely resident in the sun's rays, but the discovery of the substance called ozone (q.v.), which possesses very powerful B. properties, and which in greater or less quantity exists in the air of country districts at all times, has led to the opinion, now held by chemists, that the B. which takes place when the cloth is moistened and exposed to the air is mainly due to the ozone present therein; though the chemical rays which accompany the luminous rays of the sun may assist in the B., and also aid in the formation of the ozone. That the ozone has very much to do in open-air B., is observable from the fact that in town districts, where little or no ozone exists in the air, cloth is never bleached white.

In the year 1785, Berthollet, a distinguished French chemist, discovered the powerful B. properties of *chlorine* (q.v.), and immediately thereafter it was suggested that chlorine would be useful in the B. of cloth. At the first, the gas chlorine was employed, and being diffused in the atmosphere of a vessel or small apartment, cloth hung therein was speedily bleached. It was found, however, that the chlorine, which bleaches, or destroys color by uniting with the hydrogen of the coloring principle and thus decomposing the color, could also unite with the hydrogen of the fibre (see LIGNIN) and destroy or render tender the textile fabric. So long as chlorine was employed in the gaseous state, it was very difficult to use it of such strength as only to destroy the color, without also rotting the cloth. It was then suggested, that as chlorine was soluble in water, to the extent of two volumes of chlorine gas in one volume of cold water, the solution of chlorine might be employed. But although chlorine water was found to act efficiently and safely when the solution was of the proper strength, it was very difficult always to make it of the same strength, and more so to preserve it when made; as the least exposure to light causes more or less of the chlorine to unite with the hydrogen of the water, forming hydrochloric acid, which does not possess B. properties. After attempts to fix the chlorine in alkaline solutions, it was found that dry slaked lime was an admirable absorber of chlorine gas. The material produced from the union of chlorine with dry slaked lime is known as the *chloride of lime,* or *bleaching powder* (q.v.), and this is the substance which has continued from 1799 up to the present time to be the great artificial bleacher of cotton and linen fabrics. It is not serviceable in the destruction of the color of wool, silk, or the oils and fats; such materials being bleached by the employment of other agents, as will be afterwards noticed.

BLEACHING OF COTTON AND LINEN FABRICS.—The substances requiring to be got rid of in the purification of cotton and linen cloth are (1) the organic coloring matter natural'ly present in the fiber; (2) resinous and fatty bodies, also inherent in the fiber; (3) weavers' dressing and perspiration taken up during the process of spinning; and (4) certain saline or earthy substances. The *first stage* in the B. is the singeing of the cloth, which is accomplished by drawing the cloth rapidly over a red-hot iron cylinder, or a numerous series of gas jets, which burn off the minute particles of fiber, resembling in appearance short hairs or down, and leave the cloth perfectly smooth. The *second stage* is the washing or scouring of the cloth, which consists in rolling up the pieces of calico or linen into bundles like coils of rope, and throwing a number of pieces into a large vat among lukewarm water, and allowing them to lie till fermentation begins, and proceeds some length, when the cloth is taken out, and thoroughly washed in the dash-wheels; which are large horizontal cylinders divided into several compartments, into each of which a stream of water keeps running while the wheel is turning. The *third stage* is boiling with lime-water, or *bucking.* The apparatus employed is called the *bowking* or *bucking kier,* and consists of two compartments. The lower part is a boiler containing the lime-water, and the upper part is a capacious circular tank, into which the cloth in bundles, as it comes from the dash-wheels, is placed. By an ingenious arrangement, the

lime-water is alternately forced up, by the compression of the steam, through a pipe into the upper compartment, and falls in a shower upon the cloth, through which it percolates and sinks again through perforations into the boiler, to be again propelled into the upper compartment. Instead of using lime alone, a mixture of lime and carbonate of soda ($NaOCO_2$) is occasionally employed, which acts by forming the inert carbonate of lime or chalk ($CaOCO_2$) and caustic soda (NaO), which possesses high detergent properties. The chemical action which the boiling lye exerts on the cloth is in the formation of a soap with the resinous and fatty substances naturally inherent in the cotton or linen fiber, or communicated to it in the process of weaving, the greater portion of which is detached by the lye in the *bucking kier* and ultimately removed by a subsequent washing with water. This takes place either in the dash-wheels, or in a more effectual washing arrangement, consisting of a series of boxes or vats of different depths, placed side by side, into which the cloth is made to dip successively by passing over and under two sets of rollers. As the cloth moves on from the lower vats to the higher, it is passing from the soiled water to the more pure, as a stream of pure water is kept constantly running through the vats from the higher to the lower. The *fourth stage* in B. is the *souring* or *chemicking* in dilute sulphuric acid, of the strength of one gallon of the acid to from 25 to 30 gallons of water. The weak acid liquid is put into a large stone vat, and the goods are steeped in it. The acid acts beneficially in removing the remaining traces of the lime-soap which have adhered to the cloth, and a second washing in water, followed by bucking or scouring in soda lye, and a third washing in water are generally found necessary to obtain the cloth in the condition best suited for the subsequent operations. The *fifth stage* is *chemicking with B. liquor*, obtained by dissolving *B. powder* (q.v.) in water, and allowing the impurities or insoluble matter to subside. The B. liquor is much diluted with water, and the cloth is steeped in it for about six hours, then taken out, and allowed to soak for other six hours in a second vat containing water, after which it is drawn out and exposed to the atmosphere, when the carbonic acid of the air sets free a portion of the chlorine from the B. powder, imbibed by the cloth. The *sixth stage* is another *souring* process, during which the cloth is immersed for about four hours in a steeping vat, containing dilute sulphuric acid of the strength ranging from 1 to 8 gallons of acid in 200 gallons of water. This acid liquid, as it soaks the cloth, encounters the B. liquid which previously saturated the fiber of the cloth, and the acid combining with the lime of the B. liquid, liberates the chlorine, which attacks the remaining traces of color and removes them from the cloth.

The cloth, on being removed from the souring-vat, is boiled with soda lye, washed, and again treated with dilute sulphuric acid, which more effectually removes the decomposed coloring matter. It is thereafter thoroughly washed, passed through rollers to remove some of the water; then introduced into the *hydro-extractor*, to get rid of the water more effectually; and lastly, the cloth is dried by being suspended in the air, or by being passed over a series of heated tin rollers, called *steam cans*. In the ordinary course of B., cotton loses about one-twentieth of its weight, and linen about one-third.

After the B. operations have been successfully performed, it is customary to proceed to the *finishing* of the cloth, which consists in, firstly, passing it through a large mangle, where the crumbled piece of cloth becomes smooth; secondly, drawing the cloth over rollers, which cause it to dip in a trough containing starch; thirdly, drying the starched cloth; and, fourthly, passing it through a large mangle or calender, consisting of a series of rollers alternately of polished cast iron and solid paper, and which not only smooth out the cloth, but communicate a fine glazed surface, such as is generally exhibited in bleached cloth when purchased. The cloth intended to be printed upon or to be dyed is not starched or calendered. The operations connected with the B. of cloth by chlorine exert no injurious effect on the health of men and women engaged in them. Some of the bleach-works near Glasgow are of long standing, and give regular employment to several hundred women. The rapidity with which the B. by chlorine can be carried on, may be understood from the fact, that when pressed for time, it is no uncommon thing to bleach, finish, and return to town 1000 pieces of cloth within 48 hours. Valuable in many respects, however, as is the rapidity of B. by means of chemical agents, it must be admitted that the process exerts a certain weakening effect on the cloth, and that, after all, B. according to the old method on the grass is preferable. Grass B. is therefore still in use where time admits, as also for cleaning linen and cotton apparel in domestic washing. See Washing.

Bleaching of Wool is never accomplished by B. powder, but recourse is had to sulphurous acid, which disguises the color of the wool by combining with it to form a colorless compound. Originally the wool is contaminated with a greasy substance called the *yolk*, which naturally exudes from the skin of the sheep, and this unctuous matter mainly consists of a kind of soap soluble in water. The *first stage* in the B. of W. is to get rid of the yolk, which can be done by long-continued washing in water; but as this is tedious, the general plan is to steep the wool in a vat containing one part of stale urine and five parts of water, then boil for some time, and ultimately strain the wool and wash well. The agent in the stale urine which acts upon the yolk is carbonate of ammonia, and this acting upon the oily matters forms a soap which can be readily washed away. When woolen cloth is to be bleached, it is customary to substitute carbonate of soda (washing soda) for the stale urine, and this forms an alkaline lye, which performs the

same part as the carbonate of ammonia. Soap is sometimes used an auxiliary. The *second stage* of bleaching wool is the *sulphuring*, which takes place in a small wooden apartment, in which the damp cloth is suspended in regular folds from the roof to the floor, and a small pan of ignited sulphur being introduced, the doors, etc., are firmly closed. There are little openings round the sides of the chamber, for the admission of air, which can be closed at pleasure. The sulphur (S) in burning take up two atoms of oxygen from the air, forming sulphurous acid (SO_2), which is the bleaching agent; and in about 24 hours the operation is finished, and the woolen material only requires to be thoroughly washed with water, which may contain a little potash or soda. Where the wool is naturally high-colored, it is necessary to repeat the various stages of the process several times before the bleaching is complete. Instead of applying sulphurous acid in the gaseous form, a solution of it in water is sometimes used. An economical method of preparing the solution of sulphurous acid is to introduce a mixture of sulphate of iron and sublimed sulphur into an earthenware retort, and apply a low red heat, when sulphurous acid is disengaged, which is passed through a vessel containing some porous matter, such as moss, to retain mechanical impurities, and then transmitted through a series of bottles containing water, where it is dissolved to the extent of forty volumes of the gas for every one volume of the water. The bleaching of wool by sulphurous acid is not so complete as the bleaching of cotton or linen by chlorine. In the latter case, the color is destroyed, but in the former, the sulphurous acid merely combines with the coloring matter to produce a colorless compound, from which the color can again be revived, either by soaking the wool in a dilute acid, such as sulphuric acid, or a dilute alkali, such as soda. Hence it is that new woolen cloth or garments, such as flannel, blankets, and underclothing, though almost colorless when purchased, yet after being washed several times, return to their natural yellow; for the soda used, as well as the soap which contains potash or soda, destroys the colorless compound formed in the texture of the wool during the sulphuring, and resuscitates the original color.

Bleaching of Silk is carried on in a manner very similar to that pursued in the bleaching of wool. The silk has naturally a good deal of wax, accompanied by oil and coloring matter, enveloping the fiber, and the silk stuffs are repeatedly boiled in water containing a little soap or carbonate of soda, the alkaline nature of the solution being occasionally tempered by the admixture of some bran, which contains an acid. When well scoured and washed, the silk is obtained white enough for many kinds of printing; but where it is desirable that a pure white be obtained, the silken stuffs are introduced into a very weak solution of sulphurous acid, and thereafter thoroughly washed.

Other substances employed in the arts and manufactures are subjected to a process of bleaching; as the rags which are being manufactured into paper (q.v.), the palm-oil which is being converted into candles (q.v.) and night-lights, and the straw (q.v.) of which hats or bonnets are made; but the details of the processes followed in these and other operations, will be described more properly under their respective headings.

Bleaching Powder, a combination of chlorine and dry slaked lime (see Bleaching), was first manufactured on a large scale in Glasgow by Mr. Charles Tennant, who obtained a patent for its preparation in 1799. The substances employed in preparing the chlorine are common salt (chloride of sodium), black oxide of manganese, and sulphuric acid. The operation may be conducted in one or in two stages. The vessel used is a still. The whole apparatus is made of strong sheet lead, or of cast iron, or of grooved stones fitting closely. The more general plan is to have the upper part of lead and the under part of cast iron. The lower third of the still has usually a double jacket, or double walls, between which steam is admitted through a pipe for heating the contents of the still. In using the apparatus, 100 parts of black oxide of manganese (MnO_2) and 150 parts of common salt (NaCl) are introduced by an opening in the top, which is closed by a water-joint; 185 parts of sulphuric acid (SO_3), of specific gravity 1600, are then poured in by a funnel, and on the admission of steam into the jacket, chlorine is evolved, and issues by a tube at the head of the still. The theory of the changes that occur in the still is represented in the following table, there being two equivalents or atomic weights of sulphuric acid for one equivalent of each of the other ingredients:

Chloride of sodium (NaCl)	Cl, Na	Chlorine *escapes as gas.*
Oxide of manganese (MnO_2)	O, Mn, O	
Sulphuric acid (SO_3)	SO_3	
Sulphuric acid (SO_3)	SO_3	
	$MnOSO_3$, Sulpnate of manganese,	$NaOSO_3$, Sulphate of soda,
	left in still.	

The pipe which carries away the chlorine gas is connected with a stone or leaden chamber, into which it enters at one or more points, and the chlorine entering, comes

in contact with dry slaked lime in fine powder, with which the floor of the chamber is covered to the depth of some inches. The chlorine is rapidly absorbed by the lime, which, when the absorption flags, is stirred from time to time by wooden rakes. The process must not be allowed to proceed too quickly, as much heat is evolved during the combination of the chlorine with the lime; and if the temperature of the chamber rises beyond 110° F., the power of combination is very much lessened.

The material which is left in the still as a residuum, consisting of the sulphate of manganese and the sulphate of soda mixed together, is comparatively worthless, and accordingly it is found more economical in large chemical works to divide the process of the manufacture of B. P. into two stages, at each of which the residuum is of commercial use, and can be worked up into marketable products. The first stage is to heat the common salt and sulphuric acid together, when hydrochloric acid (q.v.) is disengaged in the gaseous state, and is received in proper vessels, and the sulphate of soda—from which common soda (q.v.) is prepared—is left in the retort or still. The hydrochloric acid thus obtained is then placed along with the black oxide of manganese in the still, and on the steam-heat being applied, chlorine is evolved and is conducted to the lime chamber, while chloride of manganese and water are left in the still. The decomposition is stated thus:

Hydrochloric acid	Cl, H	Chlorine *escapes as gas.*
Oxide of manganese	O, Mn	
Hydrochloric acid	H, Cl	

MnCl, Chloride of manganese, HO, Water, HO, Water, *left in the retort.*

The chloride of manganese can be returned to the condition of black oxide of manganese, and used again and again. See MANGANESE. The B. P., prepared either in one or two stages, contains, when freshly and fully manufactured, generally between 30 and 40 per cent of chlorine, and the strength of any sample is determined by the process of chlorimetry (q.v.). The composition of B. P. is expressed by the formula $CaCl+CaOClO$, and it is regarded as a double salt of the chloride of calcium and hypochlorite of lime. For its employment as a decolorizing agent, see BLEACHING.

BLEAK, *Leuciscus alburnus*, a small fresh-water fish of the family of *cyprinidæ* (q.v.), of the same genus with the roach, dace, minnow, etc. See LEUCISCUS. It is seldom more than 6 or 7 in. long; in general form it resembles the dace, but is more elongated; the dorsal fin is placed further back, and the base of the anal fin is longer; the nose is pointed, the under-jaw the longest; the scales are of moderate size, and beautifully striated; the back is of an olivaceous green color; the sides, belly, cheeks, and gill-covers, shining silvery white; all the fins nearly white. The tail is forked for half its length. The B. is found in many of the rivers of Europe. On the inner surface of the scales of the B., as of white-bait, roach, dace, etc., a silvery substance, from which they derive their beautiful luster, is found in such abundance as to be much used for making artificial pearls (q.v.), the white beads so common in ladies' head-dresses, and similar ornaments. That obtained from the scales of the B. is preferred to that of the roach and dace, but is inferior to that of the white-bait. It readily separates from the scales when they are soaked for a time in water, and settles to the bottom of the vessel. Small glass tubes are then dipped in it, and it is injected into thin hollow glass beads of the requisite forms and sizes, which are placed in a current of air to dry, and are sometimes further filled with wax.—The B. is singularly liable to be infested by a species of tape-worm.

The B. is an inhabitant of most of the English rivers which contain roach and dace. It is a very restless, active little fish, constantly playing about the top of the water, in search of small flies and other food. A small piece of bread cast into the water becomes speedily surrounded by a shoal of them, and it is amusing to watch them darting to and fro at it with increasing pertinacity. It is not only a pretty little fish, but is, withal, delicate eating; and a dish of well-cooked B. is scarcely inferior to gudgeons. They should be cooked in the same manner as sprats, which they rather resemble in shape and appearance. The best way to catch B. is to angle for them with a single gentle and a light quill-float, the bait being about a foot under water; they may be caught with very small flies, and all the more easily if the hook be pointed with a gentle. They are so active that the angler cannot strike too quickly, and where they abound they form good preliminary practice for the young fly-fisher. The neighborhood of running drains are very favorite resorts for B., and the angler can soon determine if there be any about, by casting on the water a handful of bran, when, if there be any, they will immediately rise at it

BLEBS (allied to *bulb*—Lat. *bulla*, a bubble) are transparent bladders or blisters of the cuticle, which make their appearance in some forms of fever, in erysipelas, and in disorders of the digestive apparatus. There are three varieties of B. recognized by physicians: 1. The mild B., which vary in size from a pea to a hazel-nut, occur on the face, neck or arms, and legs of teething infants, and of young persons who have indulged in unripe fruit. They generally burst, discharge the clear fluid they contain, and heal up again in three or four days. 2. The tedious B., which most commonly affect aged and weakly persons, are seen as an eruption of numerous red elevations, which enlarge to the size of a pea, containing pale yellow serous fluid. These vesicles multiply to such an extent that the sufferer is disturbed at night from the irritation, and slight febrile attacks further debilitate him. 3. The solitary bleb generally selects old women for its victims, and appears, after much tingling of the skin, as one large vesication, and bursts in 48 hours, leaving a superficial sore.

The treatment consists in correcting the secretions, limiting the diet to what is farinaceous and easy of digestion, cooling drinks and tonics. For local treatment, the irritated surfaces are to be soothed by poultices and water-dressings.

BLEDSOE, a co. in s.e. Tennessee; drained by Sequatchie river; 330 sq.m.; pop. '70, 4870—709 colored. Surface rough; productions agricultural. Co. seat, Pikesville.

BLEDSOE, ALBERT TAYLOR, LL.D., b. Ky., 1809; graduate of West Point; served as lieutenant of infantry, but resigned in 1832, becoming professor of mathematics successively in Kenyon college, in Miami university, and in the university of Virginia. During the rebellion he was assistant secretary of war in the southern confederacy. He has published several theological works, has been a frequent contributor to periodical reviews, and is now the editor of the *Southern Review*, a Methodist magazine.

BLEEDING (*hemorrhage*) is one of the most serious accidents which can happen to an animal, and constitutes the most anxious complication in surgical operations. As there is but a limited quantity of blood in the body, and as the sudden escape of a large portion of it is sufficient to cause death, every one should be instructed as to the measures which experience has shown to be the most efficient for preventing a dangerous loss of blood.

B. may be either from a wounded artery or vein, or from a raw surface; and it may be in the form of a general oozing from the surface of a sore or a mucous membrane. We shall consider these varieties separately.

Arterial B. is recognized by the florid redness of the blood, and by its issuing from the cut vessel *per saltum* or by jerks. There are exceptions to this, however. When an artery has been tied, and bleeding occurs from below the ligature, the flow of blood is continuous, and of a dark color.

If a large artery be wounded, the first gush of blood may prove fatal, but in general the patient faints, and nature takes advantage of the respite to place the cut artery in circumstances as favorable as possible to the preservation of life; viz., the artery draws up within its sheath (see ARTERY); the blood, no longer impelled vigorously by the heart, clots between the cut end and the cellular tissue surrounding it; the inner and middle coats not only *re*tract but *con*tract, and another clot forms within the arterial tube. These clots—which, with the faintness and the contraction and retraction of the artery, are termed natural *hæmostatics* (blood-stoppers)—are sufficient in many cases to prevent a recurrence of the B.; but such a happy concurrence is not be depended on, and we must be prepared to adopt some of the many surgical or artificial means for restraining the flow of blood till adhesion (q.v.) can occur between the cut surfaces of the coats of the artery. The principal surgical means are:

Immediate pressure, which may be applied by pressing the finger-tip on the place whence the blood is seen to flow, and may be kept up by pads of lint, or a coin of convenient size wrapped in cloth, and secured with a bandage to the part.

Pressure on the artery above, or as it comes to the cut part. This requires some knowledge of anatomy, but not more than any intelligent person may easily acquire. Thus, pressure on the inside of the arm, about midway between its front and back, will press the brachial artery (q.v.) against the bone, and arrest any bleeding from wounds of the forearm and hand. Pressure on the middle of the groin with a thumb placed crosswise will control the stream of blood in the femoral artery, so that none can escape from any wound below where the pressure is made.

Pressure on the course of the vessel may be very efficiently effected by tying a handkerchief round the limb above where it is injured, and then inserting a stick and twisting it sufficiently tight. This is the principle of the original tourniquet, which was invented by Morel, a French surgeon, at the siege of Besançon, in 1674. He got the idea from seeing how carriers tightened the ropes which secured bales of goods on their carts. It has been modified from time to time. At present it consists of a strap and buckle, a pad which may be adjusted over the course of the artery wounded, or likely to be cut in an operation, and a screw by which the strap may be tightened as the surgeon may deem necessary. See TOURNIQUET. The objections to *pressure* as a means of arresting hemorrhage, are, that it is very painful, that it includes the vein, and thereby engorges the limb with blood, and may cause mortification, if continued for any length of time.

"*Actual*" *cautery*, or hot iron, is occasionally useful in bleeding from a bone, or at some points where pressure cannot be efficiently applied. It is the oldest method of stopping bleeding, and until the 18th c., was much in use; but its abuse and the natural horror felt for it by both patient and surgeon, have almost banished it from the list of surgical hæmostatics. If used, the iron should be at a white heat, the wound pressed for an instant, and then the iron should be held in contact with the bleeding vessel. It causes an eschar or slough, with shriveling of the artery; and if the latter be small, it effectually stops the bleeding, until the eschar drops off, when the vessel may be found still pervious at the wounded part, and the danger of bleeding be as great as at first.

Ligature, or tying the artery, is a very old method of arresting hemorrhage, and certainly the best. It was not used generally, however, in operations until improved anatomical knowledge and more efficient tourniquets allowed surgeons the time necessary for its application. See LIGATURE.

Another method was introduced by the late sir James Y. Simpson of Edinburgh, and has been already extensively used. He termed it acû-pressure, or pressure from a long needle or pin inserted from without, so as to press the artery between it and the tissues. The pins are removed after 24 or 48 hours, the period being proportioned to the size of artery to be secured. This new plan promises to supersede the ligature, in amputations especially, where the vessels can be easily secured, and where occasionally they are found so brittle from disease (see ATHEROMA) as to break under the pressure of a thread.

Venous B. is recognized by the dark color of the blood, and its continuous flow. Pressure is generally found sufficient to arrest it, and it should be applied directly over the wounded part. Ligatures are not used to secure cut ends of veins, as inflammation of the lining membrane of these vessels is apt to spread along them towards the heart (see PHLEBITIS), and produce dangerous symptoms, and very frequently fatal results. There is not the same objection to the use of acû-pressure pins. Of course, if a large vein is wounded in a part where compression cannot be readily applied, the surgeon should have no hesitation as to tying it; and if it is not cut quite through, he may pick up the cut edges in a forceps, and tie them so as to still permit a flow of blood through the vein.

Oozing from cut surfaces of course partakes of the characters of venous and arterial B., but there is no vessel sufficiently large to demand a ligature pressure. The actual cautery and cold may then be used, or one of the many styptics, the strong perchloride of iron may be specially recommended; it may be applied on lint or a sponge; or astringents, such as alum and tannin; there are also the puff-ball, mushroom, agaric, and matico leaves, cobwebs, felt, etc., which act mechanically, and owe their reputation chiefly to the pressure used in their application. Some persons have a congenital tendency to bleed (the hemorrhagic diathesis); if such a one have a trifling cut, or have a tooth pulled, he bleeds perhaps to death. A prudent surgeon will not perform cutting operations on one of a hemorrhagic family.

B. from the free surfaces of mucous membranes occurs when they are much congested. One may have fatal hemorrhage from the stomach, and yet no open vessels may be found after death, even on the most careful examination. In such a case, we must trust to cold and internal remedies, such as acetate of lead combined with opium.

BLEEDING or BLOODLETTING.—Blood may be drawn from a vein (phlebotomy—venæsectio), or from an artery (arteriotomy).

The veins most commonly opened for this purpose are those at the bend of the elbow (see ARM), but those of the lower limbs are occasionally selected. The patient should be placed sitting up in bed, as he may lose a dangerous amount of blood without showing the usual premonitory symptoms, if his head be kept low.

The venous return should now be obstructed by a bandage, and when the veins swell, one should be selected, steadied with the left thumb, and slit obliquely with a lancet; the blood allowed to flow till the desired quantity has escaped, or till faintness comes on. The surgeon's thumb should now be replaced on the cut in the vein, and kept there till the bandage is removed, when a small pad of lint and figure of 8 bandage will sufficiently prevent the bleeding, and the wound will speedily heal.

Phlebotomy was at one time habitually resorted to in inflammatory diseases, or such as were thought so; and even when there was no positive disease, it was often applied periodically at particular seasons, as spring and autumn, as a hygienic precaution. A great change in this respect has taken place in medical practice; as physiological knowledge advances, the opinion seems gaining ground that abstracting blood from a sick man gives him but temporary relief, and renders him less able to combat with the disease. When there is a wound of the cavities of the body with internal hemorrhage, venesection is very useful in lowering the heart's action, and perhaps, according to the old theory, in exercising a *derivative* influence on the wounded vessels. Local B. is effected by cupping and leeches. See articles on these.

Arteriotomy is generally performed on the temporal artery, by a transverse cut about half way through the vessel. When the required amount of blood has been abstracted, it ought to be completely cut across, to allow of its ends retracting and healing. If this precaution is neglected, an aneurism (q.v.) would form. A compress and bandage should be put on the head for a day or two.

BLEEK, FRIEDRICH, 1793–1859; a celebrated biblical scholar of Germany, educated at the university of Kiel, and in Berlin, under de Wette, Neander, and Schleiermacher. In 1818, he was tutor in theology in the university of Berlin. Soon afterwards he published essays on the *Origin and Composition of the Sibylline Oracles*, and on the *Authorship and Design of the Book of Daniel*, in which he attracted attention by solid learning, thorough investigation, and candor of judgment. After suffering loss of place from some unjust suspicions of a political character, in 1829, B. took the chair of theology in the newly founded university of Bonn, where for 30 years he labored with constantly increasing success, by reason of the thoroughness of his investigations, the impartiality of his judgments, and the clearness of his methods of presentation. In 1843, he was promoted to the office of consistorial councilor, a distinction not since conferred upon any theologian of the Reformed church. He died suddenly of apoplexy, having given his regular lecture on the previous day. His defense of the genuineness of the gospel of St. John is regarded as one of the strongest that has yet appeared, and his critical labors on the New Testament are among the most important contributions to the maintenance of the evangelical faith that the time has produced. His greatest work is the *Commentary on the Epistle to the Hebrews*. Many of his critical works were published after his death.

BLEEK, WILHELM HEINRICH IMMANUEL, 1827–75; son of Friedrich; distinguished for researches in the languages of Africa. He was educated at Bonn and Berlin. In 855 he went with bishop Colenso to Natal; the next year he settled at Cape Town as interpreter to sir George Gray, and he died there. Among his works are the *Vocabulary of the Mozambique Language, Handbook of African, Australian, and Polynesian Philology, Comparative Grammar of South African Languages, Hottentot Fables and Tales*, etc.

BLEI'BERG, a t. of Austria, province of Carinthia, in the circle of, and about 8 m. w. of Villach, pleasantly situated in the valley of the Drau, or Drave, near the celebrated Bleiberg (Lead Mountain). The pop. '69, 4061 in number, are chiefly engaged in the mines of the Bleiberg—from which 1500 to 1800 tons of lead are annually obtained—and in washing and smelting the ore.

BLEMYES, or BLEMMYES, an ancient African people, in and around the Libyan desert. In the 2d c., while Egypt was under Roman rule, they made predatory incursions into that province, and Diocletian made important concessions to them. They were powerful and annoying as late as the 7th c., and old authors tell strange stories of their savage appearance and habits. It is supposed that the Ababdeh, the Bishareen, and other tribes are their descendants.

BLENDE (Ger. *blenden*, to dazzle), a name given to a number of minerals composed chiefly of sulphur and of certain metals, all or almost all of splendent luster, at least in fractures and the faces of crystals. It is also very often popularly applied more exclusively to one of these minerals, to which alone, perhaps, it originally belonged, ZINC B., or GARNET B.; also called, according to its chemical composition, *sulphuret of zinc*. Among English miners, it is known as *black-jack*. It is abundant both in primitive and in secondary rocks in many parts of the world, and is often associated with galena (q.v.), or lead-glance. It contains about 66 parts of zinc and 33 of sulphur, and is used as an ore of zinc (q.v.); but the reduction of it is attended with difficulty, which much diminishes its value. It is usually brown or black, sometimes red, yellow, or green. It occurs both massive and crystallized in rhomboidal dodecahedrons, octahedrons, and tetrahedrons. Macles, or twin crystals, are remarkably common. It is very brittle; before the blow-pipe, it decrepitates violently, but only fuses on thin edges.—MANGANESE B. is a rare mineral, composed of sulphur and antimony.—ANTIMONY B., or *red antimony*, is also a rare mineral, composed of sulphur and antimony.—RUBY B. is a name sometimes limited to pyrargyrite, or red silver (see SILVER, ORES OF); sometimes extended as a sort of generic term to include a number of other minerals composed of sulphur and metals, among which are cinnabar (q.v.), realgar (q.v.), and orpiment (q.v.).

BLENEAU, a village of France, in the department of the Yonne, about 29 m. w.s.w of Auxerre, celebrated as the place where Turenne gained a victory over the Prince de Condé in 1652. Pop. '76 1433.

BLENHEIM (Ger. *Blindheim*), a village of Bavaria, 23 m. n.n.w. of Augsburg, memorable in connection with Marlborough's great victory over the French and Bavarians, Aug. 13, 1704. The battle, however, did not actually take place here, but at a village in the vicinity called Höchstädt, and is known to the Germans by that name. France and Bavaria, on the one hand, stood opposed to Holland, England, Austria, Savoy, Portugal, and the German empire, on the other. The French and Bavarian army consisted of 56,000 men, commanded by Tallard, Marsin, and the elector of Bavaria. Opposed to it was an army of 52,000 men, under the command of Marlborough and prince Eugene. The French and Bavarian generals had no idea that the allies would act on the offensive, and accordingly, when, about two o'clock in the morning, on the 13th Aug., the line of the allies put itself in motion, they believed that it was about to retreat. Even at seven o'clock, when the heads of the eight columns advancing under Eugene and Marlborough became visible, Tallard regarded the whole proceeding as a stratagem to cover the retreat. When the mistake was discovered, the army was hastily

drawn up in battle-array, and fought with dauntless courage; but at five in the afternoon Marlborough broke through the line of battle, and won a victory most complete and decisive. The French and Bavarians left about 10,000 killed and wounded on the field, vast numbers were drowned in the Danube, and about 13,000, including Tallard, were taken prisoners. Altogether their loss was estimated at between 30,000 and 40,000; 120 pieces of cannon and 300 standards were captured. The loss of the victors amounted to about 5000 killed and 8000 wounded. Near to B., also, the French defeated the Austrians in 1800.

BLENHEIM DOG, or MARLBOROUGH DOG, a small and very beautiful variety of spaniel, much resembling the King Charles spaniel (q.v.) in form and general appearance, but differing in the color, which is white, with orange or flame-colored markings. In weight it should not exceed five pounds. The B. spaniel is the *pygmæ* of Buffon. It derives its English name from Blenheim palace in Oxfordshire, the seat of the dukes of Marlborough, where the breed has been preserved since the beginning of the 18th century. These dogs are sometimes sold at an enormous price.

BLENHEIM HOUSE, near Oxford, the seat of the duke of Marlborough, erected at the public expense in the reign of Queen Anne as a testimony of gratitude to the victor of Blenheim (q.v.). £500,000 was voted for the purpose, but that sum did not suffice for the completion of the work. The royal estate of Woodstock, in which it stands, was granted at the same time. The building was designed by sir John Vanbrugh, and is a grand though heavy monument of his powers as an architect. The length of the principal front from wing to wing is 348 feet. The interior is proportionally magnificent, and the collection of paintings is one of the most valuable in Britain. Among the objects of interest in the grounds are a triumphal arch, and a column 130 ft. high, surmounted by a statue of Marlborough. An inscription on the pedestal, written by Bolingbroke, recites the public services of the hero. The manor of Blenheim park embraces a circuit of about 12 miles.

BLEN'NERHASSET, HARMAN, 1764–1831; b. England. He was bred to the law in Ireland, but sold his estates in Ireland for more than $100,000 and came to the United States. He remained in New York a short time, and finally settled on an island in the Ohio river, just below Parkersburg, Va., where he built a delightful residence, and dispensed the most elegant hospitality. Here Aaron Burr interested him in his scheme for seizing Mexico, where, in case of success, Burr was to be emperor, and B. a duke and ambassador to England. B. expended large sums in fitting out an expedition, and, though discouraged when he learned Burr's real design, the intriguer had such influence with his wife that B. still adhered to him. He was arrested and held for trial, but Burr's acquittal set all the suspected persons free. His beautiful island and home had been sacrificed by creditors, and he returned to Natchez a bankrupt. He undertook a cotton plantation, but the war with England ruined commerce, and he then removed to Montreal, where he practised law. In 1822, he went to Ireland to secure certain property, but failed, and continued to fail in every project. In his last years he was supported by a sister who left a small estate to his wife and children. B. married a daughter of Gov. Agnew of the Isle of Man. She was a woman of superior culture, and authoress of several poems, among them *The Deserted Isle*, and *The Widow and the Rock*. She came to the United States after her husband's death, and petitioned congress for a grant in reparation of her great losses, but she died before final action was taken, and was buried by the sisters of charity in New York. A son, Joseph Lewis, was a lawyer in Missouri. The *Blennerhasset Papers*, with a memoir, were published in 1864.

BLENNORRHŒ'A (*blenna*, mucus; *rheo*, to flow) is a medical term for an unusually copious discharge from any mucous membrane; but as it does not completely express the nature of such fluids, modern writers do not often make use of it. *Mucus* is a pellucid, ropy substance, which, according to sir James Paget, "has no corpuscles or organized particles" of its own. In those discharges termed blennorrhœal, on the other hand, there is a mixture of epithelial scales shed in large quantities from the mucous membrane (mucous cells), and occasionally pus cells. In B. of the lachrymal sac, or what is called "watery eye," if the inner corner of the eye be pressed by the fingers, an opaque, milky fluid will appear between the lids, instead of the transparent tears which are present when the lachrymal apparatus is in health. After inflammations of the genito-urinary mucous membrane, a gleety discharge frequently occurs, and continues for a long period. The treatment consists in establishing a robust state of health by tonics and the preparations of iron, fresh air, and careful regimen, with astringent lotions applied directly to the mucous membrane, such as alum, tannin, etc., to lessen the quantity of the secretion, and occasional caustic stimulants, as the nitrate of silver, to alter the depraved condition of the secreting membrane.

BLEN'NY, *Blennius*, a genus of acanthopterygious (q.v.) fishes, the type of a family, *blenniidæ*, very nearly allied to the family of *gobiidæ* (see GOBY), and by many naturalists included in it. To the B. family, the wolf-fish (q.v.) and the gunnel (q.v.) or butterfish are referred. The fishes of this family are generally remarkable for the abundance of slimy matter with which their skin is covered. Many are destitute of scales. The body is generally of an elongated form. They have only one dorsal fin, which, how-

ever, seems in many of them as if composed of two parts. They are distributed in the seas of all parts of the world.—The true blennies are small fishes, living in shoals, which do not consist of great numbers, frequenting rocky coasts, and often found in pools left dry by the tide, or even among the wet sea-weeds, among which they are capable of subsisting for a much longer time than that of the absence of the tide. They possess the power of using their ventral fins to aid them in moving about among rocks and sea-weeds. They have a fringed appendage over each eye. They are seldom thought of as an article of food, but are much in request for the aquarium, on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. Several species are found on the British coasts.—Many of the B. family retain their eggs within the oviduct until they are hatched, so that the young are produced alive, and capable of seeking food for themselves. An example of this is found in the viviparous B. (*Zoarces viviparu*) of the British coasts.

BLÉRÉ, a t. in the department of the Indre-et-Loire, France, is situated on the left bank of the Cher, which is here crossed by a bridge, said to owe its origin to Henry II. of England, about 15 m. e.s.e. of Tours. B. is the entrepôt for most of the traffic on the Cher. Pop. '76, 2043. In its vicinity is the castle of Chenonceaux, the residence purchased by Henry II. of France for the celebrated Diana of Poitiers, who lavished much money on its embellishment, as did also Catharine de' Medici, after she had dispossessed Diana. In 1733, it became the property of M. Dupin, whose wife, by her beauty and wit, attracted to the castle almost all the distinguished literary and scientific men of that day, including Montesquieu, Voltaire, Fontenelle, Buffon, Bolingbroke, and Rousseau. The castle escaped the fury of the revolution, and is still in a good state of preservation. Among the curiosities shown to the visitor is the mirror used by Mary Stuart (queen of Scots) on her marriage with the dauphin.

BLESSED THISTLE. See THISTLE.

BLESSINGTON, MARGARET, Countess of, b. Sept. 1, 1789, at Knockwiet, near Clonmel, Tipperary co., Ireland, where her father, Edward Power, was settled. At the early age of 15 she was married to capt. Farmer, and shortly after his death, to Charles John Gardiner, earl of Blessington. With him she took several extensive journeys on the continent, where, as well as in London, she gathered around her all the most distinguished men of the time. In Genoa, she formed an intellectual friendship with lord Byron, and afterwards resided in Paris, until the death of her husband, in 1829. The latter left her a good fortune, which enabled her to gratify her literary tastes. She held a little court of her own, at her family mansion, Gore house, Kensington, a suburb of the w. end of London. Her celebrated soirées were frequented by many of her distinguished contemporaries. Her subsequent connection with count d'Orsay placed her in an equivocal position as regards society, and, consequently, on the accession to power of Louis Napoleon, with whom both were intimate, they left England for France. Her ladyship died at Paris, 4th June, 1849. She was the authoress of two works of little importance, the *Idler in France*, and the *Idler in Italy*. Her only valuable production is her *Conversations with Lord Byron* (1834), which helped to place the poet in a more favorable light before his countrymen.

BLETCHINGLEY, a t. in the s.e. of Surrey, 20 m. s. of London. Pop. '71, 1916, chiefly agriculturists. Many Roman coins have been found in the vicinity. Near B., 2000 to 3000 tons of fuller's-earth are raised annually. In cutting the B. railway tunnel, the fossil bones of the iguanodon, an extinct reptile, were found.

BLETS, rotten spots in apples, pears, and other fruits. The rotting of such fruits is often called *bletting*. It takes place chiefly by the decomposition of the protein (q.v.) compounds which the fruits contain, and the fermentation of the sugar; carbonic acid is formed; and the fibers of a fungus can be discovered by the microscope pervading the bletted part, to the rapid extension of which they no doubt greatly contribute, although it by no means follows that the presence of the spores or seeds of the fungus should be regarded as the original cause of the decay.

BLICHER, STEEN STEENSEN, one of the most distinguished of modern Danish poets and novelists, was b. in 1782, at a village of Viborg; and took his theological degree at Copenhagen in 1809. He remained with his father, himself a pastor in Jutland, till 1819, when he obtained a living, which he exchanged, in 1825, for a better. Independent in character, and belonging neither to the poetical nor scientific circles of the capital, he was long known only as the successful translator of Ossian, 2 vols. (1807–9). His *Sneeklokken* (1826), and still more, his contributions to the monthly periodical *Nordlyset*, brought him into fuller notice; and in 1829, his *Jydske Romanzer* had a great measure of success, and his *National Noveller*, giving a poetical and faithful picture of country life in Jutland, were even better received. As a poet, B. is thoughtful, tender, and eminently national, but he lacks objectivity. His novels appeared in 5 vols. (Copen. 1833–36), his poems in 2 vols. (1835–36), and these were followed by *Samlede Noveller og Dichte* (1840), and *Gamle og nye Noveller* (1847–48), etc. He died in 1848. Specimens of B. are given in *The Danes sketched by Themselves*, by Mrs. Bushby (1864).

BLIDAH, a t. of Algeria, in the province of Algiers, about 30 m. s.w. of the city of that name. It is beautifully situated on the borders of the fine plain of Metidjah, is sur-

rounded by gardens, and is a prosperous and rapidly growing place. It was occupied by the French in 1838. Pop. about 9000. It is a station on the first line of railway in Algeria. The foundation-stone of the railway station was laid in 1859, in the presence of a large number of Arabs, who regarded the ceremony with intense interest.

BLIGH, WILLIAM, an English admiral, b. 1753, celebrated in connection with the mutiny of the *Bounty*. Having made a voyage round the world under capt. Cook, he was sent out, Dec. 23, 1787, by the British government, as commander of the ship *Bounty*, to Tahiti, there to collect bread-fruit-tree plants, and thence sail with them to the West India colonies, where government was anxious to introduce them. The ship arrived at her destination in Oct. of the following year, and in six months after was ready to sail for Jamaica, with 1015 plants on board. Partly on account of their demoralization by their lengthened residence on so charming and productive an island, and partly owing to the harsh and tyrannical treatment they met with from their commander, a part of the crew mutinied, after they had been 24 days out, on the 28th April, and forced the captain and 18 men into the ship's launch, which they cast adrift, turning their own course back to Tahiti, and ultimately settling on Pitcairn's island (q.v.). The captain and his companions, who had very little provision, and no sextant or map, arrived, after most incredible hardship, at the island of Timor, on the 14th June, a distance of 3600 nautical m. from the point where they were abandoned. To the skill and prudence of B., the fact that not a single life was lost, is chiefly to be attributed. On B.'s arrival in England, a man-of-war, under capt. Edwards, was sent, at his instance, to capture the mutineers. Some of them were seized; the rest had escaped to Pitcairn's island, with Fletcher Christian, the leader of the mutiny. Their place of refuge, however, was not discovered until 1808, when an American ship accidentally touched at the island. At that time, drunkenness, debauchery, and unbridled passion had left only one of the mutineers, John Adams, remaining. Their fortunes here were made the subject of a poem by Byron, entitled *The Island; or Christian and his Comrades*. B. was again sent out to collect bread-fruit trees, and convey them to the West Indies, in which he was completely successful. In the French revolutionary war, B. commanded a ship of the line, but again exciting the disaffection of his men by his harshness, they mutinied, and ran the ship into a French harbor. In 1806, B. was appointed governor of New South Wales, but his conduct here was so tyrannical as to cause universal dissatisfaction; and in 1808, unable to tolerate his rule, the civil and military officers of the colony summarily terminated his government by arresting him. He died in 1817.

BLIGHIA. See AKEE.

BLIGH ISLANDS, that portion of the Feejee archipelago originally discovered by Tasman, in 1643, which was seen by capt. Bligh of the *Bounty*, during his wonderful voyage in an open boat. The group lies in nearly 180° of long. and 15° 30′ to 19° 30′ s. lat.

BLIGHT, a diseased state of the cultivated grasses, especially of the cerealia. The term has been very vaguely and variously used, having, in fact, been applied to almost every disease of plants caused by the condition of the atmosphere, or of the soil, the attacks of insects, parasitic fungi, etc. It is frequently limited to the disease in wheat and other grains, which is also called SMUT-BALLS, BUNT, PEPPER BRAND, or STINKING RUST, in which, while the grain retains its usual form and appearance, the interior of it is filled with a powder of a very fetid odor, consisting of balls so minute that it is calculated that four millions of them may exist in a single grain. These are a parasitic fungus, *uredo caries* (*U. fœtida* of some botanists). See SMUT.—The name B. has been frequently applied to diseases which seem to be caused by errors in the manuring of land, by which crops are often seriously injured. Unhealthy plants are most liable to be attacked by parasitic fungi, and by aphides and other insects, to which the origin of the evil has often been, in all probability, erroneously ascribed. Mr. Berkeley, a high authority on such subjects, also states that "there is a kind of B. sometimes very prevalent, which has been referred to fungi, but which is, in fact, nothing more than an excessive development of the epidermal cells, which are no longer kept within bounds by the real cuticle," but become "elongated and frequently branched in various ways," so as to form spongy or mealy patches, which are sometimes in such abundance as from their bright color or peculiar aspect to attract general notice." He adds that this is most common on woody plants, as vines and hawthorns, but that something analogous is to be seen on a few herbaceous species, "a mere hypertrophy of the epidermal cells, or, indeed, mere fascicles of pubescence." This kind of B., however, does comparatively little injury.

BLIND, THE, those who are either partially or totally deprived of the sense of sight. Only a few are born blind, the greater number becoming so by accidents, small-pox, or diseases of the eye (q.v.), so that more than one half are above the age of fifty. Blindness prevails most in tropical, and least in temperate countries; more in the eastern than the western hemisphere. There are about 30,000 in the British isles. The balance between the outer and the inner world being disturbed, there is a tendency among the blind to self-consciousness, self-opinionativeness, and a desire to become the objects of attention,

and, if possible, surprise, if not admiration; hence there is more avowed infidelity than in any other class, although probably much of it is assumed, to attract attention, and display their controversial powers. As these tendencies are not strong in individuals, but become intensified when they are congregated together, it is now generally admitted that the more they associate with the seeing, and the less with one another, the better.

The first institution for the blind was founded in Memmingen by Weef VI., in 1178; the second, in Paris, by St Louis, in 1260; the first for the employment of the adult blind was opened in Edinburgh by Dr. Johnston, in 1793. There were in 1873 148 institutions for the blind in the world, two thirds of which have only recently been established. Though the blind, in general, are more or less dependent, yet many have earned a comfortable living, and even attained distinction in departments generally supposed to be to them inaccessible. The employments most adapted to their abilities are the making of baskets, brushes, mattresses, rugs, and such like; and for the women, sewing, knitting, and hair-plaiting. Many also have successfully competed with the seeing as musicians, music-teachers, and piano-tuners.

PRINTING FOR THE BLIND.—The first embossed book for the use of the blind was printed in Paris in 1784, by M. Valentine Houy, from flat movable letters, which his pupils had been previously taught to put together and read. Founts of types were cast and books printed; and having been approved by the academy of sciences, and exhibited before the royal family at Versailles, the art created at the time a great sensation. Large editions of a few volumes were printed at great expense; but as they were not easily read, and were used only for exhibition in the Paris institution, the interest soon died away, and the greater part of the editions was long after sold for waste-paper.

Printing can never be to the B. what it is to the seeing, and is chiefly of use for those gems of literature which can be read and re-read with interest. It is questionable, therefore, whether the art, after falling into abeyance for about 40 years, would have been permanently revived had it not been for the Bible, the book least wanted in Paris, but most wanted in Britain and America.

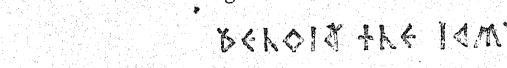
The merit of reviving it in this country is due to Mr. James Gall, of Edinburgh, who having in 1826 seen specimens of the Parisian books, and obtained a box of the types, was deeply impressed with the importance of putting the Bible into the hands of the blind, to employ their vacant hours. Being himself a printer and publisher, he at once saw the cause of the failure in France, and set himself to improve the alphabet, so as to make it more sensible to the touch. The following is a specimen of the Parisian type at that time:*

The principles which he laid down for his guidance were these: *First*, that the common alphabet (modified so as to be easily felt) is the only safe basis on which a literature for the blind can rest. He did not believe that any arbitrary character would be universally adopted or permanently adhered to; and as he looked forward to the blind being taught in common schools, not only to read, but to communicate with their seeing friends, he thought it indispensable that the books should be legible to all. *Second*, that the printing should be so large and legible that the adult blind should be able to read it *fluently*. It would have been easy to print books in a small type, which could be read by children only, and which, besides being much cheaper, would have astonished the public more; but he was of opinion that unless the adults were able to read easily, the books would not be read in private, and the object he had in view would not be attained. He also unhesitatingly preferred the common (low-case) alphabet to the capitals, which, though sufficiently well-known, are not fitted for the use of the blind. Their symmetry and general uniformity, which specially adapt them for titles and inscriptions, render them unsuited for common and easy reading, either for the blind or those who see. They are even less adapted for the finger than the eye, because the eye can see the interior parts of the letters by which they are distinguished; whereas the finger can feel only the exterior form. Thus E H K M N X Z appear to the finger as a succession of squares, O C G Q as a succession of rounds.

In 1827, after much study and many experiments, Mr. Gall printed his "first book" for teaching the blind to read in a triangular modification of the common alphabet. The embossing was in high relief, and although it presented rather a rude appearance, being printed from wooden types, it excited great interest and wonder when it was found that the blind could read it easily with their fingers. This was followed by other little volumes, including a series of *Scripture Statements*, and a condensed *Epitome of Old Testament History*. These were received with so much favor, that, in 1829, he issued a prospectus for the publication of the Gospel of St. John, at one guinea, which was to pay not only for the copies, but preliminary expenses. This work was printed in 1832, but was not published till 1834; the delay being caused by the efforts of some zealous friends to induce him to adopt some arbitrary alphabet before printing the Bible, which,

* In this, as in all the specimens which follow, the size is reduced to one quarter—that is to say, they are half the length, and half the breadth of the originals.

however, he firmly declined to do. The consequence was that, in 1833, the Scottish society of arts offered a gold medal, value £20, for the best alphabet for the blind; and this, although it increased the public interest in the newly revived art, had also the effect of paralyzing Mr. Gall's efforts, by preventing the public from giving him support until the result of the competition thus created had been ascertained. It would have greatly strengthened his hands if, as he hoped, they had awarded him the prize, for there was no other in the field; but, after waiting two years, he could wait no longer, and in 1834* he published his great work, *The Gospel by St. John*, which was the first book of the Bible which had ever been printed for the blind in any language. This volume was printed in a type so large and legible, that some of those whom he had taught were able at the public meetings to read any passage put before them through six plies of silk between the book and their fingers.



To make known the literature thus provided for the blind, Mr. Gall visited England and Ireland, as well as different parts of Scotland, teaching the blind who were brought to him to read and write in a few lessons. The writing apparatus will be described hereafter. Letters thus written were transmitted by post, and, as the same alphabet was used both inside and without, not only were the sealed contents read by the blind to whom they were sent, but the addresses also were read by the postman who delivered them. Great interest began to be excited throughout Britain, and extended even to foreign countries. Abbé Carton was sent by the Belgian government to visit Mr. Gall's establishment, and returned to set up a printing-press in Brussels, which has continued to supply books for that kingdom. Dr. Howe also, from Boston, visited Scotland, and having received from Mr. Gall all the information which he could supply, established, on his return to America, a printing-press in the Perkins institution. In 1834, he published the Acts of the Apostles, and completed the New Testament in 1836. About the same time, Mr. Jacob Snider, of Philadelphia, not knowing what had been done elsewhere, published the Gospel by St. Mark in 1834; but, as he had unfortunately adopted the capital alphabet, his books could not compete with Dr. Howe's; and, after printing the gospels and a few other volumes, his press ceased to be used. Dr. Howe, on the contrary, had adopted an angular modification of the common alphabet, similar to, but much smaller than Mr. Gall's, and with that printed the whole Bible, besides an ever-increasing number of other volumes in all departments, with which he continues to supply the whole of the United States. In Paris, also, the art was revived with great vigor, and a number of printing-presses were established in different parts of the continent.

Having thus succeeded so far as the blind were concerned, Mr. Gall was next anxious to improve the printing and lessen the cost, so that any village printer could make, it part of his ordinary trade, without requiring subscriptions from the public. By careful experiment, and with the help of his son, he was enabled to make the alphabet assume more of its usual form without losing its tangibility, and to enrich the sentences by the introduction of initial capitals for proper names, etc., as in common books. But the most important improvement consisted in the use of serrated types, by which the letters were formed of dots ⋯⋯ instead of lines. By this means the impression was not only sharper and more easily felt, but also more permanent, being better supported, as if by a series of arches, ∧∧∧∧∧ like corrugated zinc roofs. It was also found that when the paper was thus semi-punctured instead of being embossed, the common printing-press could print the sheets with half the pressure, and in half the time; and as the paper did not need to be nearly so thick as formerly, the books could be produced at one half of their former cost. In 1836, therefore, he offered to societies and publishers to print books for the blind in the improved type at so much per sheet, as an ordinary business transaction, without either subscriptions or donations. Of this offer the London Sunday-school union, the Religious tract society, and the British and Foreign Bible society, availed themselves in 1837, and in 1838 he printed for the British and Foreign Bible society the Gospel by Luke and the Acts of the Apostles (two of the eight volumes of the New Testament), which they were able to sell at 4s. each; and here ended Mr. Gall's labors for the blind, extending over a period of twelve years, during eleven of which (1826-37) he had been alone in the field.

As the institutions for the blind in those days "had not hitherto (as they expressed it) patronized any device of this kind," Mr. Gall had to contend single-handed with all the apathy and incredulity which every new thing has to encounter. But now the tide had turned, readers were multiplying over the country, schools for the blind were beginning to be formed, the institutions abroad had all "patronized the device," and printing-presses were busy both in America and on the continent; so that when the Sunday-school union, the London tract society, and the British and Foreign Bible society began to publish class-books, tracts, and Bibles for the blind, they all at once became con-

* The award was not made till 1837. Sixteen arbitrary alphabets had been sent in, all of which were rejected, and the prize was awarded to a Dr. Fry, of London, who had suggested the use of Roman capitals, which, in 1834, had already been tried in America.

vinced of its importance, and took it up with so much energy, that there was now no longer any danger of its being abandoned; and as Mr. Gall's work was thus practically accomplished, it was neither his interest nor his inclination to compete with them.

The first, and by far the most energetic, of the number was Mr. John Alston of Glasgow, who, having established a printing-press in the blind asylum, of which he was treasurer, printed in 1837 the Gospel by St. Mark in the same type in which (unknown to him) it had been printed in 1834 by Mr. Snider in Philadelphia. Through his influence it was at once adopted in the other institutions throughout the kingdom; and, having thrown himself with much enthusiasm into the work, he very soon raised funds by which he completed the New Testament in 1838, and the whole Bible in 1840. To him, therefore, belongs the honor of having printed the first complete Bible for the blind in any language, because Dr. Howe of America, although he commenced the work earlier, did not finish it till 1842. The effect was immediate and decisive, rivalry was extinguished, hundreds of the blind were brought under instruction, and reading was thenceforth acknowledged to be a necessary department of the education for the blind.

If Mr. Alston had adopted a modification of the low-case alphabet, and more especially, if he had printed his books in a much larger type, they would have been an unspeakable blessing to the blind in this country; because, not only would they have been universally adopted, but they would have continued to be used, and he would thus have prevented the lamentable confusion into which the printing for the blind in this country has fallen. But unfortunately Mr. Alston, being encouraged by the decision of the Scottish society of arts, which he himself had very much helped to influence, fell into the double error of adopting the Roman capitals for his alphabet, and making his type too small. The consequence was, that a reaction very soon took place, the blind themselves being the first to rebel. The want of sufficient legibility was in their judgment a fatal objection, and outweighed all other considerations. Even the large amount of money that had been expended, and the extensive libraries that had been formed through Mr. Alston's energetic labors, they were prepared to sacrifice, in order to obtain books which they could read with ease.

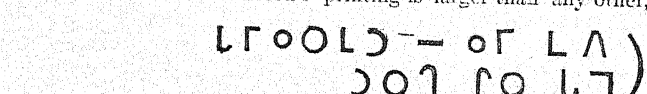
The second in the field, or rather simultaneously with Mr. Alston, was Mr. Lucas of the Bristol institution, who invented a most ingenious system of stenographic printing

with arbitrary characters and numberless contractions, by which he secured largeness of type and at the same time diminished the size of the books. He had in 1837 printed the Gospel by St. John, and in 1838 the Acts of the Apostles, but during the triumph and rapid multiplication of Mr. Alston's books little attention was paid either to him or his system; but when the tide turned, and legibility became the great desideratum, the value of his invention became apparent, and in 1839 a society was formed to aid Mr. Lucas in printing the Bible and teaching the blind to read upon his system. The blind were delighted with his books; his printing establishment was removed to London; large funds were collected; and the whole Bible and many other books were printed. (*Price of the New Testament*, £2.)

The third competitor was Mr. Frere of London, whose objections to Mr. Lucas' system were so strong, that he was induced to devise another, which was (as he himself

described it) "a scientific representation of speech, the alphabet containing only one character for each of the simple sounds of the English language." This opinion was shared by another large section of the friends of the blind; and accordingly, in 1839, another society was formed, another Bible was printed, another literature was created, and another illustration was supplied of the difficulty of securing the universal and permanent adoption of any arbitrary character for the blind. Mr. Frere had also the merit of inventing the "return lines"—that is to say, the lines in his books are read from left to right, and from right to left alternately, the letters themselves being reversed in the return lines. He also devised a cheap and very ingenious method of setting up and stereotyping his books, the letters being formed of small bits of bent wire laid on a tin plate, and fastened with heat. (*New Testament*, £2 10*s*.)

The fourth competitor was Dr. Moon, of Brighton. He, too, uses an arbitrary alphabet, some of the characters resembling or suggesting the letters which they represent. He has also adopted Mr. Frere's "return lines," but does not reverse the letters as Mr. Frere does. Mr. Moon's printing is larger than any other, and therefore more



easily felt. This is a great advantage to beginners, and to those whose touch is very obtuse, although no doubt his books are on that account both bulky and expensive. Nevertheless, this is by far the safest side on which to err, and therefore Mr. Moon's

books are great favorites with the blind. A society, having numerous branches, has been formed to extend this system, and the blind are sought out and taught in their homes. Many more blind persons can read on Dr. Moon's system than on any other. Besides the Bible, Dr. Moon has printed (embossed) an extensive literature, both in English and in many foreign languages.

A fifth system has been recently imported from Paris, invented by M. Braille, which consists of the sixty-two varieties of form which six dots, ⁘, can be made to assume by the omission of one or more of them. This supplies not only the letters of the alphabet,

but numerous other signs, of which he makes valuable use. There are two advantages which it possesses over all the others, and which it is supposed will cause it to supersede them. The first is, that it can be written easily by the blind themselves, by an apparatus to be afterwards described. The other is, that it affords the best method of writing and printing music for the blind which has yet been discovered.

A sixth system is an improvement on Braille, by Mr. Wait of New York, which, it is confidently predicted, will supersede all the others. The signs, like M. Braille's, are produced by six dots, but they are placed horizontally, thus, :::

At present, it is impossible to predict the triumph of any of these systems, as their respective advocates are not only determined, but able to keep their ground. But as recent legislation has made provision for the education of the blind in common schools, where the influence of rival societies and extraordinary geniuses, who are not the best guides for their less talented brethren, will not be felt, it is not improbable that some common system will gradually come into general use. In the report of the royal commissioners of the exhibition of 1851, surprise is expressed that Mr. Gall's labors should have been so summarily set aside, and they recommend now the universal adoption of Dr. Howe's books.

Writing for the Blind.—This is of two kinds; first, writing to be read *by the blind;* and, second, writing by the blind, to be read *by the seeing.* Messrs. Milne and M'Baine of the Edinburgh asylum invented the "string alphabet," by which they were enabled to communicate with one another. The letters were represented by different kinds of knots tied upon a cord singly or combined. This was superseded in 1838 by Mr. Gall's writing stamps, which, as they can be made to any pattern, have been much used. The paper is placed on a cushion frame, and a barred guide placed over it. The stamps are made of pins fixed in wood, and when pressed through thick writing-paper, produce a raised letter on the other side.

M. Braille's system of writing corresponds with his alphabet. Cartridge paper is placed over a grooved plate, with a guide having two rows of oblong holes. A blunt point forces the paper into the grooves, so as to produce the dots which form the letters on the other side. This is by far the most legible writing which has yet been provided for the blind, and is a strong recommendation of his alphabet for printing.

There are two methods of writing by the blind to be read by the seeing. The first is by Mr. St. Clair, a teacher of music in Edinburgh; the other is Mr. Gall's typlograph. In both processes the writing is produced by a hard pencil with a fine point, or by a blunt bodkin moving over carbonized paper, which deposits the blacking on the paper wherever it is pressed. Mr. St. Clair's guide consists of a line of small square holes, each of which represents a letter or a space. The steel point enters each hole, and makes

a letter, guided by the four sides. Mr. Gall's typlograph is a much more perfect instrument, and can be made to imitate any size or style of writing; but it is not so easily made. It consists of a hole of this shape, , cut in a thin brass guide, which slides freely between two wooden fillets, united at each end. The upper half of the hole is used when the guide leans against the lower fillet, and the lower half is used when the guide leans against the upper fillet. When the steel point has traced a line round the upper or lower half of the hole, it is stopped by the small projection in the middle of the right side—thus:

Arithmetic for the Blind.—There are three methods: 1. The *Parisian.* Embossed types are dropped into square holes in a perforated board, and read by the finger. 2. *Saunderson's.* Angular pins are dropped into angular holes, and indicate the figures

according to their position. The pentagonal is the most convenient form, because one pin having the two ends different can represent ten ciphers. 3. *Gall's* requires no apparatus at all, the ciphers being represented by common pins stuck into a quilted cushion or cloth of any kind, and the lines by twine stretched across—thus:

1 2 3 4 5 6 7 8 9 0

Although reading, writing, and tangible arithmetic are of great importance to the B., yet oral instruction is that upon which we must chiefly rely for their education. For that reason, the recent education act for Scotland, under which blind children may be educated in common schools, will be a great blessing to them.

BLIND, KARL, b. 1820; a German politician, arrested for political offenses while a student at Heidelberg, imprisoned, and subsequently banished for participation in the affair of 1848. He was also expelled from Alsace for complicity in the Paris insurrection. In Sept. after the conflict at Staufen, he was taken prisoner (with Struve) and sentenced to eight years' imprisonment. Eight months afterwards he was set free by a mob and went to Carlsruhe, thence to Paris, and thence to Brussels, being everywhere repelled, until, in 1852, he found rest in London. There for several years he kept up his violent political agitations, but after 1836 he became more quiet, a consequence, perhaps, of the death of a step-son in the Berlin affray of that year. He has published a great number of political essays, and brief articles on history, mythology, and German literature. In 1875, in the streets of London, an attempt was made upon his life by a political enemy. Among later works of his are *Fire-burial among our Germanic Forefathers; a Record of the Poetry and History of Teutonic Cremation, Yggdrasil, or the Teutonic Tree of Existence*, and biographies of Freiligrath, Ledru Rollin, and Francis Deak.

BLIND AGE. When a besieged town has little or no bomb-proof shelter, screens are sometimes used called B., made of timber and earth; or of trees inclined towards each other, or placed in an inclined position against walls.

BLIND COAL. See ANTHRACITE.

BLIND FISH. See AMBLYOPSIS.

BLINDNESS may arise from any cause intercepting the rays of light on their way to the optic nerve, or from disease of the optic nerve, or of that part of the brain connected with it. B. may vary in degree; it may exist from birth, or be the result of extreme old age. It may only be present during the day or the night, or a few weeks of the year, or it may be permanent.

Congenital B. is generally from some deficient development of the nervous apparatus, and is detected by the child being indifferent to light, and throwing its head from side to side. Occasionally, but very rarely, the power of vision is subsequently developed. Amaurosis has been already described.

Opacity of the vitreous humor, or of the crystalline lens—the latter is generally known as cataract—causes B. which comes on gradually. The patient with cataract can see best in the evening, or when the pupil is dilated, as then some rays of light are able to enter by the side of the opacity. The B. from cataract is seldom so complete as to prevent the person from distinguishing day from night, or from being aware of opaque bodies passing between him and the light (see CATARACT). Opacities of the cornea, if extensive, or in the axis of vision, produce some degree of B., whether they are on or in its substance. In general, these are irremediable; but if there is a spot, an artificial pupil may be made. Some years ago, Mr. Bowman, of London, met with a case in which the opacity consisted of a layer of phosphate and carbonate of lime: he removed it, and restored the vision, which had been totally lost for several years.

Night B. is a rare condition, in which a person finds, towards evening, that objects are becoming less and less distinct, and at last that he is totally blind. This may occur without previous warning, and cause great alarm, but next morning he finds that his sight is restored. This is repeated every night, but at last the eyes become weak during the day also, and may finally become amaurotic. This strange affection may be epidemic; it has attacked bodies of troops exposed to great fatigue and the glare of the sun's rays. If there are no symptoms of disease within the brain, recovery generally results from protecting the eyes from the light, entire repose, such remedies as correct any constitutional defect in the individual attacked, and repeated blistering.

Day B. is characterized by inability to see in a bright light; the subjects of it see more than usually well at night, but during the day have to be led about. Captives who have been long immured in dark cells are often affected with it, as a galley-slave mentioned by Larrey, who had for 33 years been shut up in a subterraneous dungeon, and when liberated could only see by night.

The structural causes of B. will be better understood when the eye (q.v.) is described, when it will be seen that advances in our knowledge of its anatomy have enabled surgeons to restore sight in cases which, some years ago, would have been considered hopeless; but it can never be too strongly impressed, especially on the young, that overwork wears out the eyes, whatever be the pursuit, and that, without being wholly dark, a

degree of blindness may be induced, such as to render the eyes useless for practical purposes. This condition, asthenopia or weak sight, is frequently met with in young lads with sedentary occupations, students, dressmakers; and, says Dr. Mackenzie of Glasgow, "what may be called the hothouse education of modern times is a fruitful source of it." The only cure is avoiding the evident causes.

BLINDNESS, COLOR. See COLOR BLINDNESS.

BLINDSTORY, another name for the *triforium* (q.v.), the second or middle arcade in the wall which separates the body from the aisles of a church. It is so called obviously as opposed to the *clearstory* or *clerestory* (q.v.), the third and uppermost arcade, the apertures of which admitted light into the church, while the apertures of the trifolium were dark—*obscuræ fenestræ*, as they are termed by Gervase of Canterbury. The B. which is most common in cathedral, conventual, and collegiate churches, served to give access to the various parts of the building, and to suspend tapestry and banners on high holidays. Viewed æsthetically, the gloom of the B. contrasts well with the luster of the clerestory.

BLINDWORM, *Anguis fragilis*, a small reptile, which, although it has commonly been ranked among serpents by naturalists, in consequence of agreement in general form, exhibits remarkable points of difference from the true serpents, and constitutes one of an interesting series of links by which they are connected with lizards. Mr. Gray has therefore recently united this, and other nearly allied genera, with the scink and seps family of saurian reptiles under the name of *saurophidia* (lizard-serpents), amongst which the gradation from the lizard to the serpent structure is marked by the more and more complete disappearance of limbs, and the increasing elongation of the body. In the genus *anguis* there is no trace of limbs externally, but the bones of the shoulder, the sternum or breast-bone, and the pelvis still exist in a rudimentary condition: the bones of the head, also, connect it with lizards, and do not admit of that dilatation of the gape which characterizes true serpents. The common B. is the only species of this genus known in Britain. It is found also in almost all parts of Europe. In some districts of Britain it is plentiful; in others, it is very rare or even unknown. It is a perfectly inoffensive creature, although it has very generally been persecuted by the ignorant as extremely venomous. Its teeth are so small that even when it attempts to bite, which it only does upon much irritation, it cannot pierce the skin. No species of the group to which it belongs has poison-fangs. It is very timid, and, when alarmed, contracts itself forcibly, and then becomes remarkably brittle, so as to be easily broken in two by a blow or by an attempt to bend it. This character of fragility is found also in other animals of this group. The name B. has apparently originated in a mistake caused by the smallness of the eyes, which, however, are very quick and brilliant. Another common name *slow-worm*, is more accurately characteristic. The length varies from 11 to 15 in., and sometimes even exceeds this; the thickness is almost equal throughout, the tail is blunt at the end; the scales are small, and nearly equal; the tongue is notched at the extremity, but not bifid as in snakes; the color is generally silvery gray, a dark line runs along the back, and frequently rows of dark spots along the sides. The food of the B. consists of slugs and insects. It retires in autumn under masses of decayed wood and leaves, or into soft dry soil. It changes its skin. It is viviparous (ovoviviparous), the number of young varying from 7 to 12 or 13 at a birth. The name B. is sometimes given to *cæcilia* (q.v.).

BLISTERED or **BLISTER STEEL.** This is the kind of steel from which, by hammering, rolling, etc., certain qualities of tools and files are fashioned. When broken up, piled, and welded under the hammer, it forms *shear steel* (see IRON), from which a finer class of tools is made, and when melted in crucibles it forms the finest kind of *cast steel* (q.v.) for cutlery. Blister steel is made from bar iron of superior quality by a process of *cementation;* and the furnace employed for the purpose is termed a converting furnace. It consists of two fire-brick rectangular chests or troughs, each being 16 ft. long and 3 ft. deep by 3 ft. wide, as a maximum size, placed alongside each other in an arched chamber, and surmounted by a wide conical chimney. One long fireplace, with a suitable arrangement of flues, heats both chests. Into each chest the iron bars are laid embedded in charcoal, about half an inch of which intervenes between each layer of iron bars. The whole is then plastered over with clay or grindstone-dust, and kept at a glowing red heat from 7 to 10 days, according to the purpose for which the blister steel is intended. When the bars are removed after cooling, they are found to have undergone a remarkable change. They are no longer tough, but quite brittle and fusible, and covered over with blisters. During the process, the iron absorbs and combines with from a half to one and a half per cent of carbon. The blisters are supposed to be due to the evolution of carbonic oxide arising from the combination of carbon with a trace of oxygen existing in the iron.

BLISTERING FLIES. See CANTHARIDES.

BLISTERS are medicinal agents which, when applied to the skin, raise the cuticle into small vesicles filled with serous fluid. They are applied either in the form of plasters or in a fluid state, as suits the convenience of the person or part, and have for their object the establishing of a counter-irritation or diversion of inflammatory action from

a part in which it cannot be reached by remedies, or from some organ where it may do permanent mischief, to some more superficial part of the body.

The most common blister in use is made of cantharides (q.v.) or Spanish fly (*cantharis vesicatoria*). Cantharides, mixed with a convenient proportion of lard and wax, form the blistering ointment of ordinary use; the only objection to this preparation being, that if applied too long it produces distressing affections of the urinary bladder. In young children and very thin-skinned persons, a layer of silver paper, or thin gauze wet with vinegar, may be laid between the blister and the skin. But under no circumstances should a blister be left long upon children, as it may produce sores which are apt to take on an unhealthy action, and are difficult to heal.

Mustard (*sinapis nigra*) is frequently used, but seldom left on sufficiently long to produce blistering. Tincture of cantharides, croton oil, and strong liquor ammoniæ, tartar emetic ointment, and many others, are used in practice.

If the occasion for the blister passes off, the vesicles should be pricked, and their fluid contents allowed to trickle away, the vesicated surface being then dressed with some cold cream or lard. But if it should appear desirable to promote a discharge from the skin, the raised cuticles may be snipped off, and the blister either applied again at intervals, or some stimulating ointment as the savine (*juniperus sabina*) made use of. Great cleanliness should be observed in dressing the part.

Of late years, B. have been much used for the dispersion of glandular tumors, and are also applied over the surfaces of indolent ulcers, with the view of increasing the vascularity of the part. For old diseases of joints, B. ought to be placed at a little distance from the affected joint.

BLOCH, MARCUS ELIESER, a celebrated ichthyologist, b. of poor Jewish parents, at Anspach, in Bavaria, 1723. He was allowed to grow up in extreme ignorance. At 19, he had read nothing except a few useless rabbinical treatises. About that age, however, he became assistant to a Jewish surgeon at Hamburg, where he took the opportunity of learning German and Latin. A slight knowledge which he had acquired of anatomy inspired him with an extraordinary desire to study that science thoroughly. For this purpose he went to Berlin, and devoted himself to it and other branches of natural history with indefatigable zeal. He took the degree of doctor of medicine at Frankfort-on-the-Oder; and returned to Berlin to practice his profession, where he died 6th Aug., 1799. His great work is the *Allgemeine Naturgeschichte der Fische* (12 vols., Berlin, 1782–95, with 432 colored plates), long the most comprehensive work on ichthyology, and still valuable especially for its pictures. His *Systema ichthyologiæ iconibus CX illustratum*, which was left in an unfinished state, was published by Schneider (Berlin, 1801). After his death, his collection of fishes was purchased by government, and forms a part of the Berlin zoological museum.

BLOCK, in the rigging of a ship, is an important part of the apparatus necessary for raising sails and yards, tightening ropes, etc. The B. comprises both the frame or shell, and the pulley or pulleys contained within it. In seamen's language, a *tackle* includes the rope as well as the B. through which it works. The uses of blocks are very numerous on shipboard; and to subserve these uses, they are distributed about the masts, yards, sails, and ropes. They vary greatly in size, shape, power, and designation; but nearly every B. comprises a *shell* or wooden exterior, a *sheave* or wheel on which the rope runs, a *pin* or *axle* on which the sheave turns, and a *strap* (of rope or iron) to fasten the B. to any particular station (see PULLEY). A single B. contains only one sheave; a double B., two; and so on. Besides the designations of blocks according to the number of sheaves they contain (*single, double, treble, fourfold*), ships' blocks receive numerous other names—such as *bee-B., cut-B., cheek-B., clew-garnet B., clew-line B.*, etc. Some of these names depend on the kind of service, others on the place of fixing; while the rest are examples of the odd nomenclature adopted by seamen.

Block-making.—Ships' blocks were made by hand until about a century ago. But mere workers in wood could not produce them; it required unusual skill and practice to fashion the several pieces, and put them together so as to possess the requisite strength and facility in working. The trade was either carried on alone, or in conjunction with mast-making. More than 1400 such blocks were required for one of the old 74's, and a proportionate number of vessels for larger or smaller size. In 1781, a Mr. Taylor began to make the sheaves and shells of blocks by a process which he had invented. He made all the blocks for the royal navy until the expiration of his patent rights. The admiralty then commenced the manufacture on their own account. In 1801, Mr. (afterwards Sir) Mark Isambard Brunel submitted to the admiralty a working-model of a very beautiful system of machinery for block-making; it was accepted, and the inventor engaged to set up the apparatus at Portsmouth. So intricate was the machinery, and so great the difficulty in procuring the several working-parts from the machinists of those days, that it was not until the year 1808 that the system was put into effective operation. It was then, however, so perfect that very few additions or improvements have since been needed. The machinery made blocks more accurately than they had ever been made by hand, and with the aid of ordinary workmen only. It could effect £50,000 worth of work in a year, or 140,000 blocks, by the assistance of 10 men attending the machine. Duplicate machinery was made for Chatham. Brunel received £20,000 for his invention

and for his personal superintendence until the machinery was brought into working-order; this sum was money well laid out, for the machine saved to the country more than £20,000 a year, in the busy warlike period from 1808 to 1815. The machinery itself is too complicated to be described except at a length incompatible with the limits of this work; but it may be stated in a general way, that the system is made up chiefly of saws and lathes, combined with great ingenuity. The blocks are made of elm, and the sheaves of lignum vitæ; the pins are of iron, carefully prepared to avoid friction as much as possible.

BLOCKADE, in military tactics, is an operation for capturing an enemy's town or fortress, without a bombardment or regular siege. The attacking party throws up works on the neighboring heights and roads; these works may be redoubts, for 200 or 300 men each, raised around at distances of 1000 or 1500 yards asunder; or they may assume other forms, according to the circumstances of each case. The rest of the besieging force remains under cover in villages, or in a temporary camp, ready to repel any sortie attempted by the besieged. The whole purpose in view is to prevent the besieged from receiving supplies of any kind, in order that, when the food or the ammunition is exhausted, they may be compelled to surrender. Fortresses situated on steep and rocky eminences, difficult to conquer by bombardment or assault, may often be reduced by B.; because the roads or paths for the reception of supplies are few, and can be watched by a small number of troops. Towns situated on a plain are less frequently invested. If the inhabitants be numerous and commercial, they will soon be impatient of the restraint produced by a B., and may compel or induce the governor to adopt a plan opposed to his wishes as a soldier. If, however, a resistance be determined on, the governor sends out of the town as many non-combatants as possible; all the stores are collected in bomb-proof receptacles; economy is observed in the consumption of food; all the people within the walls are placed under military rules; and the governor endeavors, by frequent sorties, to prevent the besiegers from making too close an investment of the place.

Blockading, in a naval sense, is the prevention of the entrance or exit of the enemy's ships at a particular port. It is sometimes resorted to as an auxiliary to military operations by land; but generally is limited to a maritime investment.

BLOCK, Moritz, b. 1816; a German political economist, naturalized in France. After service in the statistical work of the ministry of agriculture, commerce, and public works, he devoted himself to authorship and published works on agriculture in various countries of Europe, on French statistics and finances, on socialism in Germany, and began and continued for some years the *Annuaire de l'Administration Française*.

BLOCKADE, in international law, is the right, in time of war, of rendering intercourse with an enemy's port unlawful on the part of neutrals; and it is carried into effect by an armed force (ships of war), which blocks up and bars export or import to or from the place blockaded. This right is described by all writers on the law of nations as clear and incontrovertible, having its origin in the soundest principles of maritime jurisprudence, sanctioned by the practice of the best times. It is explained on the reasonable theory, that if a potentate or government lays siege to a place, or simply blockades it, such potentate or government has a right to prevent any other power, or representative or subject of such power, from entering, and to treat as an enemy any one who attempts to enter the blockaded place, or in any way assists the besieged, for such a person opposes the undertaking, and contributes to the miscarriage of it.

Lord Stowell laid it down that there are two sorts of B.—one by the simple fact only, the other by a notification accompanied with the fact. In the former case, when the fact ceases—otherwise than by accident or the shifting of the wind—there is immediately an end of the B.; but where the fact is accompanied by a public notification from the government of a belligerent country to neutral governments, the B. must be supposed to exist till it has been publicly repealed. This notification it is the duty of the belligerent country to make immediately. His lordship also explained that, on the question of B., three things must be proved: 1st, The existence of an actual B.; 2d, The knowledge of the party; and 3d, Some act of violation, either by going in or coming out with a cargo laden after the commencement of blockade. On this last point, the time of shipment is very material; for although it might be hard to refuse a neutral liberty to retire with a cargo already laden, and by that act already become neutral property, yet, after the commencement of a B., a neutral cannot be allowed to interfere in any way to assist the exportation of the property of the enemy. After the commencement of a B., a neutral is no longer at liberty to make any purchase in that port. But the most essential element is *actual* B., and this state of things can only be proved to the satisfaction of a court of justice by the ships stationed on the spot to maintain the B. using their force for that purpose. A B., therefore, is only to be considered as actually existing when there is a power to enforce it.

To be valid, a B. must be accompanied by actual investment of the place, and it may be more or less rigorous, either for the purpose of watching the operations of the enemy, or, on a more extended scale, to cut off all access of neutral vessels to that interdicted place, which is strictly and properly a B.; for the former is, in truth, no B. at all, as far as neutrals are concerned. But to be binding on neutrals, it ought to be shown that

they have knowledge or may be presumed to know of the B.; and this knowledge may arise in two ways—either by such a public and formal notification as we have already described, or by the notoriety of the fact. Yet it is at all times most convenient that the B. should be declared in a public and distinct manner, instead of being left to creep out from the consequences produced by it; and the effect of such notification to the neutral government is clearly to include all the individuals subject to the latter.

The breach of B. may be either by coming out of the blockaded port, or going in; such breach, however, may sometimes be excusable. It has been decided that intoxication on the part of the master of a ship will not be received as an excuse. That breach of B. subjects the property employed for that purpose to confiscation is an established rule of the law of nations, and is universally acknowledged by all civilized governments. The violation of B. by the master, however, affects the ship, but not the cargo, unless the cargo is the property of the same owner, or unless the owner of the cargo is cognizant of the intended violation.

On the proclamation of peace, or from any political or belligerent cause, the continuance of the investment may cease to be necessary, and the B. is then said to be *raised*. The blockading force then retires, and the port is open as before to all other nations.—See the law on the subject of this article extremely well stated in *A Manual of the Law of Maritime Warfare*, by William Hazlitt and Henry Philip Roche, barristers-at-law, 1854; see, also, ORDERS IN COUNCIL, BRITISH.

BLOCK BOOKS. See PRINTING, *ante*.

BLOCKHOUSE is to a temporary fortification what a tower is to one that is permanent. In a wooded country, it is easily and quickly made, and the enemy cannot readily bring guns to bear upon it; on flat open ground it is less useful. The B. is always a covered defense, unlike a battery; sometimes with only one story, sometimes with two, of which the lower forms a barrack for a few men. It is usually either rectangular or shaped like a Greek cross; the latter is preferred, as enabling the fronts of fire to flank each other. The defense is usually by musketry. If opposed to infantry only, single rows of trunks of trees, either upright or horizontal, make a very good B., loopholed at intervals of about 3 ft.; and if there be earth enough quickly obtainable, by digging a ditch or from any other source, to embank it all round and to cover the roof, it will bear a great deal of rough usage. If opposed to artillery, the B. requires to be formed with double rows of trunks three feet apart, with well-rammed earth between them. The American backwoodsmen build blockhouses with great quickness and efficiency; several of these, with a curtain or continuous wall of stockading, may be made to inclose a large space, capable of accommodating a great number of defenders, and of repelling a considerable hostile force. The base of a wind-mill, on a hill, has in European countries often formed a good blockhouse. A regular B. should have a ditch, not only to supply earth, but to keep the enemy from approaching near enough to fire the timber of the blockhouse. There must be, at least, 4 ft. of well-rammed earth on the roof, to resist the effect of artillery. Such a structure without a roof is not a B., it is simply a stockade.

BLOCK ISLAND, in the Atlantic, s. of Rhode Island, and n.e. of Long Island; about 8 m. long and 5 wide, constituting the town of New Shoreham, Newport co., R. I.; pop. '70, 1113. It attracts numerous summer visitors. There is a light-house on the n.w. extremity in 41° 13′ n. and 71° 34′ west.

BLOCK-PRINTING. See PRINTING.

BLOCKSBERG, the name given to various mountains and hills in Germany, but pre-eminently to the Brocken, the highest point of the Harz mountains, and, indeed, of the n. of Germany. According to the popular belief, it is the favorite haunt of the witches, where they celebrate the night of the 1st of May, *Walpurgisnacht* (see WALPURGA), with wild orgies. Almost all mountains thus haunted are known to have been famous places of sacrifice in the ages of paganism.

BLOCK-SHIP, is a ship of war too old or too slow in sailing to render efficient service in action out at sea, but useful as a defense in great ports and naval arsenals. Since war-steamers have almost superseded the old sailing men-of-war, the latter are of little service except as block-ships, or for training-ships. The number of block-ships in the British navy in 1859 was about ten.

BLOCK-SYSTEM. See *Signals*, under RAILWAYS.

BLOCK-TIN is an inferior variety of tin. When the metal is reduced from its ores, it is first poured into molds, and the ingots thus procured are heated to incipient fusion in a reverberatory furnace, when the pure tin first fuses, and is withdrawn; and the less pure tin which is left behind being melted at a higher temperature, is poured into molds and is known as block tin. See TIN.

BLODGET, LORIN, b. N. Y., 1823; student in physical sciences, and in 1851 an assistant in the Smithsonian institution, having charge of matters relating to climate and atmosphere. He shared in organizing the Pacific railroad surveys, and compiled in a volume the records of scientific observations at government military posts. In 1857, he issued *Climatology of the United States, and of the Temperate Latitudes of the North*

American Continent, a work highly praised by Humboldt. In 1863, he had charge of the statistical work of the treasury department, and has since been connected with the customs as appraiser at large.

BLODGET, SAMUEL, 1720–1807, an inventor, b. Mass. Under the colonial government he was judge of common pleas in New Hampshire. In 1783 he made machinery by which he saved a valuable cargo from a sunken vessel. His success prompted him to go to England, where he proposed to raise the *Royal George*, the British man-of-war that suddenly careened and sank off Spithead Aug. 29, 1782, Admiral Kempenfeldt and 600 other persons being lost. His proposition was not entertained, and he returned and began the manufacture of duck. In 1793, he began a canal around Amoskeag falls, but failed, and was imprisoned for debt. He believed that by strict temperance and care about exposure to the atmosphere any one might live 100 years; but he died at 87.

BLOEMFONTEIN, a t. in s. Africa, the capital of Orange Free State, 600 m. n.e. of cape Natal; pop. 1200; inhabited chiefly by Boers. There is considerable trade with Cape Colony and the Transvaal republic.

BLOIS, a t. of France, capital of the department of Loire-et-Cher, has a remarkably fine situation on the acclivity of a hill, and is built chiefly on the right bank of the Loire, over which there is here a good stone bridge. It is about 35 m. s.w. of Orleans, on the railway between that place and Tours. The houses, in the upper part of the town especially, are mean and ill-built, and the streets are crooked and narrow, but they are kept clean by water from the public fountains, which are supplied by a splendid aqueduct supposed to have been constructed by the Romans. B. has a handsome cathedral; but its chief glory is its old castle, which has been the scene of many interesting historical events. Louis XII was born in it, and under its roof Charles, duc d'Alençon, and Margaret of Anjou, and Henri IV. and Margaret of Valois were married. Here also were sometimes held the courts of François I., Henri II., Charles IX., and Henri III. Here also the duc de Guise and his brother were murdered, by order of Henri III., on the 23d Dec., 1588. Isabella, queen of Charles VI, here found a retreat; it served as a prison for Mary de' Medici; Catharine de' Medici died within its walls; and Maria Louisa here held her court in 1814, after Paris had capitulated. B. is a place of great antiquity. Stephen, who usurped the crown of England on the death of Henry I., was the son of one of the counts of B., by Adela the daughter of William the conqueror. B. is an archbishop's see, has a tribunal of commerce, a communal college, a public library of 20,000 vols., a botanic garden, etc., and manufactures of porcelain and gloves, with a trade in brandy, wine, and wood. Pop. '76, 18,188.

BLOMFIELD, CHARLES JAMES, bishop of London, a learned and influential prelate of the church of England, was b. in 1786, at Bury St. Edmund's, in Suffolk, where his father was schoolmaster. Being well grounded by his father in the classics, B. went to Cambridge, where he took high honors. After he had filled several curacies, the bishop of London appointed him his chaplain, in recognition of his acknowledged philological and theological acquirements. Shortly after, he was called to the living of St. Botolph; in 1824, he was made bishop of Chester; and in 1828, he was promoted to the see of London, on the translation of bishop Howley to Canterbury. B.'s reputation for classical scholarship rests chiefly on his editions of *Callimachus* (Lond. 1815), and of several of the dramas of *Eschylus*. In connection with Rennel, he published the *Musæ Cantabrigienses;* and with Monk (1812), the *Posthumous Tracts of Porson;* and in 1814, the *Adversaria Porsoni*. He also published *Lectures on the Acts of the Apostles*. B. was exceedingly active in the superintendence of his diocese, and was a prime mover in the agitation for the erection of new churches. Under his presidency, more churches were erected in London than under any bishop since the reformation. His conduct in regard to the controversies that latterly agitated his diocese was much animadverted by both parties. He was accused at one time of leaning to Puseyism, and yet he proceeded against his clergy for alleged crypto-catholic practices. He died Aug., 1857.

BLOMMAERT, PHILIP, one of the most prominent of modern Flemish authors, was b. in 1809. In 1834, he published a volume of verse, characterized by much simplicity and earnestness, but so inartistic in form that it met with little success. He rendered better service to literature and to the patriotic cause by the publication (1836–41) of *Theophilus*, an old Flemish poem of the 14th c., and of the *Oudvlaemsche Gedichten* (old Flemish poems) of the 12th, 13th, and 14th centuries. Both works are enriched with glossaries and learned annotations. B. showed a predilection for middle-age literature generally, and translated the *Nibelungen* into Flemish iambics. His most important work is a history of the Belgians (Brussels, 1849), in which he attempts to show that the political destiny of the low countries has ever been identical with that of Germany, and that it is with the latter country, and not with France, she should seek to ally herself. B. also contributed extensively to several Belgian journals, especially to the *Messager des Sciences Historiques*. He died at Ghent, Aug. 14, 1871.

BLOND, JACQUES CHRISTOPHE LE, 1670–1741: a painter of Amsterdam, noted for miniature portraits. He conceived the idea of printing engravings in colors, and spent the most of his life in unsuccessful experiments, working in London and Paris, and

dying in a hospital in the latter city. Notwithstanding this ill-success, B. is regarded as the inventor of color-printing.

BLONDEL, a celebrated French minstrel of the 12th c., and the favorite of Richard the Lion-heart, king of England, whom he accompanied to Palestine. When Richard, on his return, was seized and imprisoned by Leopold, duke of Austria, B. (according to the exquisitely romantic myth of an old chronicler) resolved to find out the place in which his master was confined. He wandered through Germany in disguise, and at length coming to the castle of Löwenstein, in Austria, he heard that it contained some illustrious captive. Feeling assured that this was no other than the king, he tried all means to get a sight of him, but to no purpose. He then placed himself opposite to the tower in which he learned the unknown was imprisoned, and commenced singing one of those Provençal songs which Richard and he had composed together. Hardly had B. finished the first stanza, when a well-known voice from the tower took up the second, and carried it on to the end. So the minstrel discovered his monarch, and returning with all speed to England, was the means of his being ransomed by his subjects. Only a few of B.'s poems have come down to us; they are preserved in the Library of the Arsenal at Paris.

BLOOD, the nutritive fluid of the tissues, consists of a transparent colorless fluid, the *liquor sanguinis*, and minute solid bodies, the "corpuscles" which float in it. The liquor sanguinis consists of water, in which are dissolved fibrine, albumen, chlorides of sodium and potassium, phosphates of soda, lime, and magnesia, together with fatty and extractive matters, the latter the product of the metamorphosis of the tissues. The corpuscles are of two kinds—white and red; the white are larger and less numerous than the red, being in healthy blood in the proportion of 2 or 3 to 1000. In certain forms of disease the number of these white blood-corpuscles is increased. They present a granular appearance on the surface, have a nucleoleus, which is speedily brought into view by the action of dilute acetic acid, and are identical with the lymph-corpuscle. Under the microscope they vary their forms in the same way as the Amœba (see PROTEUS); hence these movements are called *amœboid*. The *red* corpuscles are peculiar to vertebrates, and seem to have their origin in the white corpuscles, are oval and nucleated in fishes, reptiles, and birds, but in man and the mammalia generally they are non-nucleated, and are biconcave flattened discs, their edges being thicker than the center, hence the dark appearance of the latter when seen under the microscope. They have a great tendency to turn on their side and run into rouleaux, like piles of coins. Their color is straw-yellow, and it is only when seen *en masse* that they give the blood its characteristic red color. The size of the human red blood-corpuscles is $\frac{1}{3200}$ of an inch. They are largest in reptiles, those of the Proteus (q.v.) being $\frac{1}{1000}$ of an inch in their long diameter. Hoppe Seyler has shown that, chemically, they consist chiefly of hemoglobin, with traces of albumen, cholestrin, protagen, phosphate of potash, but no fat. The specific gravity of B. is 1052 to 1057, and its *mean* quantity in an adult man about 34½ lbs. On evaporation as a whole, the B. yields 790 parts in 1000 of water, and 210 of solid residue, which residue has nearly the same ultimate chemical composition as that of flesh. When B. is set aside for a time, occasionally crystals consisting of globulin tinted with coloring matter appear. "The B. crystals of man and the carnivora have a prismatic form, whilst those of the rat and mouse are tetrahedral, and those of the squirrel hexagonal" (Carpenter).

Coagulation of the Blood.—When B. is drawn from the vessels, the liquor sanguinis separates into two parts—into fibrine, which becomes solid, and a pale yellowish colored liquid, *serum*. The fibrine coagulates, and in doing so entangles the corpuscles, and forms a red mass, the clot (*crassamentum*). Fibrine does not exist in the B. as such, but when it appears as a coagulum in the fluid, it is produced then and there by the union of two substances present in the blood, which separate as a solid matter (Schmidt)—the one, *globulin*, is contained in the blood-corpuscles; the other, *fibrinogen*, in the blood-plasma, the two uniting to form the fiber of the clot. The rapidity with which this change takes place varies with circumstances. Moderate heat, and exposure to the air, favor it; cold and exclusion from the air retard it. The B. remains fluid in the veins for some time after death. In glanders and some forms of malignant fever, and where the B. is *poor*, as in scurvy, it may remain fluid. The size and firmness of the clot depends on the amount of fibrine in the B., which in health averages about 2 parts in 1000. In inflammations it is much increased, and the B. forms slowly into a tough clot, which is almost destitute of red globules on its surface, and drawn in towards the center. This colorless layer is termed the *buffy coat*, and the physicians of bygone times used to attach great importance to it, believing that it was a phenomenon peculiar to inflammation, and bled repeatedly, with the view to its removal; whereas anything which delays coagulation, great poverty of B., as in chlorosis (q.v.), or any condition in which the fibrine is in greater proportion than the red blood globules, will cause this appearance; the clot of the impoverished blood will, however, be small and loose, and floating in an excessive quantity of serum. The color of the B. varies. In the arteries it is of a bright-scarlet color, while in the veins it is of a dark-purple color. The chief difference between arterial and venous blood is that the former contains more oxygen and less carbonic acid than the latter. See CIRCULATION OF THE BLOOD. This change

probably arises from the oxygen contracting the corpuscles, and altering their reflecting surfaces; carbonic acid, on the other hand, rendering them thinner and more flaccid. The changes in color can be effected in B. drawn out of the body by the application of the gases mentioned.

The red blood-corpuscles possess great powers of absorbing oxygen. They receive oxygen in the lungs, where they become colored, and carry it all over the body to the tissues to form new combinations. After a time, the corpuscles become dissolved in the liquor sanguinis, which fluid they serve to elaborate. The products of the metamorphosis of the tissues are poured into the B., so that it is really a very complex fluid. See RESPIRATION.

BLOOD, AVENGER OF. In the early ages of society, the infliction of the penalty of death for murder did not take place by the action of any tribunal or public authorities administering law, but, in accordance with the rude social condition, was left to the nearest relative of the murdered, whose recognized duty was to pursue and slay the murderer. He was called the avenger of B., in Hebrew, *Goël*, which term, however, was of much wider signification. The Mosaic law (Numb. xxxv.) did not set aside this universal institution of primitive society, but placed it under regulations, prohibiting the commutation of the penalty of death for money, which appears to have become frequent, and appointing *cities of refuge* for the manslayer who was not really a murderer. See CITY OF REFUGE. The Koran sanctions the avenging of B. by the nearest kinsman, but also sanctions the pecuniary commutation for murder. The primitive institution or custom subsists in full force among the Arabs at this day. Many of the hereditary feuds of families, clans, and tribes in all barbarous and semi-barbarous countries, have always been connected with the avenging of blood.

BLOOD, CORRUPTION OF (in law). See TREASON.

BLOOD, EATING OF. The eating of B. was prohibited under the Old Testament dispensation, obviously for reasons connected with the use of animals in sacrifice. Christians, with a few exceptions, have always regarded the prohibition as having ceased with the reason for it; and the exhortation of the apostolic council of Jerusalem to the Gentile converts to abstain "from things strangled and from blood," to have been merely an application of the great law of Christian charity to the circumstances of a transition period, with reference to the prejudices of Jewish converts.

BLOOD, THOMAS, a most daring, unscrupulous, and successful adventurer, was b. in Ireland about 1628, and served there in the parliamentary army. After the restoration, he put himself at the head of an insurrectionary plot, which was to begin with the seizure of Dublin Castle, and of Ormond, the lord-lieutenant. On its timely discovery, he fled, while his chief accomplices were seized and executed. Escaping to Holland, he was received there with high consideration. He soon found his way back to England, to try what mischief might be brewed among the fifth-monarchy men. Finding no prospect of success, he repaired to Scotland, invited by the turbulent state of affairs, and was present at the fight of Pentland, Nov. 27, 1666. On the night of the 6th Dec., 1670, the duke of Ormond was seized, in his coach in St. James's street, by a gang of bravoes, tied on horseback behind one of them, and hurried away towards Tyburn. The timely approach of his attendants at the moment that he had succeeded in struggling with his riding-companion to the ground, probably saved him from hanging. The leader in this daring villainy was B., and so well had he contrived it, that he did not even incur suspicion. His next enterprise was still more wild and dangerous. On the 9th of May, 1671, disguised as a clergyman, and accompanied by his former accomplices, he entered the Tower with the determination to carry off the regalia of England. After nearly murdering the keeper of the jewels, he actually succeeded in carrying off the crown under his cloak, while one of his associates bore away the orb. They were immediately pursued, however, seized, and committed to the Tower jail. Now came a singular turn of fortune. At the instigation of Buckingham, who was accused of having hired B. to attack the duke of Ormond, king Charles visited the dauntless miscreant in prison, and, dreading the threat that there were hundreds of B.'s associates banded together by oath to avenge the death of any of the fraternity, pardoned him, took him to court, gave him an estate of £500 a year, and raised him so high in favor that for several years col. B. was an influential medium of royal patronage. This scandalous disregard of public decency was heightened by the fact, that the old jewel-keeper, who had risked his life in defense of his charge, applied in vain for payment of a small reward for his devotion. After the fall of the "cabal" ministry, B. became hostile to Buckingham, and for a scandalous charge against him was committed to prison. He was bailed out, and died in his own house in 1680.

BLOOD-BIRD of New South Wales, *Myzomela sanguinolenta*, a beautiful little species of honey-eater (q.v.), which receives its name from the rich scarlet color of the head, neck, breast, and back of the male. It inhabits thickets. A very similar species is found in Bengal.

BLOOD-FLOWER, *Hæmanthus*, a genus of bulbous-rooted plants, of the natural order *amaryllideæ* (q.v.), mostly natives of South Africa, some of which are among the prized

ornaments of British green houses. They take their name from the usual color of their flowers, which form a fine head or cluster, arising from a spathe of a number of leaves. The fruit is a berry, usually with three seeds. The leaves of the different species exhibit considerable diversity of form, in some almost linear, in others almost round; in some, also, they are erect, in others appressed to the ground. The bulbs of some of the finest species of B. being very slow to produce offshoots, a curious method of propagating them is resorted to by gardeners, which is occasionally practiced also with other bulbous-rooted plants, by cutting them across above the middle, upon which a number of young bulbs form around the outer edge.

The species of B. seem generally to possess poisonous properties. The inspissated juice of *H. toxicarius* is used by the natives of South Africa for poisoning their arrows.

BLOODHOUND, a variety of hound (q.v.) remarkable for its exquisite scent and for its great sagacity and perseverance in tracking any object to the pursuit of which it has been trained. It derives its name from its original common employment in the chase, either to track a wounded animal or to discover the lair of a beast of prey. It was also formerly called, both in England and Scotland, *sleut-hound* or *sleuth-hound*, from the Saxon *sleut*, the track of a deer. The B. was formerly common and much in use in Britain, as well as on the continent of Europe, but is now rare. The poetical histories of Bruce and Wallace describe these heroes as occasionally tracked by blood-hounds, when they were skulking from their enemies. The B. was at a later period much used to guide in the pursuit of cattle carried off in border raids; it has been frequently used for the pursuit of felons and of deer-stealers; and latterly, in America, for the capture of fugitive slaves, an employment of its powers which has contributed not a little to render its name odious to many philanthropists. Terrible ideas are also, probably, suggested by the name itself, although the B. is by no means a particularly ferocious kind of dog, and when employed in the pursuit of human beings, can be trained to detain them as prisoners without offering to injure them. The true B. is taller and also stronger in proportion and of more compact figure than a fox-hound, muscular and broad-chested, with large pendulous ears, large pendulous upper lips, and an expression of face which is variously described as "thoughtful," "noble," and "stern." The original color is said to have been a deep tan, clouded with black. The color appears to have been one of the chief distinctions between the B. and the talbot (q.v.), but it is not improbable that this name was originally common to all bloodhounds. Many interesting anecdotes are recorded of the perseverance and success of bloodhounds in following a track upon which they have been set, even when it has led them through much frequented roads.—The CUBAN B., which is much employed in the pursuit of felons and of fugitive slaves in Cuba, differs considerably from the true B. of Britain and of the continent of Europe, being more fierce and having more resemblance to the bull-dog, and probably a connection with that or some similar race. Many of these dogs were imported into Jamaica in 1796, to be employed in suppressing the maroon (q.v.) insurrection, but the terror occasioned by their arrival produced this effect without their actual employment. It was this kind of B. which was chiefly introduced into the former slave-states of North America.

BLOOD-MONEY, the compensation by a man-slayer to the next of kin of the man slain, securing the offender and his relatives against subsequent retaliation. It was common in Scandinavian and Teutonic countries until after the introduction of Christianity, and the amounts were fixed by law. It is still a custom among the Arabs. There it costs only one third as much to kill a woman as to kill a man; but if a woman slain be quick with a male child, the fine is that for a full man; if with a female child, it is the price of two women. The amount of blood-money ranges from $150 to ten times that amount. The term blood-money was given in English law to rewards earned by informers against notorious offenders; and it is still used there and in America for compensation obtained by criminals who betray their fellows in crime, or more generally for the reward gained by any act of treachery.

BLOOD OF OUR SAVIOR, was an order of knighthood in Mantua, instituted by duke Vincent Gonçaga in 1608, on the occasion of the marriage of his son with a daughter of the duke of Savoy. It consisted of 20 knights, the Mantuan dukes being sovereigns. The collar had threads of gold laid on fire, and interwoven with the words *Domine probasti*. To the collar were pendent two angels, supporting three drops of blood, and circumscribed with the motto *Nihil isto triste recepto*. The name originated in the belief that in St. Andrew's church, in Mantua, certain drops of our Savior's blood are kept as a relic.

BLOOD OF SAINT JANUARIUS. See JANUARIUS, SAINT.

BLOOD RAIN. Showers of reddish and grayish dust sometimes fall on vessels off the coast of Africa, and on the land in the s. of Europe; if accompanied with moisture, they form "blood rain," and in elevated regions, red snow. The dust consists chiefly of microscopic organisms, while the red color comes from oxide of iron. A shower which fell at Lyons, Oct. 17, 1846, was estimated to bring 720,000 lbs. of matter, of which one eighth was organic. A shower described by Darwin covered more than 1,000,000 sq. miles. A shower in Italy, in 1803, furnished 49 species of organisms; one

in 1813, in Calabria, 64 species, of which 28 were common to the preceding. These phenomena date back even to the time of Homer. The organic particles are mostly diatoms and rhizopods; the whole number of species determined is more than 300, of which 15 are South American, and none African.

The zone of the earth in which these showers occur extends on both sides of the Mediterranean westwardly over the Atlantic, and eastwardly to central Asia. The origin of the dust is not yet ascertained; there is little ground for thinking it extra-terrestrial, especially as the region affected is so limited.

BLOOD STAINS, as determined by modern science, have risen to importance in some criminal trials, where attempts have been made with some success to determine, by microscopic and chemical tests, whether the stains in question were made by the blood of a human being or of some other animal; and even the further question is proposed—was the stain made by the blood of a man, woman, or child? and if by that of a man, can we tell if it was the blood of one or of another man? With proper chemical solvents it seems easy to determine that a stain is or is not made from blood. If of blood, then the microscope indicates, by the measurements of the corpuscles of which the blood was composed, whether it was human blood. It is asserted as the result of careful examinations that the blood of a man has larger red corpuscles than that of any other animal. The mean diameter of these red corpuscles expressed in ten thousandths of an inch is thus stated: Man, 77; dog, 70; rabbit, 65; rat, 64; pig, 62; mouse, 61; ox, 58; horse, 57; cat, 56; sheep, 44. In fresh blood these measurements may, perhaps, be depended upon; but when the blood has been dried the corpuscles change their form, and it would probably be impossible to determine whether the stain were from human blood or not. As for determining the blood of one person from that of another, there does not seem to be any possibility of doing so; indeed, so far as experiment has gone, it appears that there may be more difference in the corpuscles of the same man's blood, taken at different times or from different parts, than between the corpuscles of the blood of different persons. The examination of stains has been a prominent feature in some recent trials for murder, but it does not appear that any considerable dependence has been placed upon the testimony of experts, partly because scientific testimony of such a nature is difficult to comprehend, and partly because experts themselves of equal attainments differ widely in their conclusions.

BLOOD-ROOT. See GEUM, HÆMODORACEÆ, and SANGUINARIA.

BLOODSTONE. See HELIOTROPE.

BLOOM, an appearance on paintings resembling in some measure the bloom on certain kinds of fruit, such as peaches, plums, etc. (hence the name), produced, in all probability, by the presence of moisture in the varnish, or on the surface of the painting when the varnish is laid on. The B. destroys the transparency, and is consequently very injurious to the general effect of a picture. It is best prevented by carefully drying the picture and heating the varnish before applying it; and best removed by a sponge dipped in hot camphene, after which a soft brush should be employed to smooth the surface of the picture, which should be finally placed in the sunshine to dry.

BLOOM'ARY, or BLO'MARY, a furnace for transforming pig-iron to wrought or malleable iron, or for making such iron directly from ore. When ore is used, a mass of iron called a "bloom" is produced, instead of the impure pig-iron that runs from the melted metal in a blast-furnace. The B. process is one of the oldest in iron-working, and is used in rude forms in some still barbarous countries. The best of modern bloomaries are the German and the Catalan (Spanish) furnaces, in which ores are reduced chiefly by means of charcoal. The best of ore should be used, as the waste is much greater in poor ore. In the Catalan the charcoal, with a large part of the iron, is heaped on a square hearth opposite to the tuyere, charcoal and fine ore being added from time to time, while a moderate blast is kept up and the mass occasionally stirred. In about six hours the iron settles to the bottom, is taken out in a mass, and forged into a bloom. For the German or more common bloom, the ore is pounded fine and thrown in small quantities upon a charcoal fire, with either hot or cold blast, hot being much the best. The metal settles to the bottom, and is drawn off at intervals, and hammered into "blooms." The process is available in places where wood (for charcoal) and good iron ore are found near each other. Iron so made is of the best quality, and is very desirable for converting into steel.

BLOOMERISM, a new and fanciful fashion of ladies' dress, partly resembling male attire, which arose out of what is termed the "woman's rights' movement," that began to be agitated in the United States about the year 1848. The first woman's rights' convention was held at Worcester, Mass., in 1850, under the presidency of Mrs. Lucretia Mott. Its object was to advocate for women a more liberal education, training in trades and professions, and generally the social and political privileges possessed by the other sex. At the same date, and in close connection with this movement, arose an agitation for the reform of female attire. Its advocates said, justly enough, that if women were to take their place in the world as fellow-workers with men, they ought not to labor under the disadvantage of having a dress that deprived them of the use of their hands, and required nearly their whole muscular power for its support. In 1849, Mrs. Ann

Bloomer adopted the costume to which she has given her name, and lectured in New York and elsewhere on its advantages. The Bloomer dress consisted of a jacket with close sleeves, a skirt falling a little below the knee, and a pair of Turkish trowsers. Though a few ladies followed the example of Mrs. Bloomer, the dress was extremely unpopular, and exposed its adherents to a degree of social martyrdom which the more prudent, timid, or amiable declined to brave. A very elegant modification of the Bloomer dress was achieved by a New York lady—a Polish jacket, trimmed with fur, and a skirt reaching to within a few inches of the ground, avoiding a display of pantaloon, and showing off merely the trim furred boot, but still sufficiently short to avoid contact with the street; the filthy habit of spitting, which prevails in America, rendering such avoidance peculiarly necessary. The agitation for dress-reform has not died out on the other side the Atlantic. There appeared in New York a monthly publication, called the *Sibyl*, devoted to its advocacy, and whose editor, a married lady, as well as several of her contributors, personally illustrated their principles. A wood-cut at the head of the periodical represented the reform dress, as it was called. It looked by no means tempting in point of elegance—a fault fatal to its general adoption. The skirt was immoderately short, and the jacket cut the figure awkwardly in two. The introduction of B. into England, soon after it had sprung up in America, was under such unfavorable auspices, that it failed to gain entrance into respectable society, and speedily disappeared. Still here, as in America, nothing is more frequently talked of, or desired with more apparent fervency, than a dress reform. For instance, the heavy hooped skirts prevalent some years ago, injurious to health, fatal to comfort, and liable to be equally dirty and ridiculous, were universally complained of; but the prejudice with which any innovation is sure to be met, long discouraged every attempt to introduce a reform.

BLOOMFIELD, a t. in Essex co., N. J., 4 m. n.n.w. of Newark, on the Morris canal, and the Newark, Bloomfield, and Montclair branch of the Delaware, Lackawanna, and Western railroad. It also has connection with Newark by horse-cars. Pop. about 6000. It is a manufacturing place, and the residence of many business men of New York and Newark. It was one of the earliest settlements in the state. The Presbyterian church has here a seminary for the education of German ministers. The town was named from gen. Joseph Bloomfield, a revolutionary officer, member of congress, and governor of New Jersey.

BLOOMFIELD, ROBERT, the author of *The Farmer's Boy*, and other pastoral pieces, b. 1766, at Honington, near Bury St. Edmund's, was the son of a poor tailor, who died leaving Robert an infant. His mother with difficulty subsisted by teaching a school, where B. learned to read. At the age of 11, he was hired to a farmer, but ultimately became a shoemaker in London, where he wrote his *Farmer's Boy* in a poor garret. It was published in 1800, had extraordinary popularity, and was translated into a number of languages. He subsequently published *Rural Tales, Wild Flowers*, and other pieces. Though efforts were made for him by persons of rank, his health broke down, and he died nearly insane, at Shefford, in Bedfordshire, in 1823.

BLOOMFIELD, SAMUEL THOMAS, D.D., 1790–1869; an English critic, educated at Cambridge, and rector at Bisbrooke, Rutland. He was the author of many critical, doctrinal, and exegetical annotations to the New Testament; translated Thucydides' *History of the Peloponnesian War;* and made English notes to the Greek edition of the New Testament, a work still widely used in England and America.

BLOOMINGTON, a thriving city of central Illinois, the co. seat of McLean co. It is an important railroad center, having connection with St. Louis, Chicago, and Jacksonville, by the Chicago and Alton; with Cairo and Dubuque by the Illinois Central; with Indianapolis and Peoria, by the Indianapolis, Bloomington and Western; and with Toledo, by a division of the Wabash railroad. Pop. '70, 14,190. Here are the large repair-shops of the Chicago and Alton road, employing 1000 men, foundries, furnaces, and coal-mines; and it is an important center of local and general trade. A court-house, lately built of Illinois marble, at a cost of $100,000, adorns a beautiful square in the heart of the city. It has well-organized public schools, a high-school, a Roman Catholic academy, the Major college for women, 2 daily and 5 weekly papers. Water works are supplied from a large well dug in the prairie. The Illinois Wesleyan university (Methodist Episcopal), founded here in 1853, had, in 1879, 10 professors and 180 students. Its president is W. H. H. Adams, D.D. At Normal, 2 m. n. of the city, at the junction of the Illinois Central and Chicago and Alton railroads, is the Northern Illinois normal university, also organized in 1857. It has an imposing edifice built at a cost of about $200,000; 14 professors and teachers; 435 students; with 235 pupils in the training schools. Its president is Edwin C. Hewett, LL.D., who succeeded Richard Edwards, LL.D., in 1875. Connected with this institution is the state laboratory of natural history, in charge of prof. S. A. Forbes.

BLOOMINGTON, the seat of justice of Monroe co., Ind., between the branches of White river, 60 m. s.s.w. of Indianapolis, on the Louisville, New Albany and Chicago railroad. Its people are engaged in manufactures, limestone quarrying, and farm productions. It is the seat of the Indiana university (q.v.), founded by the state in 1828.

BLOUNT, a co. in n. Alabama, on the upper waters of Black Warrior river; intersected by the South and North Alabama railroad; 900 sq.m.; pop. '70, 9945—682 colored.

The surface is mountainous, with large forests; productions agricultural. Co. seat, Blountsville.

BLOUNT, a co. in s.e. Tennessee, on the N. Carolina border, intersected by the Knoxville and Augusta railroad; bounded or intersected by the Tennessee, Holston, and Little rivers; 600 sq.m.; pop. '70, 14,237—1460 colored. It has a mountainous surface, and fertile soil, producing wheat, corn, oats, etc., and sorghum molasses. Iron ore, marble, and limestone are found. Co. seat, Marysville.

BLOUNT, WILLIAM, 1744–1800; a politician in North Carolina and Tennessee. He was one of the signers of the federal constitution, governor of the territory of Ohio, and one of the first U. S. senators from Tennessee. He was expelled from the senate on a charge of having conspired to surrender New Orleans to the English. He was afterwards chosen to the Tennessee senate, and made its presiding officer.

BLOUSE, a name borrowed from the French for that loose, sack-like over-garment which, as worn in England by wagoners and farm-laborers, is called a smock-frock. The English smock-frock is made of coarse and imperfectly bleached linen, and is ornamented, particularly on the breast and shoulders, with plaits and embroidery. In the s. of Scotland it is sometimes worn by butchers, and is then blue, as in Germany and France. In Germany, it is frequently tightened to the body by a belt, and is sometimes made of coarse woolen; but France is pre-eminently the country of blouses. There they are worn universally, not only by the country people, but also by the laboring-classes in towns, not excepting Paris; and so characteristic is this garment, that the French populace are often called the "blouses." The *white* B. is Sunday dress with the working-classes in France, and has also often served as a countersign among the leaders of sections in secret societies. A lighter and neater garment of the sort, usually made of fine but imperfectly bleached linen, and buttoning in front, which the English smock-frock and the original continental B. do not, is much worn by summer tourists.

BLOW-FLY, *Sarcophaga carnaria*, an insect of the order *diptera* (two-winged), (q.v.), and of the large family *muscides*, of which the common house-fly (q.v.), flesh-fly (q.v.), etc., are familiar examples. The blow-fly is very similar to these in its general appearance; its body is hairy, the expanse of its wings about one inch, the face silky and yellow, the thorax gray, with three black stripes, the abdomen of a shining blackish brown, which, in certain points of view, assumes a bluish tint, checkered with glittering yellowish spots. One of the distinguishing characters of the genus is, that the eyes are widely separate in both sexes. The species of this genus are not unfrequently ovoviviparous, the eggs being hatched within the body of the parent. The generic name (Gr. *sarx*, flesh; *phago*, to eat) is derived from the circumstance that the larvæ of most of the species feed upon the flesh either of dead or of living animals. The blow-fly is common in Britain on heaths, in gardens, etc., and its larvæ are to be found feeding upon meat, the carcasses of animals, sometimes upon living earthworms, and too frequently upon sheep, of which it is one of the most grievous pests, requiring the constant attention of the shepherd during most of the summer and autumn. Some districts are more infested with it than others; it is particularly troublesome in the fenny districts of England. Unless the maggots are removed, they eat into the skin, the sheep suffer great torment, and soon die. At first they may be removed by shaking them out of the wool, into which dry sand is then abundantly sprinkled; but if they are very numerous, a mercurial ointment or wash of corrosive sublimate is applied; and when the skin is much broken, the wool is clipped away, an ointment of tar and grease is used, and a cloth sewed over the part. Like many other insects, the blow-fly multiplies with excessive rapidity.

Another species of this genus, common in Britain, is *S. mortuorum*, so named from its frequenting burial-vaults and similar places. It is very similar to the blow-fly, but the abdomen is of a shining steel blue, and there is a reddish brown line down the forehead.

BLOWING-MACHINES. The earliest blowing-machine was, doubtless, some form of the common bellows, the idea of which is supposed to have been derived from the lungs. A very primitive form of this instrument is still in use in some eastern countries, consisting simply of the skin of some animal sewed into a rude bag with a valve and nozzle. The older forms of domestic bellows are all constructed on the same principle—viz., a chamber formed of two boards with flexible leather sides, having at one end a nozzle with a narrow mouth; and in the lower board, a valve of considerably larger area for the admission of air. When the bellows are distended by drawing the boards apart, air is sucked in by the valve, to replace the vacuum which would otherwise be formed; and then, when the boards are being closed, the valve, which only opens inwards, is shut by the compressed air; and the latter, having no other escape, is forced out at the nozzle.

The great fault of the common bellows is, that it gives a succession of puffs, and not a continuous blast. One remedy for this was to use two bellows, so that one was blowing while the other was filling; but it was afterwards found that the double-bellows secured a still more uniform blast. This machine is merely the common bellows with a third board of the same shape as the other two placed between them, so as to form two chambers instead of one. The middle board is fixed, and both it and the lower one

have valves placed in them opening inward. A weight on the lower board keeps the under chamber filled with air; and when this board is raised by a lever or otherwise, the air which it contains is forced into the upper chamber. The exit pipe is attached to the latter, and a weight is placed on the upper board sufficiently heavy to press the air out in a continuous stream, the continuity being maintained by the large quantity of air always present in the upper chamber, and the uniform pressure of the weight. Some times a spring is used instead of a weight to press out the air. Even with the double bellows, however, the constant refilling of the upper portion from the lower prevents the blast from being quite regular.

For such purposes as the supplying of a continuous stream of air to a flame for glass blowing or soldering, a very convenient form of apparatus has been constructed by Mr. P. Stevenson of Edinburgh. By means of the common bellows worked by a treadle, air is blown into the lower portion of a small cylinder containing a quantity of water, and having a diaphragm in the middle of the height, with a wide pipe reaching nearly to the bottom. When the apparatus is at rest, the water remains below the diaphragm; but when air is blown in, it gradually rises through the pipe. The water as it descends then presses out the air in a steady stream by the exit-pipe, as a valve prevents it returning to the bellows.

Bellows made entirely of wood except the nozzle, first made in Germany in the 16th c., are in use in some continental countries. They are usually of large size, and the contrivance consists in having two boxes, of which the sides of the upper inclose those of the lower, so that the former can move up and down on the latter without admitting air except by a valve, as in the common bellows, of which, in fact, they are only a modification.

The Chinese have a very simple form of bellows, which is not only interesting in itself, but also because its action is almost the same as the blowing-engine. It is merely a square chamber of wood, with a close-fitting piston, which, when drawn from the nozzle, opens the valves to admit air, and when pushed in the opposite direction, shuts these valves, and forces the air out by the nozzle.

For blowing a domestic fire in a chimney, the most effective contrivance is a metal screen to close the front of the aperture above the grate, so that the supply of air must all pass through the fire. This kind of blower, however, will only act when the fire is already producing as much heat as to cause a sensible draught up the chimney.

For smelting and refining furnaces, where a blast with a pressure of 3 or 4 lbs. per sq. in. is required, blowing engines of large size are usually employed. In our article IRON, this kind of engine is referred to, and a small figure of one given; but we shall here describe the blowing apparatus itself more in detail. A blowing-engine consists of a steam-engine, with the ordinary steam-cylinder at one end, and a blast-cylinder at the other end of the beam. Such, at least, is the construction preferred for the larger-sized engines; but sometimes a horizontal arrangement of the cylinders is adopted for those of smaller size. The blowing-cylinder is of cast iron, with an air-tight piston, which, as it ascends and descends with the motion of the engine, alternately inhales and expels the air at each end. To affect this, a series of valves are provided, and these are arranged as follows: Inlet valves are placed on the top of the cylinder, and also on three sides of the box, but on the fourth side of this box there are two outlet valves. These valves consist of numerous openings, against which leather flaps lie when they are shut. Valves of a similar nature are placed at the bottom of the cylinder. When the piston descends, it would create a vacuum in the upper portion of the cylinder, provided there were no openings in it; but the external air pressing on the inlet valves, opens them, and fills the space above the piston; at the same time, the outlet valves, which only open outwards, are tightly closed by the air pressing inwards from the pipe. Again, when the piston ascends, it compresses the air above it, and exactly reverses the action of the valves. The valves at the bottom of the cylinder work exactly in the same way, the inlet valves opening when the piston ascends, and shutting when it descends, thus compelling the inhaled air to pass into the pipe by the lower outlet valves. The air is conducted by the pipe into a receiver of large capacity, which serves to equalize the blast before it passes to the tuyeres.

A blast-engine at Shelton iron-works, of which the blowing cylinder is 8 ft. 4 in. in diameter, and has a 9-ft. stroke, working with 186 horse-power, and making 32 single strokes of the piston per minute, inhales 15,700 cubic feet of atmospheric air per minute; but this is compressed by the blowing-cylinder to a pressure of 3 lbs. per sq. in. above the atmosphere, which reduces the volume supplied by the cylinder to 13,088 cubic feet. Its volume, however, is largely increased again, when raised to the hot-blast temperature, before entering the furnace. Much valuable information respecting blowing-engines and blast apparatus will be found in Dr. Percy's large work on *Metallurgy*, vol. ii.

In the Catalan forges of Spain and the s. of France, there is a very ingenious water-blowing machine in use called a *Trompe;* but it can only be advantageously employed where a fall of a few yards of water is available. A strong wooden cistern, to act as a reservoir for the water; wooden pipes (generally two in number), through which it descends; and a wind-chest, to allow the air and water to separate, constitute the essential parts of the apparatus. It is put in operation by lifting the wedge with a lever; this

allows the water to rush down the pipe, and in doing so, it draws in air through sloping holes, called aspirators, at the throat of the pipe. A continuous current of water and air is thus supplied to the wind-chest, which is provided with an opening for the escape of the water, while the air passes out in a regular stream by the nozzle-pipe. The height from which the water falls determines the tension of the blast; but the height seldom exceeds 27 ft., which gives a pressure of from 1½ to 2 lbs. to the sq. inch. It is asserted that no other blowing-machine gives so equable a blast as the trompe, and it is the least costly of any; but it has the serious defect of supplying air more or less saturated with moisture. The theory of this singular machine has never been satisfactorily explained, although one or two able philosophers, who have specially studied the matter, incline to the belief that much of the air is carried down the pipe by becoming entangled in water. It is found that the separation of the air from the water is greatly promoted by allowing the falling current to impinge on a narrow platform.

The fan, or fanners (q.v.), as it is sometimes called, is another machine of great value for producing currents of air. It has long been in use as a winnowing-machine for agricultural purposes, and also for creating a blast to melt pig-iron in foundries. More recently, it has been employed instead of bellows in smithies, on account of its greater convenience and the steadier blast which it yields. A domestic bellows has even been introduced on the fan principle. The fan is also much used in the ventilation of buildings, ships, and mines. For the last, it is now considered preferable to the plan of furnace ventilation, especially where there are fiery seams of coal.

In its construction, the fan is like a wheel, having the arms tipped with vanes, instead of being joined by a rim. It is placed inside a chest—usually in an eccentric position—with openings on each side round the spindle for the admission of air. The motion is given by steam or other power; and as it revolves, the centrifugal action sucks in air at the center, draws it towards the tips of the vanes, and these impel it forward through the exit-pipe. Engineers differ as to the proportions which should be adopted for the fan, and as to the extent of spiral which the fan-case should have. For foundries and smithies where the pressure of the blast required is from 4 to 5 ozs. per square inch, the following have been found to suit very well in practice: the width of the vanes, as well as their length, made one fourth of the diameter of the fan; the inlet openings in the sides of the fan-chest, one half, and the degree of eccentricity, one tenth of this diameter. There is a segmental slide by which the opening into the delivery-pipe may be increased or diminished. For such purposes, fans vary from 3 to 6 feet in diameter, and they are entirely constructed of iron. Double fans have been introduced by Mr. Chaplin in England, and by M. Perrigault in France. In these, two simple fans are so disposed on one spindle that the blast produced by one passes in its compressed state through a tube to the other, which largely augments the working pressure. In Platt and Schiele's silent fan, the air enters by a central entrance at one side only, and is expelled from the case at the opposite side. The vanes are a peculiar shape, and describe what the inventor (Schiele) calls an anti-friction curve. It is said to be very efficient, and so also is another form of noiseless fan by Mr. George Lloyd, London.

For the use of the fan in ventilation, see that head. In some cases, fans are of large size; some also are of peculiar construction. Agricultural fans (see FANNERS) are not usually placed in an eccentric position in their cases, and only some kinds of ventilating fans are. One of the happiest applications of the fan has been to draw off and render harmless the fine steel dust in the operation of needle-grinding.

A modified form of the fan, called a *centrifugal disk*, patented by Mr. Rammell, was successfully employed by the Pneumatic Dispatch Company for the transmission of the mail-bags. An ingenious but simple ventilator is in use in the mines of the Harz for supplying fresh air. It consists of two long cylindrical vessels, one of which is so much smaller as, when inverted, to move up and down inside the other. The outer one is partly filled with water, and has a tube leading through the water down to the mine. The inner inverted cask, which has a valve opening inwards, is lifted and then pressed down, so forcing air through the tube.

The Messrs. Roots' blowing-machine is thus described: "A pair of horizontal shafts, geared together at both ends, traverse a case of the form of two semi-cylinders, separated by a rectangle equal in depth to the diameter of the semi-cylinders, and in width to the distance between the centers of the shafts. . . . These shafts carry a pair of solid arms, each having a section somewhat resembling a figure of eight, the action of which, as they revolve, takes the air in by an aperture at the bottom of the machine, and expels it with considerable pressure, if required, at the top."

For the purposes of ventilation, and also for expelling accumulations of hot air, dust, waste flyings, etc., in factories, a machine has been constructed by Mr. J. Howorth, Farnworth, Bolton, called a *revolving Archimedean screw-ventilator*. It consists of an Archimedean screw inclosed in a tube with proper means of lubrication. Its diameter is 30 in., and it is made to be set in motion by steam or other power, but it is also furnished with a hood, on the top of which there are curved vanes, which turn the screw by the action of the wind. Immediately beneath these, there is another series of lateral vanes for the escape of the hot air.

BLOW-PIPE, a small instrument used in the arts for soldering metals, and in analytical chemistry and mineralogy, for determining the nature of substances by the action

of an intense and continuous heat, its principle depending on the fact, that when a jet of air or oxygen is thrown into a flame, the rapidity of combustion is increased, while the effects are concentrated by diminishing the extent or space originally occupied by the flame.

The blow-pipe generally consists of a conical tube of metal, about 8 in. long, closed at the wider or lower end, but open at the narrow or upper end, which latter constitutes the mouthpiece, and is turned over to admit of the lips closing perfectly round it. Near the lower end, a small tube, fitted with a finely perforated nozzle, is inserted at right angles to the large tube, the space below being intended as a chamber for condensing the moisture of the breath. Through this nozzle, a fine current of air can be projected against the flame experimented with.

When a current of air from the blow-pipe is directed against a candle or gas-jet, the flame almost entirely loses its luminosity, owing to the perfect combustion of the gases evolved from the source of heat, and is projected in a lateral direction, as a long-pointed cone, consisting of three distinct parts. The first or central cone is of a dark-blue color, and there the combustion is complete from the excess of air thrown in from the small nozzle. The second cone, or that immediately surrounding the first, is somewhat luminous; and here the oxygen, being insufficient for the combustion of the carbon, any metallic oxide subjected to the action of this portion of the flame is deprived of its oxygen, and reduced to the condition of metal: for this reason the luminous cone is generally termed the *reducing flame* of the blow-pipe. Beyond the second cone, or where the flame comes freely in contact with the atmosphere, and abundance of oxygen is present to effect complete combustion of the gases, is a third, or pale yellow envelope, containing excess of atmospheric air at a very high temperature, so that a portion of metal, such as lead or copper, placed at this point, becomes rapidly converted into its oxide: this outer part of the flame is on this account called the *oxidizing flame* of the blow-pipe.

Substances under examination before the blow-pipe are generally supported either on wood-charcoal or platinum—the latter in the condition of wire or foil. In applying the blow-pipe test, the body to be examined is either heated alone, or along with some flux or fusible substance; in some cases, for the purpose of assisting in the reduction of metals from their ores and other compounds; in others, for the production of a transparent glassy bead, in which different colors can be readily observed. When heated alone, a loop of platinum wire, or a piece of charcoal, is generally employed as a support; the former when the color of the flame is to be regarded as the characteristic reaction, the latter when such effects as the oxidation or reduction of metallic substances are to be observed.

The following are exemplifications of the difference of color communicated to the flame by different substances: Salts of potash color, the flame *violet;* soda, *yellow;* lithia, *purplish red;* baryta, *yellowish green;* strontia, *carmine;* lime, *brick red;* compounds of phosphoric acid, boracic acid, and copper, *green.* The commonly occurring metallic oxides reducible by heating on charcoal alone in the inner flame of the blow-pipe are the oxides of zinc, silver, lead, copper, bismuth, and antimony; the principal ores not so reducible are the alkalies and alkaline earths, as also the oxides of iron, manganese, and chromium. The fluxes generally used in blow-pipe experiments are either carbonate of soda, borax (biborate of soda), or the ammonia-phosphate of soda, otherwise called *microcosmic salt* (q.v.). The carbonate of soda, when heated on platinum-wire in the oxidizing flame, forms with silica a *colorless glass;* with oxide of antimony, a *white bead,* etc. The following metals are reduced from their compounds when heated with carbonate of soda on charcoal in the inner flame of the blow-pipe, viz.: nickel, cobalt, iron, molybdenum, tungsten, copper, tin, silver, gold, and platinum. When compounds of zinc, lead, bismuth, arsenic, antimony, tellurium, and cadmium are similarly treated, these metals are also formed, but being volatile, they pass off in vapor at the high temperature to which they are exposed.

Borax, as a flux, is generally mixed with the substance under examination, and placed on platinum-wire. When thus heated in either of the flames, baryta, strontia, lime, magnesia, alumina, and silica, yield *colorless beads;* cobalt gives a *fine blue color;* copper, a *green;* etc. With microcosmic salt, the results obtained are generally similar to those with borax, and need not be specially mentioned, as the test is applied in the same way. The blow-pipe has been long used by goldsmiths and jewelers for soldering metals, and by glass-blowers in fusing and sealing glass-tubes, etc.; it has also been applied in qualitative analysis for many years, but more recently chemists (especially Plattner) have devoted their attention to its use, and have even employed it with great success in *quantitative* chemical analysis; the advantages being that only a very small quantity of material is required to operate upon, whilst the results may be obtained with great rapidity and considerable accuracy.

BLOW-PIPE AND ARROW, a kind of weapon much used by some of the Indian tribes of South America, both in war and for killing game. It consists of a long straight tube, in which a small poisoned arrow is placed, and forcibly expelled by the breath. The tube or blow-pipe, called *gravatána pocuna,* etc., is 8 by 12 ft. long, the bore not generally large enough to admit the little-finger. It is made of reed or of the stem of a small palm. Near Pará, it is in general very ingeniously and nicely made of two stems of a palm (*iriartea setigera,* see IRIARTEA) of different diameters, the one fitted into the other,

in order the better to secure its perfect straightness. A *sight* is affixed to it near the end. The arrows used in that district are 15 to 18 in. long, made of the spines of another palm, sharply pointed, notched so as to break off in the wound, and their points covered with *curari* (q.v.) poison. A little soft down of the silk-cotton tree (q.v.) is twisted round each arrow, so as exactly to fit the tube. In Peru, arrows of only 1½ to 2 in. long are used, and a different kind of poison seems to be employed. An accidental wound from one of these poisoned arrows not unfrequently proves fatal. In the hand of a practiced Indian, the blow-pipe and arrow is a very deadly weapon, and particularly when directed against birds sitting in the tops of high trees. As his weapon makes no noise, the hunter often empties his quiver before he gathers up the game, and does more execution than an English sportsman could with his double-barreled fowling-piece.

BLUBBER. See CETACEA, WHALE, and WHALE-FISHERY.

BLÜCHER, GEBHARD LEBERECHT VON, prince of Wahlstadt, field-marshal of Prussia, was b. at Rostock, in Mecklenburg-Schwerin, West Germany, 16th Dec., 1742. At the commencement of the seven years' war, he joined a regiment of Swedish hussars, and in his first action was taken prisoner by the Prussian hussars, whose col. persuaded him to exchange out of the service of Sweden into that of Prussia, and gave him a lieutenancy. A lieut., Jägersfeld, having been promoted over B.'s head, he immediately wrote to Frederick the Great as follows: "Von Jägersfeld, who has no merit except that of being son of the Markgraf of Schwedt, has been put over my head: I beg to request my discharge." The result was, that B. was put under arrest, and after repeated applications for discharge, he received from Frederick the curt intimation: "Capt. Blücher is at liberty to go to the devil!" B. went instead to his estate at Grossraddow, in Pomerania, and devoted himself to farming; but he soon tired of a bucolic life. In 1793, having returned to the army, he fought, as col. of hussars, against the French on the Rhine, evincing great genius as a leader of cavalry. The breaking out of the war of 1806 led him, as lieut.-gen., to the battle of Auerstadt. B., with the greater part of the cavalry, occupied the left flank of the prince of Hohenlohe in the retreat of Pomerania. He is accused, on this occasion, of not giving the prince due support, and thus leading to the capitulation at Prenzlau. B. himself then marched into the territory of the free town of Lübeck, and hastily fortified the city; but the French took it by storm, and B. was forced to surrender at Ratkow, near Lübeck, whither he had escaped with a few troops. A fortnight after, he was exchanged for the French gen., Victor; and immediately on his arrival in Königsburg, was sent, at the head of a corps, by sea, to Swedish Pomerania, to assist in the defense of Stralsund. After the peace of Tilsit, he was employed in the war-department in Königsburg and Berlin, and subsequently became commander in Pomerania. At a later period, he was pensioned, along with several other men of note, at the instance, it is said, of Napoleon. He was one of the few to combat the general belief in the invincibility of Napoleon, which had grown into a sort of fatalism in high places. In common with Stein and Hardenberg, he labored to remove all weak and unpatriotic counselors from the person of the king. When all the leaders of the army lost courage, his constancy revived confidence, and made him the center of all hope for the future. When the Prussians at last rose in opposition to France, B. was appointed to the chief command of the Prussians and of gen. Winzingerode's Russian corps. At the battles of Lützen, Bautzen, and Haynau, he displayed heroic courage. At the Katzbach, he defeated marshal Macdonald, and cleared Silesia of the enemy. In vain did Napoleon himself attempt to stop the "old captain of hussars," as he called him, in his victorious career. In the battle of Leipsic he won great advantage over marshal Marmont at Möckern, 16th Oct., 1813, and on the same day pressed on to the suburbs of Leipsic. On the 18th, in conjunction with the crown-prince of Sweden, he had a great share in the defeat of the French, and on the 19th his troops were the first to enter Leipsic. B., in opposition to the policy in Austria, continually pressed the taking of Paris as the real aim of the war. On the 1st of Jan., 1814, he crossed the Rhine, garrisoned Nancy on the 17th of the same month, and after winning the battle of La Rothière, pressed forward to Paris; but his scattered corps were routed by Napoleon, and he fought his way back to Chalons with great loss. On the 9th Mar., however, he defeated Napoleon at Laon; and at the end of the month, after being joined by Schwarzenberg and his corps, he again advanced towards Paris. The day at Montmartre crowned the brilliant deeds of this campaign, and, on the 31st Mar., B. entered the French capital. Frederick William III. created him prince of Wahlstadt, in remembrance of the victory at the Katzbach, and gave him an estate in Silesia. In England, whither he followed the allied sovereigns, he was received with an enthusiasm never before excited by a German. The university of Oxford conferred on him the degree of doctor of laws. After Napoleon's return in 1815, B. once more assumed the general command, and promptly led the army into the Netherlands. On the 16th June, 1815, he lost the battle of Ligny, in which he was personally in great danger, from his horse falling on him. The victory of the allies at the battle of Waterloo was completed by B.'s timely appearance on the field. B. ordered his Prussians to pursue the flying enemy, which they did the whole night. Declining the offered truce, B. marched again against Paris, and on the second taking of that city manifested a strong desire to retaliate on Paris the spoliation that other capitals had suffered at the hands of the French; but he was held in check by the

duke of Wellington. In order to reward B.'s services to Prussia and the common cause, Frederick William III. created a new order, the badge of which consisted of an iron cross surrounded by golden rays. On the 26th Aug., 1819, a colossal bronze statue was erected in his honor in his native town. B. died 12th Sept., 1819, after a short illness, at his estate of Krieblowitz, in Silesia. In Berlin, a statue twelve feet high, modeled by Rauch, and cast in bronze by Lequine and Reisinger, was erected to his memory, 18th June, 1826, and at Breslau another, also executed by Rauch, in 1827. In the beginning of the campaign of 1813, his characteristic activity and the style of his attacks gained him the nickname of "Marshal Forward" from the Russians; it soon became his title of honor throughout Germany. His tactics were always much the same: to attack the enemy impetuously, then to retreat when the resistance offered was too great for his troops to overcome; to form again at a little distance, and watch narrowly the movements of the enemy, and whenever an advantage offered itself, to charge with lightning speed, and throw him into disorder, make a few hundred prisoners, and retire ere the opposing force had recovered from its surprise. Such were his usual maneuvers. B., as a man and as a soldier, was rough and uncultivated, but energetic, open, and decided in character. His ardent enthusiasm for the liberation of Prussia and Germany from a foreign yoke, and his uncompromising pursuit of this noble aim, have justly rendered him a hero in the eyes of the German people. The old red uniform, and the old name of "Blücher's Hussars," were restored to the 5th regiment of hussars by Frederick William IV., on occasion of the centenary celebration of B.'s birthday.

BLUE, a color of which there are several varieties used in the arts, noted below. See also COLOR. Blue, or, as it is sometimes termed, *true blue,* was the favorite color of the Scottish Covenanters in the 17th century. When their army entered Aberdeen, says Spalding, there were few of them without a blue ribbon; this color being probably adopted in contradistinction to the red of the royal forces. At the battle of Bothwell bridge, the flag of the covenanting army was edged with blue. From these usages, blue seems to have become the partisan color of the whigs, but commonly in association with orange or yellow, in memory of the house of Orange and the revolution settlement. This combination of blue and yellow is seen in the liveries of certain whig families of distinction, and also in the cover of the *Edinburgh Review.* Blue is the color of the uniform of the royal navy of England; it is of a dark tint, and is known as *navy blue.*

AZURE BLUE is a pigment prepared by mixing 2 parts of deep blue, 1 of oxide of zinc, and 4 of lead glass; the latter consisting of 4 parts of minium and 1 of sand. The above azure blue is for skies, but a pigment for more general use is prepared from 11 fused boraz and 67 gray flux; the latter being itself made from 89 pebble flux, 75 minium, and 25 sand.—BERLIN BLUE. See PRUSSIAN BLUE.—BRUNSWICK BLUE, or *celestial,* is made by precipitating the alumina from a solution of alum by carbonate of soda, washing the precipitate, and adding sulphate of baryta, sulphate of iron, yellow prussiate of potash, and some bichromate of potash. When dried, this mixture is known as Brunswick blue, but when the sulphate of baryta is left out, and the material not dried, it is called *damp blue.*—CERULEAN BLUE is a color used in pottery, and consists of 79 parts of gray flux, 7 carbonate of cobalt, 14 hydrated carbonate.—BLUE COLOR OF FLOWERS, or *anthocyan,* may be obtained from those petals of flowers which are blue by digesting them in spirits of wine in the dark. The color is soluble in alcohol, but is precipitated from its alcoholic solution by water. It is changed to red by acids, and to green by alkalies.—BLUE COPPERAS, or the sulphate of copper. See COPPER.—BLUE DYES. See INDIGO, LITMUS, PRUSSIAN BLUE, and DYEING.—IRON EARTH BLUE occurs native amongst bog iron ore and in mossy districts in Europe and New Zealand. It mainly consists of a phosphate of iron with a little alumina, silica, and water. It is called *native Prussian blue.*—INDIGO BLUE, in pottery-ware, consists of 13 parts of carbonate of cobalt, 26 hydrated carbonate of zinc, and 61 gray flux.—COBALT BLUE is the only really good and serviceable blue in the coloring of glass and porcelain, and is essentially the oxide of cobalt (CoO), the coloring part of which is so great, that the addition of $\frac{1}{1000}$ part to white glass is sufficient to render it blue. Several of the compounds named above owe their blue color to this substance. See COBALT.—DEEP BLUE is employed in porcelain coloring, and is made from 1 part of oxide of cobalt, 4 glass of lead (2 minium, 1 white sand), 1 lead glass (2 minium, 1 sand, 1 calcined borax), and 1 oxide of zinc, all of which are placed together in a porcelain crucible, fused for 2 or 3 hours; the residue washed, dried, and ground to a fine powder.—KING'S BLUE is made from 29 parts carbonate of cobalt, 29 sand, and 42 carbonate of potash, by fusing these ingredients in a crucible. The residue is intense deep blue, bordering on a black blue, and is generally reduced to powder, and re-fused with about half its weight of pebble flux (3 minium or litharge, and 1 sand).—MINERAL BLUE and PARIS BLUE. See PRUSSIAN BLUE.

PRUSSIAN BLUE is the deep blue color which is so frequently seen on cotton, muslin, and woolen handkerchiefs and dresses. It was discovered in the year 1710 by Diesbach, a color-maker in Berlin, and hence called *Berlin blue.* The mode of its manufacture was published in Britain, by Dr. Woodward, in 1724. It may be prepared in several ways: 1. By the addition of a solution of yellow prussiate of potash (ferrocyanide of potassium) to a solution of sulphate of iron (green vitriol). The blue compound thus produced deepens in tint when exposed to the air; and where it is required of greater consistence

or more *body*, some alum and carbonate of potash are added to the prussiate solution before mixing with the iron solution. 2. By mixing solutions of yellow prussiate of potash and perchloride of iron, which yields the variety known as *Paris blue*. 3. By adding a solution of the red prussiate of potash (ferrocyanide of potassium) to a solution of sulphate of iron, and this mode of preparation gives *Turnbull's blue*. The Prussian blue settles to the bottom of the mixing vessels, and may be collected and dried by exposure to the air, when it is obtained as a blue powder. If heat be applied during the drying, the material cakes, and when cut, exhibits a lustre and hue like copper. When alum has been used in its manufacture, the product has a dull earthy fracture. The composition of Prussian blue is that of a ferrocyanide of iron. See CYANOGEN. It is employed by washerwomen, under the name of *blue*, for neutralizing the yellow tint of cotton and linen clothes; by paper-makers, to color paper; and is very largely employed as a pigment in Calico-printing (q.v.) and Dyeing (q.v.). *Mineral blue* is formed when the Prussian blue is precipitated along with a solution of zinc or magnesia, or moist carbonates of zinc or magnesia are added during the precipitation of the color. In the formation of *royal blue*, a solution of tin is added, and *steam blue* is produced on the addition of solutions of tartaric acid and yellow prussiate of potash. The impurities liable to be present in Prussian blue are starch, chalk, and stucco, either of which necessarily decreases the intensity of the blue color, and the utility of the substance.

SAXONY BLUE is prepared by dissolving indigo (q.v.) in Nordhausen sulphuric acid, and was first manufactured in Saxony in the year 1810, by taking the very finely powdered indigo and incorporating it with the acid cautiously heated, when the indigo dissolves, and yields a blue color of great depth of tint. It is largely used in dyeing (q.v.). —OLD SEVRES BLUE is a cobalt blue used in pottery, and is made up of 19 parts oxide of cobalt, 39 dry carbonate of soda, 3 dry borax, and 39 sand.—THENARD'S BLUE is the blue formed by heating alum with a solution of cobalt, or it may be formed by igniting a mixture of phosphate or arseniate of cobalt with eight times its weight of alumina in the hydrated state procured by precipitation from alum by ammonia. Used in pottery.—TURQUOISE BLUE is composed of 3 of oxide of cobalt, 4 of alumina, and 1 oxide of zinc. It is manufactured by dissolving the oxides of zinc and cobalt in dilute sulphuric acid, adding the liquid to a solution of 40 parts of ammonia alum, drying up and igniting at a red heat for several hours. The addition of a little chromate of mercury gives it a geeen shade.—VARIEGATED BLUE is used for coloring porcelain, and is formed by fusing 10 oxide of cobalt, 9 oxide of zinc, 5 lead glass (2 minium, 1 sand, and 1 calcined bones), and 25 glass of lead (2 minium and 1 sand).

BLUE STONE, or BLUE VITRIOL, is sulphate of copper. See COPPER.

BLUEBEARD, the name given to the hero of a well-known tale of fiction, which is of French origin. According to this romance, the chevalier Raoul has a blue beard, from which he gets his designation. This personage tests his wife's curiosity by intrusting her, during his absence on a journey, with the key of a chamber, which she is forbidden to enter. She is unable to stand the test, and he puts her to death. Several wives share the same fate, but at length the seventh is rescued at the last moment by her brothers, and B. is slain. The tale appears in innumerable collections, under various forms. Tieck, in his *Phantasus*, has worked up this material into a clever drama, with numerous romantic and satirical additions, and Grétry has made use of it in his opera of *Raoul*.

The historic original of chevalier Raoul would appear to be one Giles de Laval, lord of Raiz, who was made marshal of France in 1429, and fought valiantly in defense of his country when invaded by the English; but his cruelty and wickedness seem to have eclipsed even his bravery, as he is remembered chiefly for his crimes, which credulous tradition has painted in the blackest and most fearful colors. He is said to have taken a pleasure, among other atrocities, in corrupting young persons of both sexes, and afterwards in murdering them for the sake of their blood, which he used in his diabolical incantations. Out of this fact, in itself probably half mythical, the main feature of the tale of B. has probably grown. Laval was burnt alive in a field near Nantes, in 1440, on account of some state crime against the duke of Brittany.

BLUE-BELL. See HYACINTH.

BLUE BIRD, BLUE WAR'BLER, BLUE RED'BREAST, or BLUE RO'BIN (*sylvia sialis*, or, according to the most recent ornithological systems, *erythaca* or *sialia Wilsoni;* see SYLVIADÆ), an American bird, which, from the confidence and familiarity it displays in approaching the habitations of men, and from its general manners, is much the same sort of favorite with all classes of people in the United States that the redbreast is in Britain. Except in the southern states, it is chiefly known as a summer bird of passage, appearing early, however, as a harbinger of spring, and visiting again "the box in the garden, or the hole in the old apple-tree, the cradle of some generations of ancestors." Few American farmers fail to provide a box for the B. B.'s nest. In size, the B B. rather exceeds the redbreast, which, however, it much resembles in general appearance. Its food is also similar The upper parts of the B. B. are of a rich sky-blue color, the throat and breast are reddish chestnut, and the belly white. The female is duller in colors than the male. The B B. lays five or six pale-blue eggs, and has two or three broods in the season. Its song is "a soft agreeable warble." The male is remarka-

bly attentive to his mate, and both exhibit extraordinary courage in driving away intruders from the vicinity of their nest. A hen, with her brood, has been seen to flee from the attacks of an enraged and pugnacious blue bird.—The B. B. is known as an inhabitant of the Bermudas, Mexico, the West Indies, Guiana, and Brazil.—In the western and in the more northern parts of North America, its place is taken by nearly allied and very similar species.

BLUE-BOOKS, the name popularly applied to the reports and other papers printed by parliament, because they are usually covered with blue paper. The term was, for like reasons, long applied to the reports sent annually by the governors of colonies to the colonial secretary; and even in technical official phraseology, these are called "blue-books." The practice of printing, and to some extent publishing, the proceedings of the house of commons, began in the year 1681, when disputes ran high on the question of excluding the duke of York from the succession to the throne. The proceedings on the occasion are extremely interesting. It was stated, that especially after parliaments were dissolved, false accounts of their proceedings were circulated, and, as a remedy, sir John Hotham moved that the votes and proceedings of the house be printed. Mr. Secretary Jenkins opposed the motion, saying: "Consider the gravity of this assembly: there is no great assembly in Christendom that does it; it is against the gravity of this assembly, and is a sort of appeal to the people." He was answered by Mr. Boscawen: "If you had been a privy council, then it were fit what you do should be kept secret, but your journal-books are open, and copies of your votes in every coffee-house, and if you print them not, half votes will be distributed to your prejudice. This printing is like plain Englishmen, who are not ashamed of what they do, and the people you represent will have a full account of what you do." Col. Mildmay said: "If our actions be nought, let the world judge of them; if they be good, let them have their virtue. It is fit that all Christendom should have notice of what you do, and posterity of what you have done—and I hope they will do as you do, therefore I am for printing the votes." The motion was carried. See *Parl. Hist.* iv. 1307; *Kennet*, iii. 396. The documents printed by the house of commons accumulated gradually in bulk and variety, until they reached their present extent. In 1836, the house adopted the practice of selling their papers at a cheap rate. A curious legal and constitutional question immediately arose out of this practice, a publisher having taken proceedings for libel against the officers concerned in circulating the papers, because it was stated in a report concerning prisons that the prisoners read indecent books printed by him. The chief contents of these papers at present are—the votes and proceedings of the house; the bills read in their several stages; the estimates for the public services of each year; the accounts of the expenditure of the moneys voted in the previous year; any correspondence or other documents which the ministry may voluntarily, or at the demand of the house produce, as connected with a question under discussion; reports of committees of inquiry appointed by the house; reports of commissions of inquiry appointed by the crown; and annual reports by the permanent commissions and other departments of the government, stating their proceedings during the year. The blue-books of a session, when collected and bound up, now often fill 50 or 60 thick folio volumes. Nothing can seem more hopelessly chaotic than those of a few sessions huddled together unarranged. It deserves to be known, however, that they are all printed according to a peculiar sequence, which enables the whole papers of a session to be bound up in such an order that any paper can be found by consulting an ample index in the last volume. In any library where the blue-books are preserved and properly bound up, the most trifling paper of any session may thus be found with ease; and it need hardly be said that with much that is useless or unimportant, there is an enormous mass of valuable matter hidden in the blue-books.

There is no doubt, however, that although the means are thus provided for finding what the blue-books contain, their contents are heterogeneous, and to a great extent cumbersome and valueless. They are not prepared on any uniform system, or subjected to general revision, or what may be called editing. Each officer prepares his own report in his own way, sometimes lauding his own services, or arguing in favor of his own peculiar principles on some public question, so that it has been remarked that the B. contain a large number of articles like those in the periodical press, but too cumbersome and dull to get admission there. It has been matter of complaint that the public are burdened with the expense of widely distributing such documents. It is stated in a treasury minute, circulated among the government departments in May, 1858, with the view of in some measure remedying the abuse, "that the cost of printing the report of the commissioners appointed to inquire into the endowed schools of Ireland, and the three volumes of evidence and appendices (including the cost of the paper), was £5200, and that the weight of the paper used in printing them was about 34 tons."

BLUE-BOTTLE FLY. See FLESH-FLY.

BLUE CARDINAL. See LOBELIA.

BLUE-COAT SCHOOL, the name ordinarily given to Christ's hospital, London, in which the boys wear blue coats or gowns, according to an old costume. See CHRIST'S HOSPITAL.

BLUE EARTH, a co. in s. Minnesota along the Minnesota river, reached or intersected by the Winona and St. Peter, the St. Paul and Sioux City, and the Minnesota and Northwestern railroads; 750 sq.m.; pop. '80, 22,889. The main business is agriculture. Co. seat, Mankato.

BLUE-EYE, *Entomyza cyanotis*, a beautiful little bird, abundant and very generally dispersed in New South Wales, although not found in the more southern Australian colonies. It is a species of honey-eater (q.v.) or honey-sucker, and is sometimes called the blue-cheeked honey-eater. The B. seeks its food almost exclusively among the blossoms and small leafy branches of *eucalypti*. Its food consists partly of insects and partly of honey; perhaps also of berries. It is a bold and spirited bird, of most elegant and graceful movements. Numbers are often seen together, clinging and hanging in every variety of position, frequently at the extreme ends of the small thickly-flowered branches, bending them down with their weight.

BLUEFIELDS, a river of the Mosquito territory, in Central America, which, after a course of several hundred m. to the e., enters the Caribbean sea in lat. 12° n., and long. 83° west. Its lower stream is navigable to a distance of 80 m. from the sea. At its mouth is a good harbor, above which stands a town of the same name, formerly the residence of the king of the Mosquito territory (q.v.).

BLUEFISH, *Temnodon saltator*, a fish of the family *scomberidæ*, of a genus having no detached finlets, no isolated dorsal spines, and no lateral armature of the tail, two dorsal fins, the first of which is small, and two deeply-hidden spines in front of the anal fin. The only known species is a native of the east coast both of North and South America. The upper parts are of a bluish color, the lower parts whitish, a large black spot at the base of the pectoral fins. The mouth is crowded with teeth, the jaws are furnished with large ones. The B. preys on other fishes, as the weak-fish, menhaden, and mackerel, the shoals of which it pursues. It is very swift, strong, and voracious. It sometimes attains a length of 3 ft., and a weight of 14 lbs. It is much esteemed for the table, and great numbers are brought to market in New York, Philadelphia, and other towns about the end of summer. It is often caught by trolling, as it bites readily at any object drawn swiftly through the water. It frequently ascends rivers even to fresh water.

BLUE-GOWNS, the name commonly given to a class of privileged mendicants in Scotland. The proper designation of these paupers was the king's bedesmen or beadsmen. In ancient times, a beadsman was a person employed to pray for another. See BEAD. From practices of this kind, there sprang up a custom in Scotland of appointing beadsmen with a small royal bounty, who ultimately degenerated into a class of authorized mendicants. Each of the beadsmen on his majesty's birthday received a gown or cloak of blue cloth, with a loaf of bread, a bottle of ale, and a leathern purse containing a penny for every year of the king's life. Every birthday, another beadsman was added to the number, as a penny was added to each man's purse. The most important part of the privilege was a large pewter badge, attached to the breast of the gown, which, besides the name of the bearer, had the inscription, *pass and repass*. This inferred the privilege of begging, and bespoke the kindly consideration of all to whom the beadsman appealed for an alms or a night's lodging. The fictitious character of Edie Ochiltree, in Sir Walter Scott's tale of the *Antiquary*, is a fair sample of this ancient and picturesque fraternity. The practice of appointing beadsmen was discontinued in 1833, at which time there were sixty on the roll. The whole have since died out. The last beadsman drew from the exchequer in Edinburgh his last allowance in May, 1863.

BLUE GRASS, or JUNE GRASS, *Poa pratensis*, a species common in this country and Europe, attaining its highest perfection in Kentucky, where a large region in the middle of the state is called the "blue-grass country," and is noted for its excellent cattle.

BLUEING OF METALS. See TEMPERING METALS, *ante*.

BLUE LAWS, a name given to certain enactments supposed to have been made by the New Haven colony, in Connecticut, in the early days of the settlement. These "laws" never existed; but as usual in the Puritan days the personal conduct of citizens was often subject to judicial supervision and animadversion, and Sabbath-breaking was especially odious to the magistracy. Currency was given to the idea of a code of severe and ridiculous enactments called the blue laws by the notorious tory minister, the Rev. Samuel A. Peters, who had charge of the English churches in Hartford and Hebron, but who was compelled by the revolution to fly to England. There, in 1781, he published his *General History of Connecticut*, a work whose exaggerations and spite make it almost a curiosity. Many years ago a small book containing these supposed laws, which were really extracts from Peters' history, was published, and is even now referred to as authority by some who have not investigated the subject.

BLUE LICK SPRINGS, a village in Nicholas co., Ky., on Licking river, 40 m. n.e. of Frankfort, noted for mineral waters, which are sent in bottles to many parts of the country. They contain lime, magnesia, soda, carbonic acid, sulphureted hydrogen, sulphates, and muriates.

BLUE-MANTLE, the title of an English pursuivant-at-arms. See PURSUIVANT.

BLUE MONDAY, so-called from a custom in Europe in the 16th c. of decorating churches in blue colors on the Monday preceding Lent, when the people had a holiday; but the excesses committed led to the legal abolition of the custom. In the United States women in some of the rural districts called every Monday by the name, as it is the general day for doing the hard laundry work of the week. In the city any Monday may be blue to workmen who on the day before spend their weekly wage unwisely.

BLUE MOUNTAINS, the name of two mountain chains, the one in New South Wales, the other in Jamaica.—1. The B. M. of New South Wales run very nearly parallel with the coast, and being impassable by nature, long threatened to cut off the maritime part of the colony from the interior. To cross this apparently insurmountable barrier was the grand aim of the colony during the first 24 years of its existence, surgeon Bass, the discoverer of the strait that bears his name, standing pre-eminent among the adventurous and patient explorers. It was not till 1813 that a practicable passage was found, or rather made, for it terminated towards the w. in a zigzag road down a nearly perpendicular height of 670 ft.; but it was not before 25th April, 1815, that gov. Macquarie, with a numerous retinue, actually opened a route into the Bathurst plains, then yielding the richest pasturage in the colony, and now forming its gold-field. The highest point of the B. M., Mt. Beemarang, is 4100 ft. high, and some parts of the road which crosses them are about 3400 ft. above the sea. A line of railway crosses the B. M., in the construction of which great engineering difficulties have been overcome, part of it being carried along the face of a precipitous mountain.—2. The still loftier range of the same name in Jamaica traverses the whole length of the island, and in some places attains an altitude of 7000 feet.

BLUE PETER, a blue flag with a white square in the center, used to signify that the ship on which it is raised, or the fleet of which that is the flagship, is about to sail. "Peter" is a barbarism for the French *partir*, a notice of departure.

BLUE PILL, *Pilula hydrargyri*, is the most simple form in which mercury can be administered internally. It consists merely of *two* parts of mercury rubbed up with three parts of conserve of roses, till globules of mercury can no longer be detected; to this is added powdered licorice-root, so that a pill of five grains contains one grain of mercury.

In cases of torpid condition of the liver or inflammation of that organ, B. P. is much used as a purgative, either alone or combined with some other drug, such as rhubarb. When it is given with the view of bringing the system under the influence of mercury (salivation, q.v.), small doses of opium should be added to counteract its purgative tendency, and the state of the gums watched carefully from day to day, so that the first symptoms of salivation may be noticed, and the medicine omitted. As a purgative, the common dose of B. P. is one or two pills of five grains each, followed by a purgative draught. When the system is to be saturated with it, or salivated, one pill may be given morning and evening, or one every night combined with $\frac{1}{4}$ of a grain of opium, repeated till the gums become sore. But the sensibility to the action of mercury varies with the individual; some may take large quantities before it exhibits its physiological symptoms, and on the other hand, three blue pills, one taken on three successive nights, have brought on a fatal salivation. When taking blue pills, all sudden changes of temperature should be avoided; and, indeed, though they are found in every domestic medicine-chest, neither they nor any other form of mercury should be given without good cause and without the greatest caution.

BLUE RIDGE, the most easterly range of the Alleghanies, in the United States. It forms an almost continuous chain from West Point in New York down to the n. of Alabama, through New Jersey, Pennsylvania, Virginia, the Carolinas, and Georgia. It divides Virginia into eastern and western. Mt. Mitchell, in North Carolina, the loftiest point of the B. R., is 6470 ft. above the sea; while the Otter peaks in Virginia, next in elevation, have an altitude of 4200 feet.

BLUE RIVER, in e. Indiana, running s.w. and forming the e. fork of White river. It affords abundant water-power to Newcastle, Shelbyville, and other manufacturing villages.

BLUE RIVER, or BAHR-EL-AZBAK. See NILE, *ante*.

BLUE STOCKING, a name given to learned and literary ladies, who display their acquirements in a vain and pedantic manner, to the neglect of womanly duties and graces. The name is derived from a literary society formed in London about the year 1780, which included both men and women. A gentleman of the name of Stillingfleet, who was in the habit of wearing blue stockings, was a distinguished member of this society; hence the name, which has been adopted both in Germany and France.

BLUETHROAT, or BLUEBREAST, also called bluethroated warbler and bluethroated robin (*phœnicura suecica*, or *sylvia suecica;* see SYLVIADÆ), a beautiful bird, a very little larger than a redbreast, and much resembling it, but having the throat and upper part of the neck of a brilliant sky-blue, with a spot in the center, which in some specimens is pure white, and in very old males is red. Below the blue color is a black bar, then a line of white, and again a broad band of bright chestnut. The B. is well known as a summer bird of passage in many parts of Europe, from the Mediterranean sea to the

Arctic ocean, but is very rare in Britain, only a few instances of its occurrence having been recorded. It is supposed to spend the winter in Africa. Great numbers are caught for the table in Lorraine and Alsace. The bird is one of those known by the names of *becfin* (q.v.) and *beccafico* (q.v.), and esteemed a delicacy. It is a bird of very sweet song. It imitates, to an unusual degree, the notes of other birds, so that the Laplanders give it a name which signifies a bird of a hundred tongues.

BLUE VITRIOL. See COPPER, *ante*.

BLUEWING, according to some naturalists, a genus of *anatidæ*, which has been named *cyanopterus* (by a sort of Greek translation of the English name), but more generally regarded as a mere section or subsection of the restricted but still large genus *anas*. See DUCK. The tail-feathers are only 14 in number, instead of 16, as in the common duck, teal, etc.; but the character from which the name is derived is, after all, that which chiefly distinguishes the bluewings, and never fails to arrest attention. The best known species, the common or lunate B. (*anas* or *cyanopterus discors*), is generally called the blue-winged teal in the United States of America, where it is very abundant. Vast numbers spend the winter in the extensive marshes near the mouths of the Mississippi, to which they congregate both from the north and from the coast regions of the east; but the summer migrations of the species extend as far n. as the 57th parallel, and it is plentiful on the Saskatchewan in the breeding season. It breeds, however, also in the marshes of the south, even in Texas; and is common in Jamaica, where it is supposed to be not a mere bird of passage, but a permanent resident. None of the duck tribe is in higher esteem for the table, and it has therefore been suggested that the B. is particularly worthy of domestication, of which it seems to be very easily susceptible. In size it is rather larger than the common teal; in the summer plumage of the male, the upper part of the head is black, the other parts of the head are of a deep purplish blue, except a half-moon shaped patch of pure white before each eye; the prevalent color of the rest of the plumage on the upper parts is brown mixed and glossed with green, except that the wings exhibit various shades of blue, the lesser wing-coverts being of a rich ultramarine blue, with an almost metallic luster; the lower parts are reddish orange spotted with black; the tail is brown, its feathers short and pointed.—The B. is a bird of extremely rapid and well-sustained flight. The flocks of the B. are sometimes so numerous and so closely crowded together on the muddy marshes near New Orleans, that Audubon mentions having seen 84 killed by the simultaneous discharge of the two barrels of a double-barreled gun.—There are other species of B., also American; but this alone seems to visit the more northern regions.

BLUM, ROBERT, was born in very humble circumstances at Cologne, 10th Nov., 1807. After a brief military service in 1830, he became scene-shifter, afterwards secretary and treasurer, to Ringelhardt, director of a theater at Cologne, and subsequently at Leipsic, in which situation he remained, devoting his leisure time to literature and politics until 1847, when he established himself as bookseller and publisher. In 1840, he founded at Leipsic the *Schillers-Verein*, i.e., Schiller's society, which celebrated the poet's anniversary, as a festival in honor of political liberty. In 1845, he acquired, in connection with the German Catholic movement and the political outbreaks in Leipsic, great reputation as a popular orator; and in 1848, was elected vice-president of the provisional parliament at Frankfort, and as such he ruled that turbulent assembly by presence of mind and a stentorian voice. In the national assembly he became leader of the left; and was one of the bearers of a congratulatory address from the left to the people of Vienna, when they rose in October. At Vienna he joined the insurgents, was arrested, and shot on the 9th Nov. B. was a man of strong character, of great natural intelligence, and a speaker of stirring eloquence. For heading a party, he possessed cleverness and ambition enough, but he had not that passion and fanaticism which scorns to consider the consequences likely to flow from unbridled popular license. The news of his execution caused an indignant outcry among the democrats in Germany, who, besides instituting commemorations for the dead, made an ample subscription for his widow and children.

BLUMENBACH, JOHANN FRIEDRICH, a very eminent naturalist, was b. at Gotha, 11th May, 1752. He studied at Jena and Göttingen, in the latter of which universities he became extraordinary professor in 1776, and ordinary professor in 1778. Here he lectured for fifty years on natural history, comparative anatomy, physiology, and the history of medicine. In 1785, consequently before Cuvier, he made natural history dependent on comparative anatomy. His *Manual of Comparative Anatomy and Physiology* has been translated into almost all the principal languages of Europe. The natural history of man was always his favorite study; and his *Collectio Craniorum Diversarum Gentium*, commenced in 1791 and completed in 1808, gave to the learned world the result of his observations on the skulls of different races, of which he had an extensive collection (see ETHNOLOGY). He published many other works on natural history, all of which were favorably received; for, both as a writer and a lecturer, he was eminently successful. His *Manual of Natural History*, indeed, has gone through 12 editions. Towards the end of the 18th c., he visited England, where he met with a distinguished reception from the most famous naturalists. On the 19th Sept., 1825, his friends celebrated the jubilee of his doctorate, presented him on the occasion with a medal struck on purpose, and founded an exhibition in his name, the proceeds of which were to assist young

physicians and naturalists in the prosecution of their researches by travel In 1835, the increasing infirmities of age compelled him to resign his academical functions. He died on the 22d Jan., 1840.

BLUNDERBUSS is a kind of short musket with a very wide bore, sufficient to take in several shot or bullets at once. It has a limited range, but is very destructive at close quarters. As a military weapon, it is chiefly of service in defending passages, doorways, staircases, etc. Some of the English and German troopers in the 17th c. were armed with the B ; but the carbine has since nearly superseded this weapon.

BLUNT, EDMUND, 1799–1866; b. Mass.; son of Edmund March; hydrographer and marine surveyor, engaged on his own account on the United States coast and in the West Indies, and appointed first assistant in the government coast survey. He introduced the use of the Fresnel light in American light-houses.

BLUNT, EDMUND MARCH, 1770–1862; b. N. H.; author of the *American Coast Pilot*, a most useful work for navigators, which has passed through nearly 30 editions, and been translated into several other languages. He published many other nautical works, charts, etc.

BLUNT, JAMES G., b. Maine, 1826; brig.gen. commanding the department of Kansas during the civil war. He was made a maj.gen. in 1862.

BLUNT, JOHN JAMES, 1794–1855; an English clergyman, author of *Vestiges of ancient Manners and Customs discoverable in Modern Italy and Sicily, Undesigned Coincidences in the Writings both of the Old and New Testaments an Argument of their Veracity, History of the Christian Church in the first three Centuries*, and *Sketches of the Reformation of the Church of England.*

BLUNTSCHLI, JOHANN KASPAR, b. Switzerland, 1808; a German jurist; graduated at Bonn in 1829. He was prof. in the university of Zurich, a member of the grand council of the local government, and strongly opposed the civil war of 1847–48. In 1848 he became prof. of German and international law at Munich, and in 1861 prof. of political science at Heidelberg. In 1864, with Baumgarten and others, he founded the Protestant union, and subsequently presided over several Protestant conventions, and over the general synod at Baden in 1867. He was in favor of a union between south and north Germany, and was elected to the customs parliament. B. is the author of many valuable works on politics, laws, and the sciences.

BLUSHING, a sudden reddening of the face, neck, and breast, owing to some mental shock, most commonly of the character of humiliation or shame. The nature and cause of this effect have been recently elucidated by physiological researches. It is produced by an increased flow of blood into the capillary vessels over the parts where the blush extends. Besides reddening the complexion, it creates a sensible augmentation of heat in those parts. The feeling that accompanies the state is of a distressing kind

The phenomenon of B. is part of a general influence exerted on the capillary circulation by mental causes operating through the brain. The experiments whereby the existence of this influence has been established, may be described as follows: The *small blood-vessels*, by which the blood is brought into proximity with the various tissues of the body, are kept in a state of balanced distension between two forces, the one the propulsive power of the heart's action, which fills and distends them; the other, an influence derived from the nervous centers, and acting upon the muscular fibers so as to contract the vessels. The first of the two forces—the agency of the heart—is quite well understood: it is simply like the case of distending the hose of a fire-engine by working the pump, and driving the water along. The counteracting force of the nerve-centers is proved by the following experiments: When the sympathetic nerve proceeding to the vessels of the head and face of an animal is cut, there follows congestion of the blood-vessels with augmented heat over the whole surface supplied by the nerve. The ear is seen to become redder; a thermometer inserted in the nostril shows an increase of temperature, the sign of a greater quantity of blood flowing into the capillaries. The inference from the experiment is that, from the withdrawal of a counterpoise, the force that *distends* the small blood-vessels—that is to say, the heart's action—has an unusual predominance. It is further proved that this nervous influence, acting upon the minute muscular fibers of the small vessels, proceeds from the nerve-centers lodged in the head, for, by cutting the connection between the brain and the ganglion in the neck, from which the above-mentioned nerve is derived, the same restraining influence is arrested, and the congestion takes place. By stimulating the divided nerve galvanically, the suffusion disappears, the vessels shrinking by the galvanic contraction of their muscular coats.

The agency now described is of a piece with the action of the brain upon involuntary muscles generally, as the heart and the intestinal canal, and by it many organic functions—digestion, nutrition, absorption, etc.—are affected by those changes in the cerebral substance that accompany mental states. It is known that mental excitement has an immediate influence in all those functions; one set of passions, such as fear, tend to derange them, while joy and exhilaration operate favorably upon them.

To apply these observations to the case in hand. Supposing a person in the average mental condition, and something to arise which gives a painful shock to the feelings—

a piece of ill news, a reproach from some one whose good opinion is much valued, an open shame, or the fear of it, a fit of remorse, an occasion of grief—the pain is accompanied with a sudden loss, or waste, or decrease of cerebral power; none of the functions that the brain aids in maintaining is so strongly stimulated as before; and in particular, that stream of nervous energy which balances the heart's action in regulating the distension of the small blood-vessels, is abated, the abatement being made apparent in the redness and heat over the face and neck. In a great stroke of mental depression, the influence is of a much more extensive kind, though still of the same nature essentially as regards the enfeeblement of the nervous energy, and may lower the action of the heart itself: in which case there will be a wide-spread pallor, perhaps without a blush. In all probability, it is when the loss of cerebral influence extends only to the relaxation of the muscular fibers of the small vessels, leaving the heart in its usual vigor, that the state of B. is most fully manifested. Hence it is more apt to arise out of the smaller modes of painful apprehension than from the more serious calamities that prostrate the system throughout.

It is said that, in the Circassian slave-market, a young woman that blushes fetches a higher price. Some complexions do not show the increased flow of blood in this way, and all persons are not equally sensitive to the cerebral shock that causes it.

BOA, in popular language, the name of all those large serpents which kill their prey by entwining themselves around it, and constricting it in their coils; but by zoologists of the present day, limited as the name of a genus to a very small portion of their number, all of which are natives of the warm parts of America—the similar large serpents of Asia and Africa forming the genus *python* (q.v.). The name B., however, was certainly not originally applied to American serpents, for it is used by Pliny, who accounts for its origin by a fable of serpents sucking the milk of cows, thus referring it, very improbably, to the Latin *bos,* an ox. The Linnæan genus B. comprehended all serpents having simple subcaudal plates, but without spur or rattle at the end of the tail, and was thus very artificial, as founded chiefly upon a single unimportant character, and consisted of a very miscellaneous assemblage of species, venomous and non-venomous. The B. family, or *boïdæ,* as now constituted (containing the *pythons,* etc., of the old world, as well as the true *boas* of the new), is almost exclusively confined to tropical climates, and all the species are of large size and great strength, some of them far exceeding in these respects all other serpents. The story related by the ancients of a serpent 120 ft. in length, which devoured several soldiers, and caused alarm to a Roman army in Africa, may perhaps be deemed unworthy of credit, although the skin is said to have been long preserved at Rome; but there is good reason to believe that serpents in more modern times have attained at least half this length, and have made even the larger mammalia, and sometimes man, their prey. The *boïdæ* are not venomous; but their mouth, although destitute of poison-fangs, is so furnished with teeth as to make their bite very severe. Their teeth are numerous, long, and directed backwards, so as the more effectually to prevent the escape of the prey, which is first seized by the mouth, and then the serpent, with a rapidity of motion which the eye of the closest observer fails perfectly to follow, coils itself around it; the powerful muscles of the body are afterwards brought into action to compress it, so that usually in a few minutes its life is extinct, and its bones are broken. Deglutition then takes place—not, as has been alleged, after the prey has been licked and covered with saliva by the tongue, but accompanied with an extraordinary flow of saliva, which seems not only to serve for lubrication, but to have the property of hastening the decomposition of animal substances, and so to assist in making the prey more easy to be swallowed. It is always swallowed entire, and the process is sometimes rather a tedious one, and seems to require no small muscular effort; but the muscles of the serpent are capable of acting for this purpose, even at the neck, when that usually narrowest part of the body is distended to an enormous degree as the prey passes through it. The lower jaw is not simply articulated to the skull, but by the intervention of other bones, a structure without which the prodigious dilatation of the throat would be impossible. The lungs consist of two lobes, one much larger than the other, and at the extremity of the larger is an extremely capacious air-bag, which is supposed to serve for the necessary aëration of the blood whilst respiration is impeded in the process of deglutition.

The tail in all the boïdæ has great prehensile power, and its grasp of a tree round which it may be coiled is aided by the opposing action of two claws, one on each side of the anus, which are really the representatives of the hinder limbs of the superior vertebrate animals, and which, on dissection, are found to be connected not only with strong muscles, but with bones entirely concealed within the serpent, one jointed to another, so as to make the character of a rudimentary limb very apparent. These serpents, being almost all inhabitants of watery places, often lie in wait for animals that come to drink; thus the largest of the American species, *boa* (*eunectes*) *murina*—sometimes called anaconda, although anaconda seems to be originally, like B., the name of a serpent of the old world—is to be found where rivers or narrow lagoons are overshadowed by gloomy forests. Perhaps the want of sufficient supplies of water, more than the greater cold of the climate, may account for the short time that specimens of the boïdæ brought to Europe have generally lived in confinement.

After a repast, these serpents spend a considerable time in a state of comparative torpidity—several weeks generally elapsing before they waken up to require a new supply—and in this lethargic state they are easily killed. When they do waken up, the demands of appetite seem to be very urgent. Many of our readers must still remember the interest excited some years ago concerning a B. in the London zoological gardens, which, to the astonishment of its keepers, swallowed its rug; but this, after a trial of a week or two, it found indigestible, and the animal then gratified public curiosity by a reversal of the process of deglutition.

The head in the *boïdæ* is thick, yet somewhat elongated; the eyes are small; the body is thickest in the middle; the tail usually has a blunt termination. The scales are numerous and rather small. The colors are various, and in many of the species rather bright and elegantly disposed. The true boas have the plates underneath the tail single, whilst in the pythons they are double. The species to which the name *boa constrictor* is appropriated is far from being one of the largest, seldom attaining a length of more than 12 feet. It is common in Surinam and Brazil, where its skin is used for making boots and saddle-cloths. The name *boa constrictor* is, however, popularly extended to almost any of the species.—The number of species, whether in the genus or in the family, is far from being well ascertained.

Boas are much infested by intestinal worms, which appear often to cause their death. The excrement of the B.—the urine and fæces being combined as in other reptiles, and voided by a single vent—is a solid white substance, and consists mainly of urate of ammonia, accompanied by phosphate of lime (bone-earth). It is employed as an easy source of uric acid.

BOADICE'A, a warrior-queen of the Iceni, a tribe inhabiting the eastern coast of Britain, in the time of the Romans. She flourished after the middle of the 1st century. Prasutagus, her husband, who died A.D. 60, or 61, had left his wealth jointly to the Roman emperor Nero, and to his two daughters, hoping that by this artifice his kingdom would be protected from oppression; but the Roman soldiery, taking advantage of the defenseless condition of the country, began to plunder unscrupulously. B. herself was scourged, her daughters were violated, and the noblest among the Iceni were treated as slaves. These outrages soon drove the Britons to revenge. B. gathered round her a large army; attacked and captured the Roman colony of Camalodunum; defeated Petilius Cerealis, legate of the ninth legion, who was marching to its relief; took Londinium and Verulamium; and destroyed, it is said, somewhere about 70,000 Romans, many of them by torture. Suetonius, the Roman governor of Britain, now advanced at the head of 10,000 men against B., who, we are informed, had under her command no less than 263,000. A dreadful battle ensued (62 A.D.), in which, according to Tacitus, 80,000 Britons perished, and only 400 Romans. These figures, of course, cannot be trusted; but the victory must have been decisive, as it finally established the authority of the Romans in Britain. B., overwhelmed with despair, committed suicide.

BOAR, WILD, *Sus scrofa*, a species of *suidæ*, regarded as the original of the domestic swine, equal to the largest in size, and far superior in strength and ferocity. It is of grayish-black color, covered with short woolly hair, thickly interspersed with stiff coarse bristles, which assume the form of a mane along the spine. Its great tusks are formidable weapons, but when old the tusks curve over the snout, and are no longer serviceable for goring; but then the teeth of the upper jaw protrude and curve outward, serving the same purpose as the tusks had done. The animal is native in Europe and Asia, inhabiting the deep recesses of marshy forest grounds. Boars were common in England until the time of Henry II., and then not found until, in the reign of Charles I., an unsuccessful attempt was made to raise them in the New Forest. In the time of the conqueror any one killing a wild boar was liable to have his eyes put out. It was for many centuries a favorite beast of chase with the nobles in Europe, and was hunted chiefly on foot with the spear, its strength and ferocity rendering the sport alike exhilarating and dangerous. There is little of boar-hunting now except in India. The animal seeks its food at night, and feeds chiefly on roots and grain, though it will eat smaller animals, birds' eggs, etc. The bristles of the boar are much used for brushes.

BOARD, the general name applied to persons in special duties assigned to him. There are two civil or political lords, and three naval or sea lords. The first lord, who is always a cabinet minister, besides a general control, has the management of naval estimates, finance, political affairs, slave-trade prevention, appointments, and promotions. The first naval lord manages the composition and distribution of the fleet, naval discipline, appointment of inferior officers, commissioning ships, general instructions.

BOARD—BOARDING. In nautical language, *board* is used with many significations. Besides its ordinary application to a plank of wood, B. is a space or portion of sea over which a ship passes in tacking; hence the phrases, "to make a good board," "to make short boards," "to make a stern board," "to leave the land on back-board," etc.—all of which refer to the direction of a ship's movement at a particular time and place. Again, *board* or *aboard* relates to the interior of the ship, in such phrases as "to go aboard," "to heave overboard," etc.

But the most important of these meanings is that which relates to the *boarding* of an enemy's ship, or making a forcible entry for the sake of capturing it. Whenever this

bold operation is determined on, certain seamen are told off to act as boarders. It is very rarely that, between two men-of-war, this operation is ventured on; it would, in most cases, be too perilous to the assailants, who more frequently conquer by cannon and musketry. Boarding is, in most instances, attempted by privateers against merchantmen, where the defenders are few in number. The assailant well considers all the circumstances for and against him—the relative sizes of the two vessels, the relative strength of the crews, the state of the wind and sea, and the chances of escape if foiled. Besides the pistols, cutlasses, and boarding-pikes of the seamen, there are provided powder-flasks for producing smoke and confusion on the enemy's deck, and shells called stink-pots, for producing an intolerable stench. The moment and the spot being selected, the fuses of the flasks and stink-pots are lighted; these combustibles are thrown upon the enemy's deck; and while the fire, smoke, and stench are doing their work by confusing the enemy, the boarders climb on board, and gain a mastery by their personal prowess—that is, if the calculations of relative strength have been duly made. Sometimes terrible hand-to-hand encounters take place on deck before victory decides for or against the assailants.

General sir Howard Douglas, in his able work on *Warfare with Steam*, expresses an opinion that steam war-ships are likely sometimes to come to close quarters; and that, on that account, they should be provided with a larger quota of marines and of boarding-implements than have hitherto been supplied to sailing ships. The defenders, he adds, should construct loopholed barricades across the terminations of the quarter-deck and the forecastle, to prolong the defense within board. The French naval officers, it is known, look forward to a great increase in all such military resources on board war-steamers; and sir Howard endeavors to impress similar convictions on the English authorities.

BOARDMAN, GEORGE DANA, 1801-31, b. Maine; educated at Waterville college, where he was chosen tutor. In 1823, he offered to become a missionary under the Baptist board of foreign missions, and having studied at Andover theological seminary, was ordained in 1825, and in the same year sailed for Calcutta. He established a mission at Maulmain in 1827, which soon became the most important station under the board. For three years he labored incessantly with unabating zeal and accomplished an immense amount of work, till his course was cut short by death.

BOARDMAN, GEORGE DANA, D.D., son of George Dana, b. in Burmah, 1828; graduate of Brown university and Newton theological institution; ordained in South Carolina, but became pastor first in Rochester, N.Y., whence he went to the First Baptist church in Philadelphia, where he still remains (1880). He has traveled in the east and in Europe, and has delivered courses of lectures in Philadelphia which have drawn great week-day audiences.

BOARD OF ADMIRALTY, a government department which has the management of all matters concerning the British navy. In the article ADMIRAL, the steps are noticed by which the duties of the lord high admiral, in former days, were transferred to a board of commissioners. The constitution and functions of this body will now be described.

The B. of A. comprises five lords commissioners, who decide collectively on all important questions. Besides this collective or corporate action, each has special duties assigned to him. There are two civil or political lords, and three naval or sea lords. The first lord, who is always a cabinet minister, besides a general control, has the management of naval estimates, finance, political affairs, slave-trade prevention, appointments, and promotions. The first naval lord manages the composition and distribution of the fleet, naval discipline, appointment of inferior officers, commissioning ships, general instructions, sailing orders, and the naval reserve. The second naval lord attends to armaments, manning the navy, the coast-guard, the marines, marine artillery, and naval apprentices. The third naval lord has control over the purchase and disposal of stores, victualing-ships, navy medical affairs, transports, convicts, and pensioners. The junior civil lord attends to accounts, mail-packets, Greenwich hospital, naval chaplains, and schools. Naval architecture, the building and repairing of ships, steam-machinery, and new inventions are superintended by the controller of the navy, who is not a member of the board, but is directly responsible to the first lord. Under the lords are the first secretary (parliamentary), the second secretary (permanent), and the naval secretary (professional), who manage the daily office work. The lords all resign when the prime minister resigns, and those who have seats in parliament are replaced by others. This change gives rise to many evils. There is likely to be a change of views and of system: the new board is not bound to act on the plans of its predecessors; and many of the costly novelties in the navy within the last ten years are directly traceable to this cause. The system is defended on the plea that these changes infuse new blood into the admiralty, and give fair-play to increased knowledge and new plans. Some statesmen advocate a modified plan: proposing to render a few naval officers of rank *permanent* lords of the admiralty, and only changing the others on a change of ministry. A connecting-link between the old and new boards is the controller of the navy, who is a permanent officer. The secretaries and the lords determine which letters ought to be submitted to the board collectively; and that portion of the correspondence is treated as in

most boards and committees. All delicate or doubtful matters are specially reserved for the first lord; but in the board meetings he has only one vote, like the rest, though, from his general parliamentary responsibility, he has practically at once an absolute veto and an absolute power of giving action to his views. The admiralty offices are at Whitehall and Spring Gardens, close adjoining.

BOARD OF ORDNANCE, a government department formerly having the management of all affairs relating to the artillery and engineering corps, and to the *matériel* of the British army. Under this precise designation, the board no longer exists; a change having been made which requires brief explanation. The board existed from the time of Henry VIII. until 1855, when it was abolished, its functions being vested in the secretary of state for war as regarded *matériel*, and in the commander-in-chief as concerned the military command of the artillery and engineers. The B. of O., until 1854, comprised the master-general of the ordnance, the surveyor-general, the clerk of the ordnance, and the principal storekeeper, all of whom were usually members of parliament. There was no chairman at the meetings, and the board often consisted of only one officer. The master-general had a veto, and was in that respect more powerful than the chief member of the board of admiralty; although, not having necessarily a seat in the cabinet, he had less political power. The board days were thrice a week; and each of the four members had control over certain departments—the patronage of which was generally vested in him. Scarcely any improvements were made from 1828 till 1854, and the general arrangements were very defective. Of the four members, the master-general, besides his veto, had a general authority; the surveyor-general had control over the artillery, engineers, sappers and miners, ordnance medical corps, contracts, laboratory, gunpowder, barracks, and navy gunners; the clerk of the ordnance managed the estimates, money-arrangements, civil establishment, pensions, superannuations, and ordnance property; while the principal storekeeper had charge of stores, store-rooms, naval equipments, and naval war-stores. In matters relating to coast-defenses, it was often difficult to decide between the admiralty and the ordnance, each board claiming authority. When the Crimean disasters took place in 1854, the defects of the B. of O. became fully apparent: it could not work harmoniously with the other government departments. The board was dissolved, and the office of master-general abolished. By the war office act of 1870, the post of surveyor-general of the ordnance was revived as one of the principal officers of the secretary of state for war. He is responsible for the *matériel* and supplies of the army.

BOARD OF TRADE. See TRADE, BOARD OF.

BOAR-FISH, *Capros*, a genus of fishes of the dory (q.v.) family, or *zeïdæ*, differing from the genus *zeus*, or dory, in the still more protractile mouth—the resemblance of which to the snout of a hog is supposed to have given origin to the name—in the want of spines at the base of the dorsal and anal fins, and of long filaments to the dorsal spines. The body has the usual oval, much compressed form of the family. The common B. (*C. aper*) is a well-known inhabitant of the Mediterranean, rarely caught on the coasts of England. The eyes are very large, and placed far forward; the body is of a carmine color, lighter below, and with seven transverse orange bands on the back. The flesh is little esteemed.

BOAR'S HEAD. The B. H. is the subject of a variety of legends, poetic allusions, and carols connected with the festivities of Christmas in England. At this wintry season, the wild boar was hunted, and his head served up as the most important dish on the baronial table. According to Scott's graphic lines:

> Then was brought in the lusty brawn
> By blue-coated serving-man;
> Then the grim boar's head frowned on high,
> Crested with bays and rosemary.
> Well can the green-garbed ranger tell
> How, when, and where the monster fell;
> What dogs before his death he tore,
> And all the baiting of the boar.

Referring to the article CHRISTMAS for a notice of some of the observances on this occasion, we need here only say that in the "boar's-head carols" are found some of the most interesting specimens of the old English convivial verses. The following, from a carol printed by Wynkin de Worde (1521), may be given;

> *Caput Apri defero*
> *Reddens laudes Domino.*
>
> The boar's head in hand bring I,
> With garland gay and rosemary;
> I pray you all sing merrily
> *Qui estis in convivio.*
>
> The boar's head, I understand,
> Is the chief service in this land;
> Look wherever it be found,
> *Servite cum cantico.*

The boar's head "erased," according to heraldic phraseology, is a well-known cognizance of a number of old families, particularly the Gordons; it also formed the sign of a

tavern at Eastcheap, London, which has been immortalized by Shakespeare. On the site of this famed tavern now stands the statue of William IV.

BOAST (Fr. *ebaucher*), a word in use with sculptors. To B., as its French original implies, is to block out a piece of stone or wood, so as to from a rude approach to the ultimate figure, leaving the smaller details to be worked out afterwards. Ornamental portions of buildings are often inserted in their places in this condition, and frequently remain so if they are in an obscure position.

BOAT is the general name for a small open vessel. Boats differ, however, greatly one from another. They may be slight or strong, sharp or flat-bottomed, decked or undecked, swift for dispatch or roomy for cargo, ornamental for pleasure or plain for hard service, deep or light of draught for deep or shallow water. The chief variety supplied to ships of war are the following—*Long-B.:* The largest B. of a ship, furnished with mast and sails; it is either armed and equipped, to render warlike service in certain situations, or it is employed to fetch water, wood, provisions, and heavy stores on board. *Launch:* longer and more flat-bottomed than the long-B.; being rowed with a greater number of oars, it makes more rapid progress up rivers. *Barge:* a long, narrow, light B., employed in carrying the principal officers to and from the ship; for other kinds of boats or vessels under this name, see BARGE. *Pinnace:* a B. for the accommodarion of the inferior officers; it has usually eight oars, whereas the barge has 10 or more. *Cutter:* broader, deeper, and shorter than the barge or pinnace; it is rowed with six oars, sometimes hoisting a sail, and is chiefly employed in carrying light stores, provisions, and crew. *Jolly-B.:* a smaller cutter, rowed with four oars instead of six. *Yawl:* small in size and used for nearly the same purpose as cutters and jolly boats. *Gig:* a long narrow B., rowed with six or eight oars, and employed by the chief officer on expeditions requiring speed. Some of the above-named boats are diagonal-built for strength; the others are clinch-built, to be as light as possible. The largest ships of war carry boats of all these various kinds, varying in weight from 110 cwt. down to 10 cwt.; the smaller ships carry fewer; while merchant-ships have seldom more than three—except passenger-ships, which are bound by law to carry boats enough to save all the passengers and crew in case of disaster. There are other kinds of boats which do not belong to ships. See BOATING.

In reference to the legal regulation of boats in the merchant service, the following are the chief provisions: When a B. belongs to any ship or other vessel, the name of the vessel and of the place to which she belongs must be painted on the outside of the stern of the B., and the master's name within side the transom—the letters to be white or yellow on a black ground. Boats not belonging to ships or other vessels must be inscribed with the name of the owners and the port to which they belong. All boats having double sides or bottoms, or any secret places adapted for the concealment of goods, are liable to forfeiture.

The boats intended for the rescue of shipwrecked persons, or crews and passengers exposed to that danger, are described under LIFE-BOAT.

BOATBILL, *Cancroma cochlearia*, a bird of the heron (q.v.) family, the only known species of a genus differing from the true herons in little else than the form of the bill, which is comparatively short, and very broad, the mandibles resembling the bowls of two spoons placed one upon the other, the upper mandible overlapping the lower, keeled on its upper ridge, and hooked at the point. The B. is about the size of a domestic fowl, has shorter limbs than most of the herons, but resembles them in plumage, and is abundantly provided with elongated feathers on the back of the head and neck, which it erects when irritated. Its general color is rusty red, the forehead and breast whitish. It inhabits Cayenne, Surinam, Brazil, etc., sits perched upon trees which hang over streams, and darts down upon fish, which seem to be its principal food.

BOAT-FLY, *Notonecta*, a genus of insect of the order *hemiptera* (q.v.), suborder, *heteroptera*, and of the family of the *hydrocorisæ*, or water-bugs (q.v.). All of them, like the rest of the family, are aquatic insects. Their English name is derived from their boat-like form, eminently adapted for progression in water, and probably also from their remarkable habit of always swimming on their back—peculiar to the genus *notonecta*, as restricted by recent entomologists—and of resting in this posture suspended at the surface of the water. The known species of this genus are not numerous. One of them, *N. glauca* (sometimes called the *water boatman*), is common in Britain: it is about half an inch long, and varies considerably in color; but exhibits a general greenish tinge, the other colors being black, brown, and gray. They fly well, but seldom use their wings. They move with difficulty on dry ground. When they descend into the water, they carry down a supply of air for respiration in a hollow between their folded wings. They feed on animal substances, and often kill and devour those of their own species.

BOATING, the art of managing and propelling a boat. This is done either by means of oars or sails. As sailing is fully treated under the head of YACHT, rowing only is dealt with here. The most ancient form of boat known to have been used in the British islands is the coracle; it is still much used in Wales. The *coracle* is but a large wicker-work basket, covered with skins, or some thin water-proof substance stretched over the wicker-work, strengthened by a cross seat. Seated in one of these rude boats, with but a single paddle, it is astonishing with what dexterity the paddler will skim over broken

water, and avoid dangers which would infallibly destroy a heavier or less manageable craft. From the coracle spring all the varied classes of boats now in use, either as pendants to ships, or as used for pleasure traffic or a means of conveyance upon our rivers and inland waters. The *wherry* next claims attention. There are many kinds of wherries, but we only notice the Thames wherry. This is stoutly built, and is constructed to carry about eight passengers. It is usually managed by one sculler or two oarsmen; it is almost entirely employed by watermen for the conveyance of passengers or pleasure-parties. The boats used for rowing as a sport or pastime are of a much lighter and sharper build. They are constructed of all sizes, to carry from twelve oarsmen down to a single sculler. Of this class of boats for racing purposes, we have the 8, 6, 4, 2, and single pair oared boats; while in contests between single scullers, we have what is denominated the *wager-boat*—a boat so frail and light in its proportions, that none but a most experienced sculler can sit in one without danger of upsetting. For pleasure, we have another class of boats denominated *gigs*, of stouter and more capacious build; they are constructed either for four oars, a pair of oars, or single sculls. Boat-racing is a practice of some antiquity, but it has only culminated in our day. Many prizes have been given from time to time for competition, some of which have been made annual. Perhaps the most famous of all these is Dogget's coat and badge, which is rowed for yearly on the Thames by watermen's apprentices, on the 1st of Aug. But the events of most note in the rowing world are the Oxford and Cambridge 8-oared match, rowed annually upon the Thames, from Putney to Mortlake. This match has not been a regular yearly match, there having been occasional intervals at times of a year or two. In 1829, 1842, 1849, 1852, 1854, 1857, 1859, from 1861 to 1869 inclusive, and in 1875, the Oxford boat carried off the prize; Cambridge having wrested it from Oxford in the years 1836, 1839, 1840, 1841, 1845, 1846, 1849, 1856, 1858, 1860, 1870–1874, and 1876. Thirty-three matches have come off in 48 years, the balance being on the side of Oxford. It will be noticed that two matches were rowed in 1849. The best picked men from each university are selected to contest this great event, and the hardest exercise and the severest training gone through by the crews, to improve their wind, strength, and endurance, for months before the day of rowing; their diet consisting mainly of the plainest cooked lean meat and potatoes, with malt liquors, spirituous drinks being prohibited, and the duties of temperance, soberness, and chastity strictly enforced. It was at one time thought that light men stood the best chance in these matches, but experience has shown this to be an error, and 10, 11, and 12 stone men are now chiefly selected. The distance rowed upon this course is 4¼ miles. The time chosen is usually at slack-tide, and the time taken in rowing varies according as there is little or no tide or wind, or the reverse, from 18 to 26 minutes. The introduction of sliding-seats has added very greatly to the power of the rower by lengthening the stroke. The sliding-seat is a small piece of board on which the rower sits, and which works on rollers, and slides backwards and forwards as the rower makes his stroke. From 36 to 44 strokes of the oar per minute is held to be fair racing-pace; and a long, steady, even stroke—the blade of the oar not being dipped too deeply in the water, or thrown too high above the surface when withdrawn, the arms being well extended in taking the stroke, and the elbows brought well home to the sides at the conclusion—is the kind of stroke now preferred by connoisseurs. The other great events of the boat-racing world are the regattas of Henley and Putney. At the former, the Oxford and Cambridge crews usually fight their battle over again in conjunction with others for the challenge-cup; and at these also many scullers' matches are rowed, though single scullers' races for the championship of the Thames, etc., are usually events of themselves. Campbell was one of the first sculling champions, beating Williams in 1831. He was beaten by Robert Coombes in 1846, who held the championship for about six years. He at length succumbed to the prowess of Cole in 1852. Cole, in 1854, was beaten by Messenger; Messenger yielded the palm to Kelly in 1856; and Kelly was, in 1859, beaten by Robert Chambers, the champion of the Tyne. In 1865, Kelly recovered his laurels, and beat Chambers. In 1867, he beat him also on the Tyne; and in 1868, he had in turn to yield to Renforth, having been champion off and on for 12 years. An Australian oarsman, named Trickett, won the championship in 1876, by beating Sadler, then champion. So much is B. favored at our universities and schools, that almost every college has its club.

BOAT-LOWERING APPARATUS is the name given to certain ropes and pulleys for lowering boats from ships quickly and safely, in case of emergency. Every passenger ship is compelled by law to carry a certain number of boats, depending on the tonnage; and every ship of war necessarily carries boats (see BOAT) for minor services; but until recent years the apparatus was very inefficient for lowering these boats from the davits or cranes by which they are usually suspended. In shipwreck or other emergencies at sea, the boats were, until recent years, often so difficult to extricate that they could not be lowered in time to save the crew and passengers; or in lowering they capsized, and plunged the unhappy persons into the sea. Many inventors have recently directed their ingenuity to this subject, with a hope of devising a remedy. In Lacon's apparatus, the principal feature is the employment of a friction-brake, by which one man can regulate the rate of descent to varying degrees of speed. Capt. Kynaston's *disengaging hooks* are intended not only to lower boats quickly and safely when suspended over the side of the

ship, but also to hoist them out quickly when they happen to be stowed in-board. Wood and Rogers's apparatus resembles Kynaston's in this: that the actual lowering from the ship is effected by the crew on shipboard, leaving to the person or persons in the boat only the duty of disengaging it from the tackle. But the apparatus which now engages most attention is Clifford's, the leading principle of which is, that the lowering and the disengaging are both effected by one man seated in the boat. Two ropes or lowering pendants descend from two davits, pass through blocks or sheaves, then through other blocks, within and near the keel of the boat; and finally, round a roller, placed horizontally beneath the seat on which the manager of the boat takes his place. By means of a winding rope, held in one hand, he can regulate the speed with which the other two ropes uncoil themselves from the roller, thus graduating the boat's descent to the water's level. When lowered, the two ropes can be thrown off and the boat set free. The slings or lifts are intended to prevent the canting or upsetting of the boat. The lanyard belongs to the lashings which hold the boat to the side of the ship; but by the thimbles slipping off the prongs the boat is liberated. The efficiency of the apparatus is most remarkable. In 1856, by order of the admiralty, experiments were made with the starboard-cutter of H.M.S. *Princess Royal*. Twelve men got into the boat while it was hanging from the davits; it weighed, with the crew and the gear, nearly 3 tons; nevertheless, this cutter, thus laden, was successfully and quickly lowered by one of the 12 men, to a depth of 40 ft. from the davits to the water. Many other experiments of similar kind were made. Clifford's apparatus is now supplied to many ships of war and merchant-vessels; and many lives have been saved by its means, under circumstances which would almost certainly have proved fatal under the old mode of lowering boats from the davits.

Other systems have since been partially adopted; but none has yet been found which is wholly satisfactory to naval men.

BOATSWAIN is a warrant-officer on board her majesty's ships, who has charge of the boats, sails, rigging, cables, anchors, flags, and cordage. He is immediately under the master in some of these duties; he frequently examines the masts and yards, sails and ropes, to report on their condition and efficiency. He also keeps account of all the spare rigging, etc., and superintends the replacement of old by new. The B. has certain duties in connection with the crew: he assists in the necessary business of the ship, and in relieving the watch. In bad weather, he looks well to the boats and anchors, especially when night is coming on. A B. should be a good sailor, a good rigger, and a vigilant, sober, firm man.

The *boatswain's mate* assists in all the above-named duties; and to him is assigned the repulsive, though now, happily, very rare office of inflicting the flogging awarded to very serious offenses.

BOBADILLA, FRANCISCO DE, d. 1502; Spanish governor of San Domingo, who was sent from Spain in 1500 to investigate charges of maladministration against Columbus. He arrested the discoverer and sent him in chains to Spain; but the act was disowned by the king, and Columbus was restored and sent back, arriving on the day that B., who had been recalled, sailed for Spain. The fleet was wrecked and B. was drowned. But for his treatment of Columbus this vain and tyrannical man would not have been known in history. Probably Ben Jonson's "Capt. Bobadil," the silly braggart in *Every Man in his Humor*, was suggested by this knight of Calatrava.

BOBBIN-NET is the name of a kind of net-fabric, usually made of cotton-thread. It is of the nature of lace, but is made in the lace-frame instead of by hand. The texture is peculiar: it consists in the interlacing of a set of long threads, representing the warp in common weaving, with a set of cross ones (the weft), in such a manner as to form a mesh-texture. B. is one of the most elegant of textile fabrics, and forms an extensive branch of business, the chief seat of the manufacture in this country being Nottingham. See LACE MANUFACTURE.

BOBBINS are small wooden rollers, flanged at the ends, and bored through the center lengthwise, so that they can be placed on a spindle or skewer. The bobbin on which ordinary sewing-thread is wound, although generally of small size, is a good example of their prevailing shape. One or two kinds are, however, of a different type; thus the bobbin, called in Scotland pirn, for delivering the weft from the shuttle, is simply a tapered pin, bored, it may be, throughout, with but the rudiments of a flange at the thick end; and the bobbin used for a similar purpose in lace-weaving, is merely a thin metal pulley, about the size of a halfpenny. For the machines used in the various spinning processes of the textile industries—namely, the slubbing, the roving, the drawing, and spinning frames, bobbins of various sizes, and in enormous numbers, are required. Some of these are 15 in. long by 5 in. in diameter, and diminish in size for each succeeding process, those for the spun-yarn being scarcely larger than a good-sized thread-bobbin. There are also winding and warping bobbins for the weaving processes. For some purposes paper tubes have of late years superseded bobbins.

We are so familiar with the neat and convenient thread-bobbin, now seen in every house, that we are apt to think it a very old invention. Yet people are still living who can remember when all the sewing-thread used for domestic purposes was wound in the form of balls.

In the making of thread-bobbins, ingenious automatic machinery is now employed.

Transverse slices of common birch, the wood chiefly used for these, are first cut to the length of the bobbins. From each of these a number of circular bobbin blanks are next cut out by an annular saw, a hole being drilled through the center of each at the same time. These blanks are then fed into a self-acting turning-machine, operating with a compound cutting tool, whose form is the reverse of the profile of the bobbin. One of these machines produces from 80 to 100 gross of bobbins per day, while an expert hand-turner could not produce more than eight gross in the same time. As most of the bobbins required for spinning purposes are larger than those required for thread, they are made by turning the barrels and ends separately, and then gluing them together, in order to save wood.

Bobbins are made of various kinds of wood, but principally of birch, beech, ash, and plane tree. Sometimes two kinds are used in the same bobbin; and for some special purposes, bobbins are made entirely of metal, such as iron or tinplate. Of late years, some bobbin manufactories have been erected in the highlands of Scotland, in neighborhoods where birch is plentiful. When we consider that there are now about 40 millions of spindles in the spinning-mills of Great Britain, we get some idea of the prodigious number of bobbins constantly wanted to suyply the tear and wear of those used in the spinning processes. One or two of the larger bobbin manufacturers in England employ about 300 hands.

BOBBIO, a t. in Northern Italy, in the province of Pavia, is situated near the left bank of the Trebbia, about 37 m. n.e. of Genoa. B. is an ancient place, having originated from a church and convent erected here in the end of the 6th, or beginning of the 7th c., in the crypt of which St. Columbanus and some of his disciples lie buried. B. has a cathedral, an episcopal palace, and a palace belonging to the Malaspina family. It is guarded from the inundations of the Pellice by a long embankment, built by a money-grant from Oliver Cromwell, during whose protectorate the town was nearly destroyed by an inundation. Pop. about 4000.

BO'BIA, or PIRATE ISLE, a singular island in the bay of Amboise, off the coast of Guinea, Africa. Originally of considerable size, it has been greatly reduced by the action of the waves, and the same agency is still gradually lessening it. It is difficult of access, on account of the precipitous character of its shores, but is said to be densely peopled.

BOB-O-LINK, or BOBLINK, REED BIRD, or RICE BIRD, *Dolichonyx oryzivorus*, a bird nearly allied to buntings and sparrows, but of a genus characterized by stiff-pointed tail-feathers. It is rather larger than a yellow-hammer; and the male in his summer or nuptial plumage exhibits a fine contrast of colors, black, yellow, and white. The female differs greatly from the male in colors of plumage, yellowish-brown chiefly prevailing; and in the latter part of summer, the males assume the comparatively dull hues of the females. The B. is a bird of passage, spending the winter in the West Indies. In summer it is found as far north as the banks of the Saskatchewan, in lat. 54°, but is most plentiful in the Atlantic states and other eastern parts of America, where it is to be seen in every meadow and cornfield. It renders good service by the destruction of insects and their larvæ; but the immense flocks which congregate on their return southwards in autumn, commit great ravages in the rice-plantations of Carolina. At this season, these birds become extremely fat, and are killed in great numbers for the table. Their flesh is delicate, and resembles that of the ortolan.

The B. generally makes its nest in a grassy meadow, an artless structure of a few dry stalks and leaves, with a lining of finer grass. It displays the same instinct with many other birds, of seeking to lead intruders away from its nest, by pretending great anxiety about some other part of the field. During the breeding-season, the males are very musical, singing mostly in the air, in which they seem to rise and fall in successive jerks. Their song is very pleasing, and is "emitted with a volubility bordering on the burlesque." On account of their beauty and powers of song, many are caught, caged, and sold in the New York and other markets.

BOBRUISK, a fortified t. of Russia, in the government of Minsk, and 88 m. s.e. of the city of that name. It is situated on the right bank of the Beresina, and is a station for the steam-packets navigating the Dnieper and Beresina. It was besieged ineffectually by the French in 1812. Pop. '67, 24,681.

BOB-STAY, in the rigging of a ship, is a rope used to confine the bowsprit down to the stem or cut-water: its purpose is to keep the bowsprit steady, by counteracting the force of the stays of the foremast, which draw it upwards.

BO'CA (Span. meaning *mouth*), a term applied to the entrance of various straits and rivers, chiefly in America.—1. B. *Chica*, the channel of 28 m. in length, which leads to Cartagena in New Granada.—2. B. *de Navios*, the largest and most southerly outlet of the Orinoco.—3. B. *Grande*, a bay of the Caribbean sea, at the mouth of the Zucar, in Costa Rica.—4. B. *del Toro*, on the Caribbean sea, in Costa Rica, in lat. 9° 20′ n., and long. 82° west.

BOC'CA TI'GRIS, or BOGUE, the name given to that portion of the estuary of the Canton river (q.v.) extending n. from lat. 22° 45′ n.; s. of this point, the estuary is designated the "outer waters." In the center of the B. T. are the rocky islands of North

and South Wantung, while on the e. the B. T. has the islands of Anunghoy and Chuenpee, and on the w. the Ty-cock-tow island. On these islands are situated the Bogue forts, which have been more than once captured by the British. The last time they were taken was in Nov., 1856, the occasion of quarrel being the refusal of the Chinese to make proper reparation for the capture of a vessel under British protection, but alleged, on the other hand, to be nothing but a smuggling craft, contriving to hide its real character by hoisting the British flag.

BOCCAC'CIO, GIOVANNI, the celebrated author of the *Decamerone*, was b. in Paris, 1313. He styled himself *Da Certaldo*, and was sometimes named *Il Certaldese* by others, because his family sprang from Certaldo, a village in the Florentine territory. From an early period he displayed an invincible attachment to poetry, which his father attempted in various ways to thwart; but, as soon as B. had attained his majority, he commenced to follow vigorously his own inclinations, poetizing both in the Italian and Latin tongues, but not with any "fine issues." In prose, he succeeded far better, developing quickly that airy grace of style which suits so admirably his light and lively tales, and which soon placed him in the highest rank of Italian prose-writers. He studied Dante closely, but did not confine himself to literature properly so called. In 1350, B. formed an intimate friendship with Petrarch, and, following his friend's example, collected many books and copied rare MSS., which he could not afford to buy. It is said that he was the first Italian who ever procured from Greece a copy of the *Iliad* and the *Odyssey*. He also wrote a *Genealogy of the Gods*, in 15 books, which was unquestionably the most comprehensive mythological work that Europe had as yet seen. But not only was B. one of the most learned men of his time, he was also one of the most enlightened in his scholarship. He helped to give a freer direction and a greater expansiveness to knowledge, stimulated his contemporaries to the study of Greek, and wished to substitute the wisdom of antiquity for the unprofitable scholasticism that prevailed.

While in Naples (1341), B. fell passionately in love with a young lady who was generally supposed to be an illegitimate daughter of king Robert. His passion was returned, and, to gratify his mistress, B. wrote *Il Filocopo*, a prose-romance, and afterwards *La Teseide*, the first attempt at romantic epic poetry, and written in *ottava rima*, of which B. may be considered the inventor. In 1342, he returned to Florence, but in 1344 went back to Naples, where he wrote his *Amorosa Fiammetta*, *Il Filostrato*, and *L'Amorosa Visione*. Here, also, he composed his famous *Decamerone*, to please Joanna, the daughter and successor of king Robert. It consists of 100 stories, 10 of which are told each day by 7 ladies and 3 gentlemen, who had fled from Florence during the frightful plague of 1348, to a country villa, and who try to banish fear by abandoning every moment to delicious gayety. It is impossible to exaggerate the literary merits of the book. In abundance of incident especially, it is almost inexhaustible, though many of the stories are taken from older collections of *Contes et Fabliaux*. It is, however, unfortunately steeped in impurity. B. once more returned to Florence about 1350. He was now honored with several diplomatic appointments by his fellow-citizens, and subsequently even thought of entering into holy orders as a penance for the immoral life he had previously led. From this artificial course of repentance he was wisely dissuaded by Petrarch, who advised him to be content with changing his conduct. In 1373, B. was appointed Dantean professor at Florence; that is to say, he was to deliver elucidatory lectures on the *Divina Commedia* of the great poet, and zealously devoted himself to the difficult task thus imposed on him; but, his health failing, he resigned the office, and retired to his little property at Certaldo, where he died, Dec. 21, 1375, 16 months after his friend Petrarch. Besides those works we have already mentioned, B. wrote *Origine, Vita e Costumi di Dante Alighieri*, and *Commento sopra la Commedia di Dante*. This commentary on the Divine Comedy extends only to the 17th canto of the *Inferno*. In Latin, B. wrote, besides the *Genealogia Deorum*, a work arranged in alphabetical order, *De Montibus, Silvis, Fontibus, Lacubus, Fluminibus*, etc.; *De Casibus Virorum et Fœminarum Illustrium; De Claris Mulieribus*, etc.

BOCCAGE, MARIE ANNE FIQUET DU, a French poetess, was b. at Rouen, 22d Oct., 1710, and received her education in the monastery of the Assumption at Paris, where her poetic tendencies early developed themselves, though only furtively. She first appeared as an authoress in a small volume of poems, published in 1746; next as an imitator of Milton in her *Paradis Terrestre* (1748); and, in 1756, issued her most important work, *La Colombiade*. The letters which she addressed to her sister, Madame Duperron, while traveling through England, Holland, and Italy, are the most interesting things which have fallen from her pen. During her life, she was excessively admired and bepraised, especially by Voltaire, Fontenelle, and Clairaut. She used to be described as *Formâ Venus, arte Minerva!* The complimentary poems addressed to her would, if collected, fill many volumes. She was elected member of the academies of Rome, Bologna, Padua, Lyon, and Rouen. She died 8th Aug., 1802. Her poems fail now to explain the reputation she once enjoyed, and dispose us to believe that her personal attractions must have given a charm to her verses.

BOCCALI'NI, TRAJANO, 1556–1613; an Italian satirist. Under the favor of Gregory XIII. he held several offices, the most important being that of governor of Benevento.

His most important work is *Ragguagli di Parnaso*, in which Apollo is represented as receiving the compliments of all who present themselves, and distributing justice according to the merits of each case. The book is full of light fantastic satire. The only government that escapes his attacks is that of Venice, a city for which he had a special affection. Other works of his were the *Pietra*, and commentaries on Tacitus.

BOCHART, SAMUEL, a learned Protestant divine, was b. of an ancient family at Rouen, in 1599. He very early exhibited remarkable talent, chiefly philological. After studying at Paris, Sedan, and Saumur, visiting England in 1621, and finishing his education at Leyden, he was chosen pastor of the Protestant church at Caen, where he became very popular. In 1629, he gained great reputation by his victory, in a public discussion of several days' duration, over the famous Jesuit, Dr. Verin. The meetings gained additional éclat from the occasional presence of the viceroy of Normandy, the duke of Longueville. In 1646, appeared his sacred geography, bearing the title of *Phaleg* and *Canaan*. His *Hierozoicon*, or Scripture zoology, to which he devoted many years of his life, appeared posthumously in 1675. In 1652, B. was invited to Stockholm by queen Christina, and went thither accompanied by his friend Huet. The court-life, however, did not suit him, and his visit was short. He died suddenly, in 1667, while speaking at a meeting of the Caen academy of antiquaries. A complete edition of his works, with a life by Morin, was published at Leyden in 1712; and a new improved edition of the *Hierozoicon*, his most valuable work, at Leipsic, in 3 vols. 4to (1793–96), by Rosenmüller.

BOCHNIA, a t. of Austrian Galicia, capital of a circle of the same name, and about 25 m. e.s.e. of Cracow. The houses are built chiefly of wood. There are extensive mines of rock-salt in its vicinity, which employ upwards of 500 miners, and yield annually about 13,000 tons of salt. Pop. '69, 8040.

BOCHOLD, or BOCHOLT, a t. in the province of Westphalia, Prussia, on the Aa, 44 m. w.s.w. of Munster. In the neighborhood is a large iron mine. Pop. '71, 6125.

BOCHUM, a chief t. in Westphalia, government of Arnsberg, noted for manufactures of cassimeres, woolens, carpets, hardware, and steel, and considerable trade in grain. Coal-mines are also worked. Pop. '71, 21,192.

BOCK, KARL ERNST, b. Leipsic, 1809; graduate of the university there. He devoted himself to medicine and anatomy, and became professor in the university and director of the clinical department. He is the author of a number of important anatomical works, an atlas of anatomy, etc.

BOCKENHEIM, a manufacturing t. in Germany, 1 m. from Frankfort, on the Main and Weser railroad; pop. '71, 8476.

BÖCKH, AUGUSTUS, the most erudite classical antiquary of Germany in recent times, was b. Nov. 24th, 1785, at Carlsruhe, and entered the university of Halle in 1803. The prelections of Wolf determined him to the science of philology. His first publication was *Commentatio in Platonis qui vulgo fertur Minoem* (Halle, 1806). In 1808, appeared his *Græcæ Tragœdiæ Principum, Æschyli, Sophoclis, Euripidis, num ea quæ supersunt et genuina omnia sint*. In 1809, he became ordinary professor of the university of Heidelberg; and in 1811, he was translated to the chair of rhetoric and ancient literature, at Berlin, where he taught for upwards of 40 years, forming many excellent scholars, and extending his reputation through all the learned circles of Europe. His conception of philology as an organically constructed whole, which aims at nothing short of an intellectual reproduction of antiquity, excited for a long time great opposition among his professional contemporaries, but it undoubtedly gave an impetus to a deeper study of the old classical world. His lectures include not merely a grammatico-historical interpretation of the ancient authors, but also archæology proper, the history of ancient literature, philosophy, politics, religion, and social life. The four great works of B. which have, in fact, opened up new paths in the study of antiquity, are, first, his edition of Pindar (2 vols., Leip. 1811–22), in which the meter and rhythm of the poet, as well as his artistic skill, are investigated and discussed with profound knowledge of the subject. 2d, *The Political Economy of Athens* (2 vols., Berlin, 1817), a work which remains unsurpassed for subtle research, surprising results, and clear exposition. It treats of the prices of goods, rate of workmen's wages, rent of houses and land, and other points of commercial economy, as well as of the larger questions of the state income and expenditure. It has been translated into English by Sir George Cornewall Lewis, under the title of *The Public Economy of Athens* (Lond. 2d edit. revised, 1842). 3d, *Investigations concerning the Weights, Coins, and Measures of Antiquity* (Berl. 1838). 4th, *Records of the Maritime Affairs of Attica* (Berl. 1840). The most important of his lesser works are the *Development of the Doctrines of Philolaus, the Pythagorean*, his edition of the *Antigone* of Sophocles, and a *Dissertation on the Silver Mines of Laurion in Attica*. B. has also the honor of having commenced, in 1824, the great work entitled *Corpus Inscriptionum Græcarum*, published at the expense of the royal academy of Berlin, which was afterwards continued first by Franz, and then by Kirchhoff. In 1852, appeared his *Researches on the Cosmical System of Plato;* in 1855, *The Lunar Cycles of the Greeks;* and, in 1863, *On the Four-year Solar Cycles of the Ancients*. He died in 1867.

BOCKLAND, BOCLAND, or BOOKLAND, one of the original modes of tenure of manor-land, also called charter-land, or deed-land, which was held by a short and simple deed under certain rents and free services. It was land that had been severed by an act of government from the *Folcland* (q.v.), and converted into an estate of perpetual inheritance. It might belong to the church, to the king, or to a subject; it might be alienable and divisible at the will of the proprietor; it might be limited in its descent, without any power of alienation in the possessor. It was often granted for a single life or for more lives than one, with remainder in perpetuity to the church. It was forfeited for various delinquencies to the state.

The estate of the higher nobility consisted chiefly of bockland. Bishops and abbots might have B. of their own, in addition to what they held in right of the church. The Anglo-Saxon kings had private estates of B., and these estates did not merge in the crown, but were devisable by will, gift, or sale, and transmissible by inheritance, in the same manner as B. by a subject. (Kerr's *Blackstone*, vol. ii. p. 88; *An Inquiry into the Rise and Growth of the Royal Prerogative in England*, by John Allen, pp. 143–151; Wharton's *Law Dictionary*, 2d ed., under *Bockland*.)

BÖCKLIN, ARNOLD, b. 1827; a Swiss painter; a professor of landscape painting in Weimar academy in 1860–62. He is noted for success in ideal scenery, and among his pictures are "Amazons Hunting in a Forest," "A Panic," etc.

BODE, THE BARONS DE, a family of doubtful nationality, best known in England in connection with a claim for indemnity frequently brought before parliament. The first member of the family connected with England was CHARLES A. L. F. DE B., a baron of the Holy Roman empire. He was born at Neuhof, in Germany, in 1741, and became an officer in the regiment of Nassau, which, although in the service of France, consisted exclusively of Germans. The baron had landed property in Germany, and remained German when he married a Miss Kennersley, an Englishwoman. Two years afterwards, a son was born of the marriage at Locksley, in Staffordshire, named CLEMENT J. P. P. de B., who returned when a child with his parents to the continent. In 1787, baron Charles purchased an estate in Lower Alsace, held under German feudal tenures, in terms of the treaty of Münster, and thither he went to reside. The revolution, however, broke out, and in 1791, the baron considered it prudent publicly to surrender his estates to his son. Two years later, the family was obliged to emigrate, and the property was confiscated. After leaving France, baron Charles bought a fief held of the archbishop of Cologne, and he died a German in 1797. Clement, his son, became an officer in the Russian artillery, married a Russian, and, with his regiment, entered Paris in 1814. After the peace, conventions were entered into, under which British residents who had suffered during the revolution by confiscation were to be indemnified. A large sum was handed over by France to England, to be divided among the claimants, one of whom was baron Clement. The fact that he had been invested as proprietor of the estate in Alsace at the time of confiscation, that his mother was English, and that he had been born in England, secured at first a recognition of his claim to the extent of making it an item of the calculation for fixing the amount of the indemnity; but it was afterwards repudiated, on the ground, that baron Clement was not an English subject at the time of confiscation, and that he had sustained no loss through his connection with England. He died in 1846. His son, BARON CLEMENT A. G. P. L., took out letters of administration to his father, and prosecuted the claim of his family; without, however, any success. He petitioned the house of commons in 1852, and his case was fully discussed. See J. Hodgkin's *Case of the Baron de B. in its Present Aspect* (1860). Baron Clement is naturalized as a British subject, and his married an Englishwoman. He has acquired reputation as an eastern traveler, and is the translator of *Bokhara, its Emir and People*, from the Russian of Khanikoff (1845), and the author of *Travels in Lauristan and Arabistan* (1845), and of an interesting *Account of Hilly Daghestan and the Lesghi Tribes of the Eastern Caucasus*, referred to with approbation by earl de Grey in his address to the geographical society in 1860.

BODE, JOHANN ELERT, 1741–1826; an eminent German astronomer. When a boy he made astronomical observations from the garret of his father's house, with a telescope constructed by himself, and at the age of 18 calculated an eclipse of the sun. The next year he wrote on the solar eclipse of Aug. 5, and an elementary treatise on astronomy which was especially successful. In 1774, he commenced the *Astronomical Year-Book*, which is still continued. But his fame rests chiefly on the *Uranographia*, published in 1801, in which he gives observations on 17,240 stars, or 12,000 more than can be found in any previous charts.

Bode reproduced the statement of the relations of the planetary distances, previously made known by Titius of Wittenberg, but afterwards called "Bode's law" It assumes the series of numbers, 0, 3, 6, 12, 24, 48, 96, etc., each term after the second being twice the preceding term; to each term 4 is added, producing the series, 4, 7, 10, 14, 28, 56, 100, etc., whose terms correspond roughly to the distances of the planets from the sun, when stated in 10 millions of miles, thus: Mercury, 3.5; Venus, 6.8; Earth, 9.1; Mars, 13.9; Minor planets, 22–34.9, average 28.4; Jupiter, 47.6; Saturn, 87.2; Uranus, 175.4. Thus far the approximation is tolerably close, but the next terms are far apart. The number of the series is 388, while the corresponding planetary distance is but 274.6.

The "law" needs, first, a demonstration of its causes; second, an explanation of its discrepancies; then it should be called the law of Titius.

BO'DEN-SEE. See CONSTANCE, LAKE OF.

BO'DENSTEDT, FRIEDRICH MARTIN, b. 1819; when young, a private tutor in the family of prince Galitzin. He subsequently traveled in the Crimea, Greece, Asia Minor, and the Caucasus, publishing *The People of the Caucasus*, and *A Thousand and One Days in the East*. After some experience in journalism he became professor in the university of Munich, lecturing on Slavonic languages and literature. In 1851, he published the *Songs of Mirza Schaffy*, supposed to have been translations from the Persian, but really original, which attained remarkable success. He is the author of various other poems, and assisted in German translations of Shakespeare.

BODE'S LAW, an arithmetical relation subsisting between the distances of the planets from the sun. It may be thus stated: Write, in the first instance, a row of fours, and under these place a geometrical series beginning with 3, and increasing by the ratio 2, putting the 3 under the second 4; and by addition we have the series 4, 7, 10, etc., which gives nearly the relative distances of the planets from the sun.

4	4	4	4	4	4	4	4	4
	3	6	12	24	48	96	192	384
4	7	10	16	28	52	100	196	388

Thus, if 10 be taken as the distance of the earth from the sun, 4 will give that of Mercury, 7 that of Venus, and so forth. The actual relative distances are as follow, making 10 the distance of the earth—

Mercury.	Venus.	Earth.	Mars.	Asteroids.	Jupiter.	Saturn.	Uranus.	Neptune.
3.9	7.2	10	15.2	27.4	52	95.4	192	300

Close as is the correspondence between the law and the actual distances, no physical reason has been given to account for it, although there is little room for doubt that such exists. B. L., therefore, in the present state of science, is termed empirical. Kepler was the first to perceive the law, and Bode argued from it that a planet might be found between Mars and Jupiter, to fill up the gap that existed at the time in the series. The discovery of the asteroids has proved the correctness of this prediction. The greatest deviation from the law is seen in the case of Neptune; but if we were acquainted with the principles from which the law proceeds, we might also be able to account for the discrepancy. Similar relations, though expressed in different numbers, are found to subsist in the distances of the satellites of Jupiter and Saturn from their primaries.

BODIN, JEAN, 1530–96; a French lawyer and politician, author of a number of philosophical works. His greatest effort was the *Six Books of the Republic*, the first elaborate attempt in modern times to construct a system of political science. Only four years afterwards, as if to prove that great minds have great weaknesses, he wrote a work expressing the fullest belief in demonology and sorcery. The duke of Alençon gave B. many preferments, and took him with him when he went to London to solicit the hand of queen Elizabeth. B. was much worried between the Protestants and the league, and was accused of being on both sides. That he was disposed to liberality is shown in a posthumous work in the form of a dialogue, in which a Jew, a Mohammedan, a Lutheran, a Zuinglian, a Roman Catholic, an Epicurean, and a Theist take part. The conclusion to which they all come is that they will live together in charity and toleration, and cease from further disputations about religion.

BOD'KIN, an instrument used by women of antiquity to fasten up their hair behind. It was the method commonly adopted by the priests of Cybele, as well as by the female characters in Greek tragedy, the B. being highly ornamented. Silver bodkins are still worn in a similar way by the peasant girls of Naples. The term B. is also applied to a sharp-pointed instrument for piercing holes in cloth, and it was at one time a very common name for a dagger.

BO'DLE, a ancient copper coin in Scotland, in value the sixth of a penny sterling. According to Jamieson, the B. is said to have been so called from a mint-master of the name of *Bothwell*.

BODLEY, Sir THOMAS, the restorer of the library originally established at Oxford by Humphrey, duke of Gloucester, was b. at Exeter, Mar. 2, 1544. His family being forced to flee from England during the persecutions of Mary, settled at Geneva, where B. studied languages and divinity under the most distinguished professors of that city. On the accession of Elizabeth, he returned to England, and completed his studies at Oxford, where he took the degree of M.A., and was afterwards elected a proctor. After traveling some time abroad, he was employed by the queen in diplomatic missions to Denmark, France, and Holland, and returned to his favorite city, Oxford, in 1597, where he devoted himself to literature, especially to the extension of the university library, now called the Bodleyan (q.v.), in B.'s honor. In collecting rare and valuable books from many parts of Europe, B. expended a very large sum, and also left an estate for salaries to officers, repair of the library, and purchase of books. He was knighted by

king James, and died at Oxford, Jan. 28, 1612. B.'s autobiography, extending to the year 1609, together with a collection of his letters, has been published under the title *Reliquiæ Bodleianæ* (Lond. 1703).

BODLEY'AN or BODLEI'AN **LIBRARY**, the public library of Oxford university, restored by sir Thomas Bodley (q.v.) in 1597, his first act being the presentation of a large collection of valuable books, purchased on the continent at an expense of £10,000. Through his influence and noble example, the library was speedily enriched by numerous other important contributions. Among the earliest subsequent benefactors of the B. L., which was opened in 1602, with a well-assorted collection of about 3000 volumes, were the earl of Pembroke, who presented it with 250 volumes of valuable Greek MSS.; sir Thomas Roe; sir Kenelm Digby; and archbishop Laud, who made it a magnificent donation of 1300 MSS. in more than twenty different languages. Upwards of 8000 volumes of the library of the famous John Selden (q.v.) went to the Bodleyan library. Gen. Fairfax presented the library with many MSS., among which was Roger Dodsworth's collection of 160 volumes on English history. During the present century, the most important bequests have been the collections of Richard Gough, on British topography and Saxon and northern literature; of Edmund Malone, the editor of Shakespeare; and of Francis Douce; also a sum of £40,000, by the Rev. Robert Mason, the interest to be expended on books. By purchase, the library acquired some magnificent collections of Oriental, Greek, Latin, and Hebrew books and MSS. The B. L. is particularly rich in biblical codices, rabbinical literature, and materials for British history. By the copyright act, it is entitled to a copy of every book printed in the United Kingdom. The number of volumes it possesses is estimated at about 300,000, in addition to 20,000 to 30,000 in manuscript. The first catalogue of the printed books was published by the first librarian, Dr. James, in 1600; the last, nearly two centuries and a half later (in 1843), in 3 vols., by Dr. Bandinel, the eleventh who held the office since the institution of the library. In the interval, several catalogues of various departments of the library were published; and a supplemental volume was added by Dr. Bandinel in 1850. By statutes drawn up for the government of the library by sir Thomas Bodley, it was decreed that the vice-chancellor, the proctors, and the regius professors of divinity, law, medicine, Hebrew, and Greek, should be visitors and curators; a statute passed in 1856 added "five more residents to be elected by congregation for ten years, if continuing to reside, and to be re-eligible." Members of the university who have taken a degree are admitted to the use of the library—a small addition on the matriculation fees, and an annual payment, being charged for the privilege. Literary men, properly recommended, are allowed to make extracts from the works in the library, which is open between Lady-day and Michaelmas from nine o'clock in the morning till four in the afternoon, and during the other half of the year from ten to three. It is shut during certain holidays, and for visitation purposes, in the aggregate about 34 days in the year, besides Sundays. Since 1856, a reading-room, open throughout the year from ten o'clock in the morning to ten in the evening, has been attached to the library.

BODMANN (ancient *Bodami Castrum*), a village of Baden, at the mouth of the Stockach, on lake Constance, with ruins of a castle, formerly the residence of the lieutenants (*botemann* or *bodmanno*, messenger or *legatus*) of the Carlovingian kings; hence the German name of the lake Bodman-see, or Boden-see. Pop. 900.

BODMER, JOH. JAK., a German poet and *littérateur*, was b. at Greifensee, near Zurich, 19th July, 1698. The study of the Greek and Latin writers, together with the English, French, and Italian masters, having convinced him of the poverty and tastelessness of existing German literature, he resolved to attempt a reformation. Accordingly, in 1721, along with a few other young scholars, he commenced a critical periodical, entitled *Discurse der Maler*, in which the living poets were sharply handled. After 1740, when B. published a treatise on *The Wonderful in Poetry*, a literary war broke out between him and Gottsched, which was long waged with great bitterness; yet it was not without fruits, inasmuch as it partly prepared the way for the Augustan epoch of German literature. B. died at Zurich (in the university of which he had held the chair of history for 50 years), 2d Jan., 1783. As an author, he was marked by inexhaustible activity, but his poems, dramas, and translations have no vigor or originality. His best known production is the *Noachide* (Zurich, 1752). He did greater service to literature by republishing the old German poets, the Minnesingers, and a part of the *Nibelungen*, as also by his numerous critical writings.

BODMIN, the co. t. of Cornwall, in the middle of the county, 26 m. n.n.w. of Plymouth. It is situated partly in a valley and partly on the side of a hill, and consists principally of one street a mile long. Its chief trade is in cattle and sheep. Among the more important recent buildings are a market house, the county jail, and the new Cornwall lunatic asylum. B. arose in a priory founded in the 10th c., and was long an important place, having, besides the priory, a cathedral and 13 churches. The priory was once the property of Thomas Sternhold, one of the translators of the Psalms of David into English meter. Fifteen hundred persons in B. are said to have died of the pestilence in 1351. Pop. '71, 6758. It returns one member to parliament.

BODO'NI, GIAMBATTISTA, a distinguished type-cutter and printer, b. at Saluzzo, in Sardinia, 1740; went to Rome in 1758, where he secured an engagement as compositor

in the printing-office of the propaganda, and where he remained till the death of his patron, Abbate Ruggieri, in 1762, or, according to others, 1766. In 1768, he went to Parma, where he published several specimens of his workmanship; among others—on occasion of the marriage of the prince of Piedmont with the princess Clotilde of France—*Epithalamia Exoticis Linguibus Reddita*, which exhibited the alphabets of 25 languages. In 1789, the duke of Parma made him superintendent of his private printing establishment, and from this press he sent forth his edition of the *Iliad* (3 vols. 1808), dedicated to Napoleon. It is a splendid specimen of typography; but the correctness of the text is by no means equal to the beauty of the printing. His editions of Virgil (2 vols. 1793), and several Greek, Latin, Italian, and French classics, as also his Lord's prayer in 155 languages, are admired for their elegance. He died at Parma, 1813.

BODY, HUMAN, will be treated of under the names of the several organs and functions. For BODY-SNATCHING, see ANATOMY (in law).

BODY COLOR, a term which, in oil painting, is applied to the opaque coloring produced by certain modes of combining and mixing the pigments. When, in water-color painting, pigments are laid on thickly, and mixed with white, to render them opaque, instead of in tints and washes, the works are said to be executed in body color.

BODY OF A CHURCH, more commonly called the *nave* (q.v.), though this latter term is sometimes employed to include the aisle (q.v.), is also known as the main or middle aisle.

BODY'S ISLAND, the sand strip between Roanoke and Albemarle sounds, n. of Oregon inlet, in Dare co., N. C. There is a light on the island, 156 ft. above tide, in 35° 48′ n., and 75° 33′ west.

BOECE, or, more properly, **BOYCE,** HECTOR, a distinguished Scottish historian, was b. of an old family, about 1465, at Dundee. He completed his education at Montague college, in the university of Paris, and in 1497, was appointed a professor of philosophy. Among other learned men whose friendship he here acquired was Erasmus. About the beginning of the 16th c., he was invited by bishop Elphinstone to preside over the university newly founded by him at Aberdeen. B. accepted the office after some natural hesitation, the yearly salary being 40 merks, or about £2 4*s.* 6*d.* sterling. The value of money, however, it has to be remembered, was immensely greater then than now, and the learned principal was at the same time made a canon of the cathedral, and chaplain of St. Ninian. There is every reason to suppose that he discharged his duties with high success. In 1522, he published his lives, in Latin, of the bishops of Mortlach and Aberdeen. This work, a great part of which is occupied with the life of his excellent patron, bishop Elphinstone, was reprinted by the Bannatyne club in 1825. Five years later, B. published the *History of Scotland*, on which his fame chiefly rests, a work which, though proved to contain a large amount of fiction, is worthy of the commendation it has received even on the score of style. The author was rewarded by the king with a pension of £50 Scots, until he should be promoted to a benefice of 100 merks, which appears to have occurred in 1534. B. died two years later.

BŒHME'RIA, a genus of plants of the natural order *urticeæ*, included, until recently, in the genus *urtica*, or nettle (q.v.). The fibers of a number of species are used for making ropes, twine, nets, sewing-thread, and cloth, and some of them appear likely to acquire much economical and commercial importance. *B. nivea* (formerly *urtica nivea*) has been recently ascertained to yield great part of the fiber employed in China in the manufacture of the beautiful fabric known as *China-grass* (q.v.) cloth. It is a perennial herbaceous plant, with broad ovate leaves, which are white and downy beneath, and is destitute of the stinging powers of the nettles. It is carefully cultivated by the Chinese, by whom it is called *tchou ma*. It is propagated either by seeds or by parting the roots. It loves shade and moisture. Three crops are obtained in the season, new shoots springing up after it has been cut. Great attention is bestowed upon the preparation of the fiber; the stems are sometimes tied in little sheaves, and instead of being steeped are placed on the roof of a house, to be moistened by the dew, and dried by the sun, but are carefully preserved from rain, which would blacken them; and in rainy weather they are placed under cover in a current of air. Another plan is to steep the separated fibers for a night in a pan of water, and sometimes they are steeped in water containing the ashes of mulberry-wood. A patent was obtained in Britain, in 1849, for the preparation of this fiber, by boiling the stems in an alkaline solution, after previously steeping them for 24 hours in water of the temperature of 90° F., then thoroughly washing with pure water, and drying in a current of high pressure steam.—It seems now to be ascertained that this is the same plant which Dr. Roxburgh strongly recommended to attention about the beginning of the 19th c. under the name of *urtica tenacissima*, and of which the court of directors of the East India company, in 1816, declared the fiber to be "stronger than Russian hemp of the best description," and to have been "brought to a thread, preferable to the best material in Europe for Brussels lace." It may well be regarded as curious that, after this, it was lost sight of for a considerable time, although the commendation bestowed upon it is found not to have been exaggerated. The plant grows naturally, and is cultivated not only in China but in Sumatra, Siam, Burmah, Assam, and other parts of the east. The fiber is called *caloee* in Sumatra, *ramee* by the

Malays, and *rheea* in Assam.—*B. candicans* and *B. utilis*, from which a fine silky fiber is obtained in Java, are either varieties of this or nearly allied species.—*B. frutescens* is another important species, common in Nepaul, Sikkim, and other parts of the Himalaya, to an elevation of 3000 ft. above the sea. It is not cultivated, but often overruns abandoned fields. It grows to a height of 6 or 8 ft., and varies from the thickness of a quill to that of the thumb. The leaves are serrated, dark-green above, silvery-white below, not stinging. The plant is cut down for use when the seed is formed, the bark is then peeled off, dried in the sun for a few days, boiled with wood ashes for four or five hours, and beaten with a mallet to separate the fibers, which are called *poöah* or *poee*, and also *kienki* or *yenki*. When properly prepared, the fiber is quite equal to the best European flax.—The fibers of a number of coarser species are employed in different parts of the East Indies for making ropes. See Royle's *Fibrous Plants of India*.

BŒHME'RIA. The China grass-plant, *B. nivea*, has been recently introduced into cultivation in some of the southern parts of the United States, under its Malay name of *ramee*. It succeeds well, and the results as to produce of fiber have proved very encouraging.

BŒO'TIA, one of the ancient political divisions of Greece, was bounded on the n. and n.w. by Locris and Phocis, on the e. by the Eubœan channel, on the s. by Attica and Megaris, and on the w. by the Corinthian gulf. B. had a surface estimated at 1120 sq. miles. The plains inclosed on the s. by Mts. Cithæron and Parnes, on the w. by Mt. Helicon, on the n. by the slopes of Mt. Parnassus and the Opuntian Mts., fall naturally into three divisions—the basin of the lake Copais, now called Topolias, that of the Asopus, and the coast-district on the Crissæan sea. The principal stream was anciently called the Cephissus. It entered the country from Phocis at Chæronea; and in the spring, when it was swollen by innumerable torrents, almost converted the Copaic plain into a lake. There were several natural channels for the outlet of the waters that congregated in this plain, but they were not sufficient to carry off the whole surplus, and the surrounding country was in consequence frequently deluged. In order to guard against this inundation, two tunnels had been cut in the rock for the discharge of the water. One of these tunnels which carried the water to Upper Larymna—where it emerged in a natural outlet after a subterraneous course of nearly 4 m., whence it flowed above ground a mile and a half to the sea—was no less than 4 m. in length, with about 20 vertical shafts let down into it, some of which were from 100 to 150 feet deep. The other tunnel, which united the Copais lake with that of Hylica, was much shorter, but still an extensive and striking work. The date of these gigantic engineering undertakings is not precisely known, but they are generally attributed to the Minyæ or Orchomenus. B. was in ancient times very productive of marble, potters' earth, and iron, besides abounding in corn and fruits; and it was also particularly celebrated for flute-reeds. The earliest inhabitants belonged to different races, the two most powerful of which were the Minyæ and Cadmeans or Cadmeones; but were at an early date (about 60 years after the Trojan war, according to Thucydides) in part dislodged by the Bœotians, an Æolian people who were driven from Thessaly, and in part incorporated with them. The Bœotians excelled as cultivators of the soil, and were gallant soldiers both on foot and horseback; but they were rude, unsociable, and took little part in the gradual refinement of manners and intellectual development of the rest of Greece, so that the name became proverbial for illiteral dullness. This was usually ascribed to their thick damp atmosphere. Yet there have not been wanting amongst them eminent generals, as Epaminondas; and poets and historians, as Hesiod, Pindar, Corinna, Plutarch, etc. The greater cities, of which the number was about fourteen, Thebes, Haliartus, Thespiæ, etc., with their territories, formed the Bœotian League. At the head of this was an archon, and next to him a council which was composed of four persons, and had its head-quarters in Thebes. The executive authority was intrusted to Bœotarchs, who were elected in popular assemblies of the separate states, and could only hold office for one year. Of this league, a shadow still remained down to the times of the empire; but after the battle of Chæronea, in which Philip established the Macedonian throne on the ruins of Grecian liberty, the political importance of the country declined so rapidly, that about 30 B.C. only two cities, Tanagra and Thespiæ, were of any consideration.—Along with Attica, B. now forms one of the "nomarchies" of the kingdom of Greece.

BOERHAAVE, HERMANN, the most celebrated physician of the 18th c., was b. at Voorhout, near Leyden, Dec. 13, 1668. In 1682, he went to Leyden, with the intention of becoming a clergyman, and there studied Greek, Latin, Hebrew, Chaldee, history, ecclesiastical and secular, and mathematics. In 1689, B. was made doctor of philosophy, and in 1690 began the study of medicine, reading carefully Hippocrates among the ancients, and Sydenham among the moderns. Though mainly self-educated in medicine —as in chemistry and botany—he gained his doctor's degree at Harderwyck, 1693, and returned to Leyden, where, in 1701, having abandoned theology, he was appointed lecturer on the theory of medicine, and in his inaugural lecture recommended to the students the ancient method of Hippocrates in medicine; but in 1703 his views had become greatly enlarged. He saw the necessity of *a-priori* speculations, as well as of the Hippocratic method of simple observation, and elaborated various mechanical and chemical hypotheses to explain the diseases of the body, especially in the case of the fluids. In 1709, he was elected professor of medicine and botany in the place of Hotton. About this

time, he published the two works on which his great fame chiefly rests: *Institutiones Medicæ in Usus Annuæ Exercitationis Domesticos* (Leyd. 1708), and *Aphorismi de Cognoscendis et Curandis Morbis, in Usum Doctrinæ Medicinæ* (Leyd. 1709), both of which went through numerous editions, and were translated into various European languages, and also into Arabic. In the first work—a model of comprehensive and methodical learning—he gives a complete outline of his system, including a history of the art of medicine, an account of the preliminary knowledge necessary to a physician, and a description of the parts and functions of the body, the signs of health and disease, etc.; in the second, he gives a classification of diseases, with their causes, modes of treatment, etc. B. also rendered important services to botany. One of his best lectures is that delivered on his resignation of the office of rector of the university, *De Comparando Certo in Physicis*. To combine practice with theory, he caused a hospital to be opened, where he gave clinical instructions to his pupils. Though so industrious in his own profession, he undertook, in 1718, after Lemort's death, the professorship of chemistry, and published in 1724 his *Elementa Chemiæ*, a work which did much to render this science clear and intelligible; and although now entirely superseded by more advanced researches, one that will always occupy a high place in the history of chemistry. His fame had meanwhile rapidly increased. Patients from all parts of Europe came to consult him. Peter the great of Russia visited him; and it is even said that a Chinese mandarin sent him a letter, addressed "HERR BOERHAAVE, celebrated physician, Europe." He was a member of most of the learned academies of the day. He died Sept. 23, 1738, having realized from his profession a fortune of two millions of florins.—Burton, *Account of the Life and Writings of B.* (2 vols., Lond. 1743); Johnson, *Life of B.* (Lond. 1834).

BOERHAA'VIA. See NYCTAGINACEÆ.

BOERS (*Dutch*, agriculturists, farmers), the name applied to the Dutch colonists of the cape of Good Hope who are engaged in agriculture and the care of cattle. The B., generally, according to Dr. Livingstone, "are a sober, industrious, and most hospitable body of peasantry." Very different, however, are certain of their numbers who have fled from English law, on various pretexts, and formed themselves into a republic in the Cashan mountains. Coming "with the prestige of white men and deliverers" from the cruelty of Kaffir chiefs, they were received by the Betjuans gladly, who, however, soon found out that their new friends were much less desirable as neighbors than their old enemies. The B. force even those tribes of the Betjuans who are most friendly towards them to perform all kinds of field labor for nothing; and not only this, but they also compel them to find their own implements of labor and their own food. They steal domestic servants from the more hostile tribes in the most cowardly and cold-blooded way imaginable. The plan of operation is thus described by Dr. Livingstone: "One or two friendly tribes are forced to accompany a party of mounted Boers, and these expeditions can be got up only in the winter, when horses may be used without danger of being lost by disease. When they reach the tribe to be attacked, the friendly natives are ranged in front, to form, as they say, "a shield;" the Boers then coolly fire over their heads, till the devoted people flee, and leave cattle, wives, and children to the captors. This was done in nine cases, during my residence in the interior, and on no occasion was a drop of Boer's blood shed." And yet these B. proudly boast themselves "Christian!" They have an immense contempt for the ignorance of the natives, and told Dr. Livingstone that he might as well teach baboons as Africans. They, however, declined a test which the missionary proposed—viz., to be examined whether they or his native attendants could read best. In his opinion, they are quite as degraded as the blacks whom they despise. See ORANGE RIVER FREE STATE.

BOË'THIUS, ANICIUS MANLIUS SEVERINUS (to which a few MSS. add *Torquatus*), a Roman statesman and philosopher, was b. between 470 and 475 A.D. The family to which he belonged had been distinguished both for its wealth and dignity for two centuries. His own father held the office of consul, but dying while B. was still a boy, the latter was brought up under the care of Festus, Symmachus, and other honorable Romans. He studied with sincere enthusiasm philosophy, mathematics, and poetry, translated and elucidated with laborious care the writings of Aristotle, and of the old mathematicians Euclid, Archimedes, Ptolemæus, and others; but the story of his 18 years' stay at Athens is entirely unhistorical. B. soon attracted notice; he became a patrician before the usual age, a consul in 510, and also *princeps senatus*. Having, moreover, gained the esteem and confidence of Theodoric, king of the Goths, who had fixed the seat of his government at Rome in the year 500, he was appointed by that monarch *magister officiorum* in his court. His influence was invariably exercised for the good of Italy, and his countrymen owed it to him that the Gothic rule was so little oppressive. His good fortune culminated in the prosperity of his two sons, who were made consuls in 522. But his bold uprightness of conduct, springing from what seemed to have been the essential characteristics of the man—viz., a strong faith in the truth of his philosophic ethics, and a courage to regulate his official conduct by them—at last brought down upon his head the unscrupulous vengeance of those whom he had checked in their oppressions, and provoked by his virtues. He was accused of treasonable designs against Theodoric; and the king, having become despondent and distrustful in his old age, was induced to listen to the charges. B. was stripped of his dignities, his property was confiscated, and

he himself, after having been imprisoned for some time at Pavia; was executed in 524 or 526; according to one account, with circumstances of horrible cruelty. During his imprisonment, B. wrote his famous *De Consolatione Philosophiæ*, divided into 5 books, and composed in the form of a dialogue, in which B. himself holds a conversation with Philosophy, who shows him the mutability of all earthly fortune, and the insecurity of everything save virtue. The work is composed in a style which happily imitates the best models of the Augustan age, and the frequent fragments of poetry which are interspersed throughout the dialogue are distinguished by their truthfulness of feeling and metrical accuracy. The *Consolatio* is piously *theistic* in its langnage, but affords no indication that B. was a Christian; and if the doctrinal treatises ascribed to him are, as the acutest criticism maintains, not genuine, we must class him in religion rather with Marcus Aurelius than with his alleged friend, St. Benedict. He was the last Roman writer of any mark who understood the Greek language and literature. During the middle ages, he was regarded with profound reverence, as the *Augustine* of philosophy, but on the introduetion of the Aristotelian metaphysics in the 13th c., his reputation gradually sank. The first edition of B.'s entire works appeared at Venice, 1491–92; a more correct one at Basel, 1570. The oldest edition of the *Consolatio* is that published at Nürnberg, 1473, but many manuscript translations into various languages had appeared long before the invention of printing. Among these may be mentioned that by king Alfred into Anglo-Saxon.

BŒUF, Bayou, an overflow stream in Arkansas and Louisiana, fed in time of inundation by the Mississippi. It unites with Washita river, and at high water offers 100 m. of steamboat navigation.

BOG, land covered with peat, the spongy texture of which, containing water, converts it into a kind of quagmire. The term Peat-bog is sometimes employed as more perfectly distinctive of the true B. from every other kind of swamp or morass; the term Peat-moss is also sometimes employed, particularly in Scotland, and even simply Moss. The word B. is of Irish origin, being from a Gael root signifying a bobbing, quaking motion.

Bogs of great extent exist in some of the northern parts of the world. A very considerable part of the surface of Ireland is occupied with them. The B. of Allen (see Allen, Bog of) is the most extensive in the British islands, although its continuity is not altogether unbroken, strips of arable land intersecting it here and there. The Solway moss (q.v.), on the western borders of England and Scotland, is about 7 m. in circumference, Chatmoss (q.v.), in Lancashire, famous for the engineering difficulties which it presented to the formation of the first great English railway, is 12 sq.m. in extent. The swamps of the e. of England are in general not peat-bogs, but consist chiefly of soft mud or silt.

The general surface of a B. is always nearly level, but it is usually varied with rushy tussocks rising above the rest, and having a rather firmer soil. By the continued growth of peat, the surface of a B. is gradually elevated; that of Chatmoss, for example, rises above the level of the surrounding country, having a gradual slope of 30 or 40 ft. from the center to the solid land on all ides. In rainy weather, it sensibly swells, the spongy mass imbibing water, whilst the mosses and other growing plants on the surface prevent evaporation. Occasionally, the quantity of water becoming excessive, a B. *bursts*, and pours a terrible deluge down the course of a stream, causing great devastation, not only by the force of its torrent, but by the enormous quantities of peat which it deposits upon meadows and cultivated fields, as has recently happened in some memorable instances in Ireland. The depth of a B. is sometimes more than 40 feet. The spongy mass of which it is formed shakes on the least pressure. Sometimes it is impossible to traverse it; in other cases, it is possible only for those who are well accustomed to it, a false step being a plunge into a quagmire, in which a man sinks as in a quicksand. Safety is sometimes insured by "pattens"—boards fastened upon the soles of the feet—a method which Mr. Roscoe of Liverpool, in his extensive operations for reclaiming land from Chatmoss, employed also to enable horses to work upon its surface. It was not the least remarkable triumph of the genius of Stephenson, to extend the same principle to the support of the railway. Tradition reports that at the battle of Solway, in 1542, a fugitive troop of horse plunged into the moss, which instantly closed upon them; and in the end of the 18th c., this tradition was confirmed by the discovery, made by peat-digging, of a man and horse in complete armor.

One of the remarkable phenomena of peat-bogs is the frequent presence of roots and fallen trunks of trees, in a good state of preservation, many feet below the surface. From the black bog-oak of Ireland, various small fancy articles are manufactured. The circumstance of trees being found imbedded in bogs, leads to the conclusion that in many instances these morasses originated in the decay or partial destruction of ancient forests. This subject, however, along with all that relates to the origin and nature of bogs, will be treated in the article Peat. It may be proper here to mention that there is a popular division of bogs into two classes—*red bogs* and *black bogs;* the decomposition of the vegetable matter in the former being less perfect, and the substance, consequently, more fibrous and light than in the latter. There is indeed no precise line of distinction, and all intermediate conditions occur. The most extensive bogs are red bogs, and they

are said to cover 1,500,000 acres in Ireland. Black bogs, although comparatively of small extent, are more numerous, particularly in elevated districts, for which reason they are sometimes called *mountain bogs*. The depth of red bogs is usually much greater than that of black bogs.

The conversion of bogs into good pasture or arable land, is a subject of national importance. There can be no doubt that much of the land now occupied by B. is capable of being rendered very productive, whilst the effects of extensive bogs upon the climate are always injurious. The reclaiming of shallow mountain bogs is comparatively easy, and in some cases it is effected by a very simple and inexpensive drainage, and by throwing them at once under cultivation in a manner analogous to that known in Ireland as the *lazy-bed* method of planting potatoes—the soil upon which the B. rests being partially digged up and thrown over its surface. Great difficulties, however, attend the reclaiming of red bogs. It has unfortunately happened, particularly in Ireland, that the tenures of land, and the want of capital on the part of the owners of estates, have formed the most insuperable of all obstacles to improvements of this kind, which, however, have been carried on to no inconsiderable extent since the middle of the 18th c., and have in general proved highly remunerative. A chief difficulty, in some cases, is caused by the low situation of the B., and the want of *fall* for drainage. Another great difficulty is presented by the spongy substance of red bogs being extremely retentive of water, so that a deep ditch only drains a very narrow strip on each side of it. A difficulty has been also found in disposing of the peat, where a good soil being known to exist below, it has been attempted to reclaim land by removing the peat instead of draining it and converting its own surface into soil. To some extent, in such cases, the peat is advantageously disposed of for fuel, or to be used as a species of manure for other soils; but the demand for these purposes is often insufficient for any other than a very slow process of improvement in an extensive B. The peat is, therefore, sometimes, by various means, floated off, as in the long-continued operations at Blair-Drummond, on the banks of the Forth, the results of which have for many years formed a peculiar feature on the shores and in the bays of the upper part of the firth of Forth. But when a similar method was more recently introduced in an extensive moss in the low lands of Renfrewshire, the Clyde trustees interposed to prevent it, in the interests of the navigation of the river. A portion of the peat, taken from the upper surface, is not unfrequently burned in heaps upon the spot, the ashes becoming a manure, and assisting in the formation of a soil.

Of course, the first essential in the reclaiming of bogs is drainage. The method of effecting this must be varied according to circumstances; but very frequently, after a general outlet with sufficient fall has been secured, wide open drains are cut, by which the bog is divided into strips, which again are traversed and subdivided by smaller drains. When these drains begin to serve their purpose, the surface of the bog sinks, and their depth is reduced; they are then often deepened, and at last a permanent system of covered drains emptying themselves into open ditches is thus formed, and fits the land for all the purposes of agriculture. It is, however, often plowed before this state of things is attained, the plow-horses being shod with the *pattens* already mentioned, and socks and coulters of unusual sharpness being employed for the cutting of the bog. Various implements have also been devised for cutting the moss, to facilitate cultivation. Lime, calcareous sand, clay, and other manures are applied, according to circumstances, to promote the conversion of the peat into useful soil. Sometimes the first crop taken from the plowed bog is a crop of oats; sometimes it is found preferable to begin with rape, turnip, or the like. In some places in the north of Ireland, florin grass (see BENT GRASS) has been sown on bogs in process of being reclaimed, and enormous crops have been obtained.—See WASTE LANDS.

BO'GAN, or NEW-YEAR RIVER, the *Allan Water* of Oxley, an interior stream of east Australia, joins the Darling after a generally n.w. course of more than 300 m., about lat. 30° s., and long. 146° east. Its source is in the Harvey range, about lat. 33° s., and long. 148° 30′ east.

BOGARDUS, EVERARDUS, a minister of the early Dutch Reformed church in New Amsterdam. In 1638 he married Anneke Jans, a widow, who owned 60 acres of land in what is now an important business part of New York. The farm subsequently came into possession of Trinity church, and has been the occasion of many law suits for recovery by the heirs of Bogardus; but they are all in vain, the church's title being complete. In 1647, Bogardus sailed for Holland to answer certain charges made by his ecclesiastical superiors, but lost his life by shipwreck in Bristol channel.

BOGARDUS, JAMES, b. New York, 1800; an inventor. Among his notable works are: the eight day, three wheeled, chronometer clock, and several other improvements in time pieces; the ring-flyer for spinning cotton; the eccentric mill, in which both stones run the same way but with different speed; an engraving machine; a transfer machine for producing bank-note plates from separate dies; the first dry gas meter; the first pencil-case without a slot; a medallion engraving machine; a machine for engine-turning; the accepted method for making stamps for penny postage; a machine for pressing glass; several machines for cutting and working India-rubber; a new horse-power; a dynamometer, and other contrivances of less importance. In 1847 he put up for his factory

a cast-iron building, the first one of that material ever erected. Soon afterwards he introduced wrought-iron beams.

BOG BUTTER, a very peculiar mineral substance, which is found in some of the bogs of Ireland. It is evidently of vegetable origin, and has been formed by the decomposition of the peat amidst which it is found. In composition and qualities it exhibits a general agreement with bitumen, asphalt, amber, and the other mineral resins; all of which are not improbably supposed to resemble it also in their origin, although perhaps it is the most recent of them all. It contains about 74 per cent. of carbon; its remaining constituents being oxygen and hydrogen in nearly equal proportions. In color and consistency, it much resembles butter, and at 124° F. it becomes liquid. It is not soluble in water, but is readily dissolved by alcohol.

BOGDANOVITCH, HIPPOLYTUS THEODOROVITCH, a distinguished Russian poet of the 18th c., was b. at Perevolotchna, Little Russia, in Dec., 1743. His fame rests entirely upon his poem, *Dushenka*, published in 1775. The story of Psyche forms the groundwork of the poem, which is characterized by a refined and graceful style, and vivacious playfulness of language. Its publication made him at once famous, as well as obtained for him the high favor of the court; but there can be no doubt that the popularity of the work was as much owing to the adventitious circumstances in which it was produced —nothing of the kind having been previously attempted in Russia—as to its intrinsic merits. B., though he wrote much afterwards, never equaled his first performance. He died in Jan., 1803.

BO'GEN, a t. of Bavaria, in the circle of Lower Bavaria, situated on the left bank of the Danube, about 6 m. e. of Straubing. It has extensive breweries, but is chiefly celebrated for its chapel, still a place of pilgrimage, built on a neighboring height. Here, according to tradition, a hollow stone image of the Virgin floated up by the river, remained stationary; and its miraculous arrival had the effect of converting a notorious robber chief, the ruins of whose castle now inclose the church. Innumerable pilgrims flocked to the image, including, at various times, three German emperors, and the monks grew very wealthy on their offerings. Pop. 1200.

BO'GENHAUSEN, a village in Bavaria, the seat of the royal observatory of Munich, 2 m. n.e. of that city. The observatory, one of the best in the world, is in 48° 8′ n., and 11° 36′ east.

BOGERMANN, JOHANN, who occupies a place in history as president of the far-famed synod of Dort, was b. in 1576, at the village of Oplewert, in Friesland. He took a violent part in the religious controversies which inflamed, with unwonted fire, the Dutch mind at the beginning of the 17th century. His hatred of Arminianism extended itself (as theological hatred generally does) to the persons who upheld it, and his zeal was on various occasions gratified by securing the punishment of those who had the misfortune to differ in opinion from him. He translated and recommended Beza's book on the *Capital Punishment of Heretics;* and about the year 1614, ventured to assail the great Grotius in a polemical treatise, which, along with most of the angry literature of the period, has properly perished. In 1618, B. was elected president of the synod of Dort; but his conduct there does not seem to have given satisfaction to the Frieslanders who had delegated him, for he was accused on his return of having exceeded his instructions. For one thing, however, B. deserves great credit, his translation of the Bible into the vernacular. Four other persons were associated with him in the task, but the translation of the Old Testament is chiefly B.'s work, and is characterized by taste, fidelity, and purity of language. It is still used in the Dutch churches. B. died in 1633, at Franeker, in the university of which he was primarius professor of divinity.

BOGGS, CHARLES STUART, b. N. J., 1811; rear-admiral in the U. S. navy, retired in 1873. He commanded the *Varuna* at the passage of the forts below New Orleans, and was specially praised by Farragut.

BOGHAZ' KIE'UI, KE'WEE, or KOI, a village of Asia Minor, vilayet of Kastamuni, 88 m. s.w. of Amasia. In its vicinity are the ruins of a magnificent temple, supposed to be that of Jupiter which Strabo mentions (lib. xii.). A perfect ground-plan of the building still remains; the length outside is 219 ft., the breadth 140 ft., while the cella measures 87 ft. by 65. There are several other ruins which seem to identify B. K. as the ancient *Tavium.*

BOGHEAD COAL, bituminous coal of Scotland, more valuable for making gas than for fuel. Named from the chief place of deposit, Boghead, Linlithgowshire.

BOG IRON ORE, a mineral of very variable composition, but regarded as consisting essentially of peroxide of iron and water; the peroxide of iron often amounts to about 60 per cent, the water to about 20. Phosphoric acid is usually present in quantities varying from 2 to 11 per cent. Silicic acid, alumina, oxide of manganese, and other substances, which seem accidentally present, make up the rest. B. I. O. occurs chiefly in alluvial soils, in bogs, meadows, lakes, etc. It is of a brown, yellowish-brown, or blackish brown color. Some of its varieties are earthy and friable, formed of dull dusty particles; some are in masses of an earthy fracture, often vesicular; and some more compact, with conchoidal fracture. It is abundant in some of the northern and western

islands of Scotland, and in the northern countries of Europe generally; also in North America. When smelted, it yields good iron. See IRON, ORES OF. From what source the iron in B. I. O. is derived, has often been a subject of discussion; but Ehrenberg appears to have determined that it proceeds from the shields of animalcules, and he regards the mineral itself as composed of incalculable multitudes of these shields. He found in the marshes about Berlin a substance of a deep-ochre yellow passing into red, which covered the bottom of the ditches, and which, when it had become dry after the evaporation of the water, appeared exactly like oxide of iron; but which under the microscope was found to consist of slender articulated threads, formed of the partly silicious and partly ferruginous shields of *Gaillonella ferruginea*.

BOG MOSS. See SPHAGNUM.

BOG'NOR BEDS. See LONDON CLAY.

BOGODOUKHOV', or BOHODUKHOV', a fortified t. of Russia, in the government of Kharkov, 29 m. n.w. of the city of that name. It is situated on the Merle—the chief industry of its population, which amounts to about 10,000, consisting in leather-dressing and boot-making. B. has also a considerable trade in cattle and hides.

BOGOMI'LI, a religious sect which came into notice in the 12th c., whose chief seat was in Thrace. They resembled the Paulicians and Kathari. Their name, which is derived from the Bulgarian *Bog*, "Lord," and *milui*, "have mercy," refers to the frequency of their prayers. The basis of their creed was as follows: Out of the eternal divine essence or being sprang two principles—Satanael and Logos; the former, at first good, afterwards rebelled, and created in opposition to the original spiritual universe a world of matter and human beings. These human beings, however, received from the Supreme Father a life-spirit; but this was kept in slavery by Satanael until the Logos or Christ came down from heaven, and assuming a phantom body, broke the power of the evil spirit, who was henceforth called only Satan. The B., like all similar sects, practiced a severe asceticism, despised images, and rejected the sacraments. Instead of baptism, they placed their hands, and an apocryphal gospel of St. John, on the head of the neophyte, singing at the same time the Lord's Prayer, which they repeated seven times during the day, and five times during the night. They accepted the whole of the New Testament, but of the Old Testament only the Psalms and Prophets, which they interpreted allegorically. In 1118, that vehement hater of heretics, Alexius Comnenus, burned their leader Basilius. Persecution, however, did not put an end to the B., and at the time of the Mohammedan conquest of Bosnia (16th c.), we find that the greatest number of the renegade Christians who embraced the religon of the conquerors belonged to this sect. There are some B. even at the present day.

BO'GOS, negroes living in the highlands n. of Abyssinia, believed to number about 10,000, and speaking the Belen and Tigre tongues. They profess Christianity, but have little knowledge of it, and are tributary to Abyssinia. Their country is rich in fine timber, fruits, and wild animals.

BOGOTA', more fully **SANTA FÉ DE BOGOTA'**, in South America, the federal capital of the United States of Colombia, formerly New Granada. It is situated within the limits of Cundinamarca, in lat. 4° 6′ n., and long. 78° 30′ w., on a table-land, which, at an elevation of 8694 ft. above the sea, separates the basin of the Magdalena from that of the Orinoco. Independently of its political importance, B. occupies a commanding position in relation to commerce. It lies on the most convenient route between Quito and the Caribbean sea; while, by navigable affluents of the Orinoco and the Magdalena, distant respectively 37 and 55 m., it enjoys a twofold access to tide-water. Its immediate vicinity, too, is favorable to the growth of a great city and the maintenance of a large population. The table-land measures about 60 m. from n. to s., and about 30 from e. to w., being bounded on all sides by mountains which, though lofty enough to give shelter, are yet below the line of perpetual snow. This extensive plain—a temperate zone on the verge of the equator with a singularly genial and salubrious climate—is exceedingly fertile, yielding abundant crops of wheat and barley, as also generally of the leguminous plants cultivated in Europe; while, favored as it is with two rainy seasons in a year, it is as rich in pasture as in grain, affording ample sustenance to numerous flocks of sheep and herds of cattle. B. was founded in 1538, consisting then of 13 houses in honor of the 12 apostles. In 1800, it contained 21,464 inhabitants; and in 1821, 30,000; and now it is stated at 50,000. Prospectively, also, the surrounding mountains promise, one day, to give to industry many valuable minerals, such as iron, coal, and salt. The last two, in fact, have already been obtained to some extent. Mines of emeralds, gold, silver, and copper are also said to exist within the same district. B. is regularly and handsomely built. It has four public squares and five elegant bridges over two small rivulets—the San Francisco and the San Augustin. Like every place in Spanish America, it teems with churches and convents—two of the latter overhanging the city on twin hill-tops at a height of 2500 ft. above the general level. B. likewise possesses, in addition to official buildings, a mint, a theater, a university, and spacious barracks. A short way from the city, the rivulets above mentioned join a stream of the same name as the town itself.—The river Bogota, otherwise called the Funcha, is in itself an object of physical interest. It is the single outlet of the waters of the table-land,

which, both from geological features and from aboriginal traditions, appears to have once been a land-locked basin, somewhat like the still loftier and larger plateau of Titicaca. Be this as it may, the river B. has found, if it has not forced, a passage for itself towards the Magdalena. At the cataract of Tequendama the waters plunge over a precipice 900 ft. high; and the clouds of spray clothe the adjacent grounds in the most luxuriant vegetation. About the center of this cataract, known as the fall of Tequendama, stands the natural bridge of Iconouzo, formed as if by the fortuitous jamming of rocks from the opposite sides of the cleft. Between the crest and the foot of this fearful torrent, there exists a difference of climate, which is obviously disproportioned to the mere difference of elevation; and the excess may perhaps be ascribed, in conjunction with the ceaseless moisture, to the wall-like precipice behind, which, besides intercepting the winds, increases by reflection the heat of the sun.

BOGOUSLAV, or BOGUSLAW, a t. of Russia, in the government of Kiew, about 70 m. s.s.e. of the city of that name. It is situated on the Rossa, and has a pop. of 6000, chiefly Jews.

BOG SPAV'IN. This singular name has been applied to a lesion of the hock-joint of the horse, consisting in distension of the capsule inclosing the joint. It usually arises suddenly from a sprain in action. It most commonly affects young horses with defective hocks, and is associated with other indications of weakness of the injured joint.

Symptoms.—As the immediate result of a violent sprain, the hock becomes swollen, hot, and tender, and there is considerable lameness. The acute symptoms subside readily, but a circumscribed swelling remains towards the front, inner, and lower part of the joint. The swelling is soft, partly disappears on pressure, if the joint is moved; but on the horse standing firmly on its limbs, the projection is distinctly visible. At every recurring strain, lameness supervenes, but commonly passes off within a short time. If the B. S. has accidentally occurred in a young horse with good hocks, it may never be attended with inconvenience, and the acute symptoms mentioned do not relapse.

Treatment.—The treatment of B. S. consists in the application of stimulating embrocations, or mild blisters, in the early stage, in severe cases, the golden ointment of iodine is the best application; but we can only obtain a reduction in the inflammatory symptoms, and disappearance of the lameness. The capsular ligament which is injured is never again completely restored, and the horse is more or less blemished for life. See SPAVIN.

BOG-TROTTER, an appellation sometimes contemptuously given to the lower class of the Irish peasantry, has its origin in the ability acquired by many of them of traversing the extensive bogs of their native country, passing from tussock to tussock, where a stranger would find no secure footing, and in the frequent use which they have made of this ability to escape from soldiers, officers of police, or other pursuers.

BOGUE, Rev. DAVID, the founder of the London missionary society, was a native of Berwickshire, being b. at Hallydown, Feb., 1750. After studying at the Edinburgh university, and obtaining his license as a preacher in connection with the church of Scotland, he, in 1771, went to London, where he was for some time engaged in tuition. He afterwards accepted the charge of an independent church at Gosport, where he established a seminary for the education of students who purposed to become Independent ministers, an institution which had a great influence on the connection, as well when it had this object in view as afterwards, when it became a school for the training of missionaries. B. now conceived the idea of a grand missionary scheme, which was ultimately realized in the London missionary society. He also took an active part in the establishment of the British and foreign Bible society and the religious tract society. From this time until his death, which took place in Oct., 1825, he devoted himself zealously to the cause of missions. On his death, an extraordinary meeting of the London missionary society was convened, and resolutions passed expressive of its sense of bereavement, and of the benefits which the deceased had conferred on the society. B. was the author of *An Essay on the Divine Authority of the New Testament*, which has had a circulation only second to that of Bunyan's *Pilgrim's Progress*, having been translated into French, Italian, German, and Spanish; also *Discourses on the Millenium;* and in connection with Dr. James Bennet, a *History of Dissenters*, from the revolution of 1688 to 1808.

BOGUS, bad, or counterfeit; colloquially applied to coin, notes, and even persons, to indicate spuriousness or fraud. It is said to be a partial pronunciation of the name of one Bonghese, a counterfeiter and rogue in general, who some years ago victimized the people of the western states.

BOHADDIN, or BOHA-EDDYN (ABUL-MOHASSEN YUSUF-IBN-SHEDAD), 1145–1235; an Arabian writer and statesman, eminent in the study of the Koran, as well as in jurisprudence. By a work on the *Laws and Discipline of Sacred War*, he gained the favor of the famous Saladin, and was attached to the sultan thereafter, serving in several embassies, and as judge of the army, and judge of Jerusalem; under Saladin's successor he was cadi of Aleppo, where he founded a college. B. continued his intellectual labors to the age of 90 His most important work was a *Life of Saladin*, highly eulogistic, but very instructive.

BOHE'MIA (Ger. *Bö'hmen*), formerly one of the kingdoms of Europe, now forming a part of the Austro-Hungarian monarchy, is situated in lat. 48° 33′ to 51° 3′ n., and long. 12° to 16° 46′ east. It is bounded n. by Saxony and Prussian Silesia, e. by Prussia and Moravia, s. by Lower Austria, and w. by Bavaria. It has an area of 19,822 sq.m; pop. '69, 5,140,544; '75, 5,361,506. It is divided into thirteen circles—viz., Prague, Leitmeritz, Jung-Bunzlau, Jičin, Königgrätz, Chrudim, Caslau, Tabor, Budweis, Pisek, Pilsen, Eger, and Saaz. It contains nearly 400 cities; 250 market-towns; and 650,000 dwelling-houses. B. is surrounded on all sides by lofty mountain ranges, the principal of which are the Riesengebirge (part of the Sudetic chain) on the n.e., dividing B. from Prussia and Silesia, and attaining, in the peak of the Schneekoppe, a height of 5275 ft.; on the n.w., the Erzgebirge, with a height, in some places, of more than 4000 ft.; on the s.w., the Böhmerwald, reaching in its highest point an elevation of 4613 feet. Offsets from these traverse the interior of the country, which has an undulating surface, sloping generally to the center. B. has several fine valleys, the chief of which are those of the Moldau and the Elbe. The country belongs to the upper basin of the Elbe, which rises in the Riesengebirge range; and it is well watered by the affluents of that river, the principal of which are the Moldau—which has its source in the Böhmerwald, and which is navigable from Budweis to Melnik, where it joins the Elbe, a distance of 148 m.—the Eger, Iser, Aupa, Metau, Biela, and Erlitz. B. has no lakes of any considerable size.

The climate of B. is cold in the mountainous regions, the higher peaks being covered with snow during a great portion of the year, but mild in the valleys, and, on the whole, healthful.

The mineral wealth of B. is varied and extensive, consisting of silver, tin, copper, lead, iron, cobalt, alum, sulphur, graphite, calamine, cinnabar, porcelain clay, with several precious and ornamented stones, such as Bohemian garnet (*pyrope*), rubies, sapphires, etc. Of coal, B. produces more than all the rest of the Austrian empire together. It also yields a large supply of asphaltum. Mineral springs are abundant, and those of Carlsbad, Marienbad, Eger-Franzensbad, Teplitz, Elisenbad, etc., are celebrated places of resort.

The soil of B. is generally fertile. More than one half of the area consists of arable land; nearly one eighth is laid out in meadows and gardens; pastures form about a twelfth; vineyards, a very small portion; and forests cover nearly a third. The wheat raised in B. is about a seventh of the produce of the whole Austrian empire. The rye, barley, and oats are, the first a fourth, and the latter two a sixth of all the produce of these kinds of grain. This indicates an agricultural importance to the country, in relation to the Austro-Hungarian empire, not to be easily estimated. Flax and hops are important products in a manufacturing point of view; the yearly crop of flax amounts to 200,000 cwts. Bohemian hops are famous, and 50,000 cwts. are on an average produced yearly. A great variety of fruit is cultivated and exported in large quantities. The culture of the vine is confined to the vicinity of Prague and the lower part of the Elbe.

Various kinds of game are found, and the breed of pheasants is celebrated. Horned cattle, sheep, goats, and swine are reared extensively in some districts; and in the s., geese form an important item in the resources of the country.

In manufactures, B. holds a very high place among continental countries. It is the chief center of dyeing and calico-printing. The linen manufacture, which is more extensive than that of all the other Austrian provinces together, consists of damask, cambric, lawn, and other fine varieties, in addition to the ordinary qualities of cloth. Of the 403,000 spindles employed in flax-spinning in the empire, Bohemia reckons 260,400. The chief seat of the woolen manufacture is Reichenberg and its neighborhood. Another important branch of industry is the paper-manufacture, of which B. possesses more than the half. The glass-works of B. are celebrated, and very numerous and extensive, affording employment to thousands. Beet-root sugar is manufactured extensively, and there are hundreds of breweries and brandy distilleries throughout the country, but they are mostly on a small scale. The manufacture of iron is considerable. The position of B. secures it a large transit trade. Steam-packets ply on the Elbe and Moldau; the horse-railway which, till 1869, connected these rivers at Budweis and Linz, was the oldest on the continent. B. has good roads, and there is an excellent system of railways centering in the capital, Prague.

Population, Religion, and Education.—The Czechs, a Slavonic race, form the bulk of the people. They number 2,930,300, and dwell chiefly in the center and e. of the country. The German population, amounting to 1,835,830, reside mainly on the outskirts, especially in the n.e. The few remaining are Jews. The vast majority of the population (4,599,400) belong to the Roman Catholic church, but other religions are tolerated; the number of Protestants only amounts to 166,000, and the number of Jews is 99,700. The Roman Catholics are under the supervision of the archbishop of Prague, and the three bishops of Leitmeritz, Königgrätz, and Budweis. The monasteries and convents number between 120 and 130. Education is much more widely diffused than in any of the other provinces of Austria. The educational establishments include the university of Prague, 20 gymnasia, and 30 other higher schools; besides 4,550 public schools. B. sends 54—about a fourth of the 203—mem-

bers to the lower house of the Austrian reichsrath, or parliament of the western part of the empire.

History.—The *Boii* (q.v.), from whom B. derives its name, settled in the country in the 2d c. B.C., but were expelled by the Marcomanni about the beginning of the Christian era. The victors themselves soon gave place to others, and as early as the 5th c. A.D., we find B. peopled by the Czechs, a Slavic race. In the latter part of the 9th c., Swatopluk, the king of Moravia, subjugated Bohemia and introduced Christianity. After his death, the dukes of Prague, who in 1061 had the title of king conferred on them, by the emperor Henry IV., ruled the country as a state in the German empire until 1306, when the last of the dynasty was assassinated.

From 1310 to 1437, B. was ruled by kings of the house of Luxemburg. In the time of Wenzel IV. (Wenceslas), a reformation of religion took place under John Huss (q.v.) and Jerome of Prague (q.v.). After the death of Wenzel IV., the imprudent measures adopted by the emperor Sigismund excited in B. a war of sixteen years' duration, which ended in making B. an elective kingdom. In 1458, the shrewd and able Protestant noble, George von Podiebrad, ascended the throne. His successor, Ladislaus (1471–1516), was elected (1490) to the throne of Hungary, and removed the royal residence to Ofen, where also his son and successor, Lewis (1516–26), resided. After his death in battle against the Turks at Mohacz (1526), B. and Hungary passed into the hands of Ferdinand I. of Austria, who had married Lewis's sister. From that time, the history of B. merges in the history of Austria (q.v.).

Bohemian Literature.—The Czechs of B. possess a literature older than that of any other people of the Slavonic stem. Its origin may be dated with certainty as early as the 10th century. Of the oldest period—or before the time of John Huss the reformer—21 poetical and more than 50 prose works are extant. Among the former, the remains of a collection of ballads, etc., made in the 13th c., are remarkable for their poetical merit. John Huss in B., like Luther in Germany, began a new era in literature (1409–1526); but the impulse of his example was far more important than his own writings. The literary remains of the Hussite sects in the 15th c.—dogmatic, polemic, and ascetic works—are still numerous in the old libraries and archives of B., though very many of them perished in the flames the Jesuits kindled during the thirty years' war. Even so late as 1750, the Jesuit, Antony Konias, boasted that he had burned 60,000 Bohemian books. Of historical works of this period, some remains have been edited by Palacky in his *Scriptores Rerum Bohemicarum*, 1829.

The period 1526–1620 is regarded by the Bohemians as their golden age of literature. In this time, especially under Rudolf II. (1576–1611), the arts and sciences were generally cultivated. Prague had two universities and sixteen schools, and the Bohemian language had reached its highest point of cultivation. It cannot, however, be said that the literary works of this period display any great originality of genius. Among the most noticeable is a Bohemian translation of the Bible, which was finished in 15 years by 8 scholars, assembled by John of Zerotin at his castle of Kralic, in Moravia, and was published 1579–93. It is a model of pure and elegant Bohemian.

In Dec., 1774, an imperial decree was issued, ordaining that the German language should be employed by all teachers, lecturers, etc., in the upper schools. This harsh measure excited considerable opposition; and several writers came forward to vindicate the claims of the persecuted dialect, and to develop its powers; but their efforts were attended with little success.

A new and better era began in 1818, with the discovery of valuable remains of old literature, and the publication of edicts favorable to the use of the Bohemian language in schools. Since that time, the progress of the language, as a vehicle of literature and science, has been rapid, and a love of the old dialect has been extended through all classes of society. In Bohemian poetry and belles-lettres, the names of Czelakowsky, Kollar, Holly, Langer, and Schneider, are distinguished. Among scientific writers, mention may be made of Jungmann, Schafarik, Wenzel Hanka, and Presl. In history and archæology, the names of Palacky, Tomek, Schafarik, and Wocel are worthy of notice. Papers entirely political and of mixed politics and literature circulate more largely in B. than in any other part of the empire. In 1875, 108 papers were published in Bohemian, 11 daily. Since 1831, a committee for the cultivation of Bohemian literature has been in existence. Several important works, among them Schafarik's *Slavonic Antiquities*, and Jungmann's *Large Lexicon*, and his *Literary History*, have been published by aid of the committee.

The *Bohemian language* is one of the best dialects of the west-Slavonic; it is spoken not only in B., but also in Moravia, and among the Slowaks in Hungary. Among its sister-dialects, it is distinguished by copiousness of root-words, great flexibility in combinations, precision, and accurate grammatical structure; but like all the Slavonic and most modern dialects, it has no specific form for the passive voice of the verb. The orthography introduced by John Huss in the 15th c. is precise and consistent with itself. Every letter of the Roman alphabet has its one distinct sound. Bohemian prosody is distinguished from that of most European languages by the use of quantity instead of accent, so that it can copy faithfully all the ancient Greek and Roman meters. No other modern language can translate the ancient classics so readily and yet so completely and forcibly, as the Bohemian. Its grammatical forms are complicated and difficult.

BOHE'MIAN BRETH'REN is the name of a religious society which was first instituted in Prague about the middle of the 15th century. It was originally composed of remnants of the Hussites. Dissatisfied with the conduct of the Calixtines (q.v.), they betook themselves, in 1453, to th eborders of Silesia and Moravia, where they settled. Here they dwelt in separate communities, and were distinguished by the name of Brothers of the Rule of Christ. Their adversaries often confounded them with the Waldenses and Picards, while on account of their being compelled during persecution to hide in caves and solitary places, they were also called cave-dwellers (*grubenheimer*). In spite of oppression, such was the constancy of their faith and purity of their morals, that they became profoundly respected, and their numbers greatly increased. The chief peculiarity of their creed was the denial of the ordinary Catholic doctrine of transubstantiation; but, in truth, they rejected tradition generally, and professed to found their tenets only on the Bible. Their ecclesiastical constitution and church discipline—of which the Lutheran reformers spoke highly—was a close imitation of that of the primitive Christian communities. They even went the length of practically denying anything to be secular; and, under the impression that religion should consciously penetrate and characterize the entire life of men, they extended ecclesiastical authority over the very details of domestic life. Their chief functionaries were bishops, seniors and conseniors, presbyters or preachers, ædiles, and acolytes. Their first bishop was consecrated by a Waldensian bishop; though they never united themselves with the Bohemian Waldenses. It was against their principles to engage in war; and having, on several occasions, refused to take up arms, they were at last deprived of their religious privileges. The result was, that, in 1548, about a thousand of the brethren removed to Poland and Prussia. The contract which these exiles entered into with the Polish reformers at Sandomir, 14th April, 1570, and, still more, the religious peace concluded by the Polish states in 1572, secured their toleration; but subsequently, in consequence of the persecutions of king Sigismund III., they united themselves more closely to the Protestants, though even at the present day they retain something of their old ecclesiastical constitution. The brethren who remained in Bohemia and Moravia obtained a little freedom under the emperor Maximilian II., and had their chief seat at Fulnek, in Moravia. In the 17th c., a number removed into Hungary, but during the reign of Maria Theresa were coerced into Catholicism. The thirty years' war, so disastrous to the Bohemian Protestants, entirely broke up the societies of the B. B.; but afterwards they united again, though in secrecy. Their exodus about 1722 occasioned the formation, in Lusatia, of the *United Brethren*, or Herrnhuters. See MORAVIANS.

BOHEMIAN FOREST, or BÖHMERWALD, the mountainous boundary between Bohemia and Bavaria, separating the basins of the Elbe and the Danube; extending 130 m. from s.e. to n.w.; the highest summits 4848 and 4743 ft above tide. Most of the range is covered with dense forests. A railway crosses it through the valley of the Cham.

BOHEMIAN LANGUAGE and LITERATURE have been subjected to literary culture from about the 9th century. The language is the harshest and strongest of the many dialects of the Slavonic family. It abounds in consonants so mixed that to English eyes the words appear unpronounceable. The Bohemians call themselves Czechs (*Cechi*, pronounced tchek-hi), and claim to be the original of their family of peoples. Christianity was introduced near the close of the 9th c., and a few fragments of pre-Christian literature were found in 1817 preserved in a manuscript in a church steeple. The first literary productions of consequence, however, were due to the early German Christians, and were written in Latin. It was not until the beginning of the 14th c., under Charles IV. of Germany, that the native language obtained imperial favor. Dalimil wrote his *Rhyming Chronicle of Bohemia* about 1314, and translations were made from the Latin and other languages into the Bohemian tongue. Sir John Mandeville's travels was one of the books earliest translated, and a complete version of his adventures was made about the end of the century. Among those who should be mentioned as original writers are Thomas Stitny the domestic moralist, Duba the jurist, and Flaska the didactic poet. The next generation witnessed the attempts at both religious and linguistic reform that came to an end in the burning of John Huss and the persecution that followed. The Bohemian language was, indeed, brought into general use, and served the disputants on both sides; but little was assigned to its keeping except the ephemeral productions of political and ecclesiastical strife. A large collection of these works, saved from destruction by the invading Swedes, is still preserved in the library of Stockholm. Of more permanent interest is Paul Zidek's *History of the World*, the travels of Leo of Rosmital through various parts of Europe; those of Kobatnik in Egypt and Asia Minor, and of John of Lobkowitz in Palestine. In the 16th c. there was a remarkable development of prose in various departments of literature. Weleslawin, Paprocky, and Hayek of Liboczun wrote popular histories; Wratislas of Mitrovic, and Prefat of Wilkanowa gave accounts of their travels; and Nicolas Konec, Dobrensky, and Lomnicky produced didactic works. A long period of literary decadence followed the battle of White Mountain (1620); the best blood of the nation went into exile, and such Bohemian literature as came forth appeared in foreign countries. In 1774 a severe blow was struck at the native language by Maria Theresa's decree which enforced the use of German in the higher and middle schools of the country. But the defense of the native tongue was

taken up by count Kinsky, Hauka of Haukenstein, the historian Pelzel, and the Jesuit Balbin. Other scholars espoused the cause, and a chair of the Bohemian language was founded at Prague, and in 1818 a Bohemian museum was established in connection with a society that devoted itself to the study of national antiquities, which society published a journal. Puchmayer, 1795–1820, gave an impulse to national poetry, and was succeeded by Langer, Rokowocel, Schneider, Czelakowsky, H. Kollar, and many other writers. In science Presl, Sadek, Amerling, Smetana, Petcina, Sloboda, and Opiz have attained distinction. The names of writers in politics, theology, and philosophy are too numerous to mention.

BOHEMOND I., eldest son of the Norman conqueror of Apulia and Calabria, Robert Guiscard, was born about 1056, and during his youth distinguished himself in his father's war against the Byzantine emperor, Alexis Comnenus (1081–1085). After his father's death, he was excluded from the throne of Apulia by his brother Roger, and only gained the principality of Tarentum after a long contest. He joined the crusade of 1092 with a large army—most of which he had won over from his brother's service—and took a prominent part at the fight of Dorylæum, in Cilicia, in 1096, and at the capture of Antioch, 1098. While the other crusaders advanced to storm Jerusalem, B., remained in Antioch, where he established himself as prince. Being soon after besieged, the Christians, reduced to extremities, came out, and gave the sultan battle, and entirely routed his forces, B. greatly distinguishing himself in the fight. He was afterwards made prisoner by a Turkish emir, and remained two years in captivity. Tancred, meanwhile, looked after his interests in Antioch. B. returned to Europe to collect troops, and after defeating Alexis in several engagements, was acknowledged by that emperor as prince of Antioch. He died in Apulia, 1111.—His son B. II., a minor at the death of his father, assumed the government of Antioch (after Tancred had been regent for some years) in 1126, and was killed in battle, 1130.—B. III., grandson of the former, was allowed to retain sovereignty only by the clemency of Saladin, and died 1201.—B. IV. (1233–51) and B. V. (died 1275) were insignificant princes; and with B. VI. the Christian dynasty in Syria was brought to a close.

BOHLEN, PETER VON, 1796–1840; a German oriental scholar, mainly self-educated; professor of oriental languages in the universities of Halle, Bonn, and Konigsberg. His works, except an autobiography, are mostly on the languages of the East.

BÖHLER, PETER, 1712–75; a German theologian and Moravian bishop, who came to America in 1738, and founded the village of Nazareth, in Pennsylvania.

BÖHM, THEOBALD, a Bavarian flute-player, b. 1802; the inventor of the flute bearing his name, which has superseded the old kinds. He had some reputation as a composer.

BÖHME, or **BÖHM**, JAKOB, a German theosophist and mystic, was born of poor parents at Altseidenberg, near Görlitz, in Upper Lusatia, 1575, and spent his boyhood in tending cattle. He received no instruction till he was ten years of age; but even then, the contemplation of earth and sky had so excited his naturally pious imagination, that he conceived himself inspired. He learned the trade of a shoemaker, but continued to devote much of his time to meditation on divine things. About 1612 was published his first book, called *Aurora, or the Morning Redness.* It contains revelations and meditations upon God, man, and nature; betokens a remarkable knowledge of Scripture, especially of the apocalyptical books; as also a familiarity with the writings of the mystico-philosophic alchemists. It was condemned by the ecclesiastical authorities of Görlitz; but the persecutions to which its author was subjected, had not the effect of convincing him of his errors. B.'s fundamental speculation is, that the forthcoming of the creation out of the divine unity—which is itself distinguishable into a trinity—can be contemplated by mystic illumination, and expressed in words. The object of his mystic contemplation, accordingly, is twofold; first, God himself apart from creation, or, to use some of B.'s own synonyms, the groundless, the eternal one, the silent nothing, the *temperamentum;* and, secondly, the forthcoming of the creature out of God. This forthcoming of the creation, which is also an in-going of the silent nothing, is, according to B., the principle of negation, and he calls it "contrariety." "All things," he says, "consist in yes and no. The yes is pure power and life, the truth of God, or God himself. The no is the reply to the yes, or to the truth, and is indispensable to the revelation of the truth. So, then, the silent nothing becomes something by entering into duality;" and so on into what most minds will think utter unintelligibility. Numerous attacks from theologians disturbed B.'s last years, but he bore them all with great meekness. They were probably occasioned by a tract on repentance which his friends had printed without his knowledge; and so great was the interest excited, that he was induced by the solicitations of certain courtiers and of his friends, to visit Dresden for the purpose of having his doctrines investigated. The court applauded and protected him. On returning to Görlitz he took ill, and died 27th Nov., 1624. The first collection of his writings was published by Betke (Amsterdam, 1675); the most complete in 1730, at the same place; and the latest (1831–46) by Schiebler, at Leipsic. Next to Germany, Holland and England are the countries in which B.'s works have been received with most favor. In England, where B. was generally called Behmen, a translation in 2 vols.

quarto was published in 1764. Sir Isaac Newton studied him; William Law, of Oxford, might be called a disciple; in 1697, Jane Lead, a fanatical disciple of B., founded a sect called the Philadelphists, for the exposition of his writings; and John Pordage, a physician, is also famed among his English interpreters. Abraham von Frankenberg, who died in 1652, published the earliest biography of Böhme. In modern times, and in connection with speculative philosophy in Germany, his views, which had come to be regarded as empty mysticism, have acquired fresh interest and importance. This arises from the kindred character of his fundamental principle with the spirit pervading the systems of Spinoza, Schelling, and Hegel. The intellectual contemplation of the absolute, out of which the contradictions in the world of phenomena proceed, and into which they return, is common to these systems and to B.; Hegel, indeed, expressly represents B.'s negativity, the active principle of development, as an obscure foreshadowing of his own intuitions, and on that account places him at the head of modern philosophy. The terminology of his philosophy, as will be seen from what we have quoted, is utterly fantastic; but his imagination often conceives splendid ideas, which are more profoundly appreciated in the 19th than they were in the 17th century. See Hamberger's (1844), Fechner's (1857), Peip's (1860), and Harless's (1870) works on B. and his philosophy.

BOHN, Henry G., a well-known author, translator, and publisher, of German parentage, was born in London, Jan. 4, 1796. It is impossible to estimate too highly the services he has rendered to the community by republishing, at a cheap rate, a vast number of the most valuable works in literature, science, philosophy, theology, etc. Such collections as the Standard library (130 vols.), the Scientific library, Library of French Memoirs, the Illustrated library, the Classical library (consisting of translations into English of the Greek and Latin authors), the Antiquarian library, the Ecclesiastical library, etc., contain the intellectual wealth both of the ancients and moderns. Mr. B. has also obtained distinction as the editor of the *Bibliotheca Parriana*, of Lowndes's *Bibliographer's Manual*, etc., and as translator of Schiller, Goethe, and Humboldt. He has compiled a *Polyglot of Foreign Proverbs*, an *Illustrated Handbook of Geography*, and a *Handbook of Pottery and Porcelain*.

BOHOL', or Bool, one of the Philippine islands, discovered by Magellan in 1521: in 9° 54′ n., and 124° 21′ e.; 46 by 32 m.; produces rice, cotton, cocoa-nuts, cocoa-nut oil, cattle, and coarse silk. There is some gold in the rivers.

BOHTLINGK, Otto, b. St. Petersburg, 1815; a member of the academy of science and councilor of state; well versed in Sanskrit, Yakut, and oriental tongues. His main work is a comprehensive Sanskrit-German dictionary in 7 vols., in which he had the assistance of prof. Rudolf Roth, of Tübingen.

BOHUN UPAS. See Upas, *ante*.

BOIARDO, Matteo Maria, Count of Scandiano, one of the most celebrated Italian poets, was b. at Scandiano in 1430 or 1434. After completing his studies at the university of Ferrara, he was introduced at the court of duke Borso d'Este, by whose successor, Ercole I., he was promoted to several honorable offices. In 1478, he was made governor of Reggio; in 1481, governor of Modena; and six years later, he again became governor of Reggio, where he died in 1494. His chief work is the romantic chivalrous poem, *Orlando Innamorato*, which he left unfinished in three books. Former writers had described Orlando only as a cold, pure, champion of Christendom; but B. introduced the element of love, to give an additional charm to romantic adventure. The method in which he does this not only proves him to have possessed a truly creative faculty, but also brings his conception nearer to the reality of history. B. furnished to all his poetical successors, even to Ariosto himself, the personages who figure in their adaptations of the old romance. His work was printed sixteen times before 1545, and was translated into French as early as the 16th century. As it was written in the dialect of the court of Ferrara, it failed to give satisfaction to the Florentines. Accordingly, after several attempts had been made to purify its diction, Lodovico Domenichi (died 1564) produced a *Riformazione* of the poem, 1545, without making any important change in the substance. Berni, in his *Rifacimento*, proceeded further, and gave to the whole poem a tone of burlesque; but his version enjoyed such popularity that it took the place of the original, which was almost entirely forgotten, until it was republished with introduction and critical observations by Panizzi (9 vols. Lond. 1830), and afterwards by Wagner in his *Parnasso Italiano Continuato* (Leip. 1833). The other works of B. include *Sonetti e Canzoni* (Reggio, 1499); *Il Timone*, a five-act drama (1600); *Cinque Capitoli in Terza Rima* (1523); and *L'Asino d'Oro*, a version of the *Golden Ass* of Appuleius (1523); besides a translation of Herodotus (1533), and of Riccobaldi's *Chronicon Romanorum Imperatorum*.

BOI'I, the name of a Celtic people who at a very remote period seem to have inhabited either the southern part of Belgium, or a portion of France in its immediate vicinity, whence they emigrated to Italy. Having crossed the Po, they established themselves in the territory of the Umbrians, lying between that river and the Apennines, and for some hundreds of years waged a fierce war with the Romans. They were defeated at the Vadimonian lake in 283 B.C.; at Telamon, in Etruria, in 225 B.C., during the great Gallic war, of which they were the original cause; rushed into rebellion on hearing of Hanni-

bal's march, joined him at the battle of the Trebia in 218 B.C., destroyed the entire army of the consul Postumius in 216 B.C., took a prominent part in the revolt of the Gauls under Hamilcar, and in the destruction of Placentia, 200 B.C.; but at length, in 191 B.C., they were completely subdued by Scipio Nasica, who, besides killing a vast number, took from them nearly one-half of their land. At a later period, they were dispossessed of the whole, and driven across the Alps. Their subsequent history and geographical position are not very clear. Those who settled s. of the Danube were, after a century, exterminated by the Dacians; those who returned to Gaul, were destroyed by Cæsar. The most important migration of the B., however, was that to the n. of the Danube, where they founded the extensive kingdom Boiohemum, which was overthrown by the Marcomanni under Marbod. But though the dynasty of the B. was thus destroyed, the kingdom retained the name Boiohemum—i.e., home of the B., whence comes the modern Böhmen, or Bohemia.

BOIL (allied to Lat. *bulla*, a bubble) is a hard painful swelling of the skin. It begins as a small hard point of a dusky red color, which is hot, painful, and throbbing. This point extends, and these symptoms increase in severity till about the sixth to the ninth day, when it ceases to enlarge, is of a conical form, with a broad firm base, and on the apex a whitish blister, which contains a little matter; this opens, and after a few days more there is discharged a core or slough of cellular tissue, and the small cavity left heals rapidly, leaving a white depressed scar.

Many kinds of boils have been described, but they may, like other diseases of an inflammatory nature, be divided into those which are *acute* and run a rapid course, as above described; and the *chronic*, which take three or four weeks to "come to a head." Boils are most common in the spring, and in young and plethoric persons, and their appearance is quite consistent with robust health. Men in training for boat-races, or others who have suddenly changed their diet and daily habits, are said to be very subject to them. There is a form of B. which generally occurs on the back of the neck, after some disorder of the stomach, in elderly people, hence it is called "Old People's Boil." In some, boils continue to succeed each other for a length of time; others are attacked during the night, after having experienced feelings of nausea and languor, by pustules, which are called night-boils (epinyctis).

The treatment of boils varies with the subject of them: in many, they are merely critical—in other words, a natural effort "to relieve some function of the body by a peculiar inflammation of the skin." The intestinal canal should be cleared out by laxative medicines, and the digestive powers improved by tonics and antacids. The skin should be kept healthy by frequent washing, while the inflamed spot should be poulticed with poppy-heads or hemlock, mixed with other materials. Wet lint is a sufficient application after the core has been thrown off. If the patient chooses to submit, however, to a momentary pain, he will, have the greatest, most permanent, and immediate relief from a cut carried quite through the boil. John Hunter, the great surgeon, got rid of habitual boils by taking repeated doses of soda in milk.

BOILDIEU, ADRIEN FRANÇOIS, an eminent French composer, was b. at Rouen in 1775. His talent for music was early developed. At the age of 18, he brought out a one-act opera in his native town, and two years afterwards he repaired to Paris, where he produced many successful compositions. When the Conservatoire de Musique was established, B. was elected a professor. In 1803, he went to Russia, where he was appointed, by the emperor Alexander, *maître de chapelle* at the imperial court. He remained in Russia eight years, during which time he produced several operas. In 1811, he returned to Paris, where he brought out *La Dame Blanche*, his most popular piece, *Jean de Paris*, *Le Petit Chaperon Rouge*, and other works. He died in Oct., 1835; and, as a tribute to his genius, the nation honored him with a public funeral. His native city claimed his heart, and to defray the pomp of its reception in the cathedral, the municipality voted 12,000 francs. The government further marked its sense of his merit by granting a pension to his son.

BOILEAU DESPREAUX, NICOLAS, an illustrious French poet, was b. near Paris, Nov. 1, 1636. After hesitating for some time in the choice of a profession, he betook himself to *belles-lettres*. In 1660, his fine powers first obtained an adequate expression in the satire, entitled *Adieux d'un Poète à la Ville de Paris*. In 1666, he published his seven *Satires*. The favorable reception which they met with, induced him to continue, until he had increased the number to twelve, of which the eighth and ninth are considered the best. In these satires, B. even ventures to castigate the *coryphæi* of the world of letters—Chapelain, Cotin, Scudery, etc. To his honor, however, it must be said that malice does not once animate his pen; he is always pleasant and gay, never cruel. His contemporaries are his laughing-stocks, not his victims. Between the years 1669 and 1696 appeared his *Twelve Epistles*. They indicate a riper genius than the *Satires*. The versification has more ease and grace; the style, a quicker movement and a firmer consistency; the thoughts are more vigorous, and more strictly concatenated; everywhere there is greater truth, color, and energy. The one addressed to Racine, who, along with B., filled the office of royal historiographer, is reckoned among his finest. In 1674, B. published *L'Art Poétique*, accompanied by a translation from the Greek of *Longinus on the Sublime*, and the greater part of *Lutrin*. These are by many French critics consid-

ered his *chefs-d'œuvre*. The first is indeed an exquisite performance, and has been copiously imitated in Pope's *Essay on Criticism*. It lays down rules for almost every species of poetry, in a clearer and more methodical manner than had ever been done before, while the whole poem is sprinkled with touches of delicate satire. The second, *Lutrin*, is a comic epic in six cantos, immensely admired by his countrymen. Besides these, B. wrote several minor pieces, both in prose and verse, such as—*Dialogue des Héros de Roman, Dissertation sur Joconde, L'Arrêt Burlesque*, and *Discours sur la Satire*. A large number of his letters have been collected. Among them are twenty to Racine. The letters of B. are in general extremely valuable, from the fact that they contain a large proportion of the literary history of the time. They also enable us to form a just idea of his character. He was high-minded, generous, and pure. In fact, his impulsive disposition and imprudent warmth of heart quite contradict the common notion of what a satirist is. When Corneille's pension was ordered to be stopped, after the death of Colbert, B. flew to the king, remonstrated against so "barbarous a spoliation," and threatened to resign his own if the decree were carried into effect. He courageously denounced the persecutors of the nuns of Port Royal; expressed his admiration of Arnauld, when the latter was on the point of being arrested; extricated out of pecuniary embarrassments many friends; and through sheer kindliness of heart, forced on a reconciliation with various of his literary adversaries. An admirer of Pascal, and a friend of the Jansenists, he could yet render homage to the talents of such Jesuits as Bourdaloue, Bonhours, and Rapin; but his most intimate and cherished companions were Molière, Racine, and Lafontaine. Until 1706, B. lived much in public, but after that his bodily infirmities induced him to retire to Auteuil. He died March 13, 1711. B.'s influence on French literature has been immense, and, on the whole, beneficial. Voltaire proclaimed him "the legislator of Parnassus."

BOILER (Fr. *chaudière*, Ger. *kessel*), the name given to a vessel in which steam, usually for a steam-engine, is generated. In its simplest form, it consists of a close vessel made of metal plate, having apertures for the admission of water and egress of steam, fitted with apparatus for showing the level of the water and the pressure of the steam, and in connection with a furnace, either internal or external. When water is boiled in an open pan, the temperature of the water and of the steam rising from it, remains at or very near 212° F., and the tension or pressure of the steam is no more than sufficient to make its way into the atmosphere, being exactly equal to that exerted in all directions by the atmosphere itself—namely, 14.7 lbs. per square inch. In a close vessel, on the other hand, the temperature and pressure to which we can raise the steam are only limited by the strength of the vessel or boiler against bursting.

The form of a boiler is determined by two considerations—namely, strength to withstand internal pressure, and efficiency in producing steam; and the object of the designer is to combine in one apparatus sufficient strength to work safely at the proposed pressure, with such a form and arrangement as shall abstract the maximum of heat from the gases of combustion, and at the same time be in all respects suitable to the special circumstances of the case. The globular form is that best adapted for strength, and was the earliest to be used. It presents to the fire, however, the minimum area in proportion to its contents, and therefore has a minimum efficiency. After spherical boilers, cylindrical ones came into use, at first set on end, and afterwards laid on their sides, and later on, these were furnished with internal cylindrical tubes for furnaces. Watt's "wagon boiler" (so called from its shape) was used for many years, but being quite unfit for any but the lowest pressures, it has long been discarded; and the "egg-end" boiler, or plain cylinder with hemispherical ends, also much used at one time, has now almost disappeared on account of its small evaporative efficiency. At present, it is quite common to use a working steam-pressure of 50 lbs. per square inch in ordinary factory boilers, and in some cases this is already greatly exceeded, while the tendency to use higher pressures seems to grow yearly. Under these pressures, the only forms of boiler which can be used without heavy and expensive internal stays to prevent the danger of bursting, are the globular and the cylindrical. The former shape is rejected for the reason already given, and the latter form is used almost invariably in the construction of modern boilers, as will be seen from the examples given below. The ends of the cylinders, when it is necessary to make them flat, must, of course, be strengthened by stays.

Boilers may be classified in several ways—as (1) horizontal and vertical; (2) internally and externally fired; and (3) plain, multitubular, and tubulous. Large boilers are almost invariably horizontal, but small vertical boilers are often used. They are employed in steam-cranes (q.v.) and other situations where great length would be an inconvenience, and often in traction-engines, where steep inclines have to be traversed, and where, if a locomotive boiler were used, one or the other end of its tubes might become uncovered, and so get burned. In Great Britain, when moderately good fuel is used, boilers with an internal furnace are generally preferred; but on the continent the common brown coal is much inferior to our fuel, and a correspondingly larger quantity of it must be used to generate a given volume of steam. As the size of a furnace limits the fuel which it can burn, this frequently involves having a much larger grate than could be conveniently arranged inside the boiler, and on this and other accounts boilers are, on the continent, more frequently externally fired than in this country.

Under the head of "plain" boilers come all ordinary cylindrical boilers, with or without internal furnaces, horizontal or vertical. They are the cheapest and simplest which can be made, and, if properly proportioned, possess a considerable evaporative efficiency. When it is necessary, however, to economize fuel, or space, or both, "multitubular" boilers are used. These derive their name from the fact that in them the flame and gases of combustion are made to pass through a great number of small tubes (surrounded by the water) on their way to the chimney. The steam-generating power of a boiler depends greatly on the extent of surface which it presents to the flame, and it is obvious that a great number of small tubes present a much larger surface than one large tube occupying the space of them all. Thus, with the same heating surface, a multitubular boiler will occupy much less space than a plain one, and at the same time the efficiency of its surface is found to be greater. It is, however, necessarily more expensive and more liable to get out of order. Tubulous boilers differ from multitubular boilers in not only containing tubes, but *consisting* of them, and having no large cylinders whatever. Their chief advantages are (*a*) their great strength, for it is easy to make a wrought-iron tube strong enough to withstand pressures far higher than any at present in use; and (*b*) the peculiarity, that if any accident happens, or explosion occurs, it will only be to one tube at a time, and not to an immense boiler shell (as with the common boiler), and its evil consequences will thus be greatly reduced. For this reason tubulous boilers are often called "safety" boilers. It will be readily understood that there is no distinct line of demarkation between the three classes of which we have been speaking, but that on account of the immense variety of boilers which have been designed and constructed, those of one class pass through gentle gradations into those of the next.

The commonest form of boiler for factories, etc., is that known as the *Cornish*, and shown in fig. 1. It consists simply of a cylindrical shell, *a*, *a*, inclosing a much smaller cylinder, *f*, *f*, called a *flue*. The ends of the flue are open, but the space between it and the shell, which contains the water, is of course closed up and made steam-tight. The fire-grate, *d*, is in the interior of the flue, and at the end of it is a brick bridge, *c*, made so as to cause the flame to impinge on the upper side of the flue. The boiler is set in brick-work; and the flame, passing out at the back end of the flue, is made to traverse the whole length of the boiler twice through brick flues before passing away to the chimney.

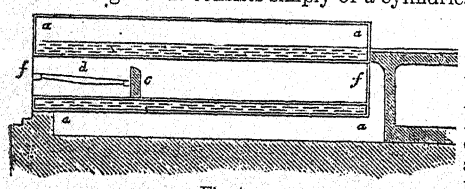


Fig. 1.

The Cornish boiler has often two internal flues or tubes, which is a much more advantageous construction than that shown in fig. 1. The *Galloway* boiler (called after its inventor) is a very excellent modification of the Cornish, which in outward appearance it exactly resembles. It has two furnaces, but these join together in one chamber just behind the bridges, and the gases are made to pass through a space considerably narrowed by side *pockets* projecting inwards in order that they may be well mixed. From this point to the back of the boiler there is just one flue, made oval in section, and crossed by a considerable number of vertical taper tubes, which form a direct communication between the water beneath and that above the flue. These tubes (called "Galloway tubes") both promote circulation and strengthen the flue. Multitubular boilers of many kinds are used, both for stationary engines and other purposes, but the largest number of those constructed are certainly for steamers, and a common type of marine boiler is shown in fig. 2. The shell, *a*, *a*, is cylindrical, and contains one or more cylindrical furnaces; *c* is the fire-grate; *d*, a brick bridge; *e*, a combustion chamber or flame-box; *f*, the tubes through which the flame passes back to the front of the boiler; and *g*, the smoke-box at the base of the funnel, *h*. The line *k*, *k*, shows the ordinary level of the water in the boiler. On board ship it is of course an object to take up as little space as possible with boiler and machinery, and at the same time to have boilers which shall use as little coal as possible, both because of the saving in cost, and because of the saving in the room taken up by coal. For all these reasons, marine boilers are invariably multitubular.

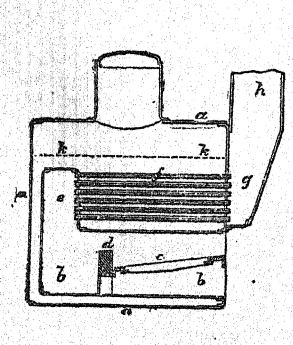

Fig. 2.

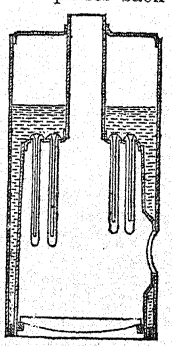

Fig. 3.

The varieties of vertical boilers are as numerous as those of horizontal. When dirty water, or water containing much insoluble sediment, has to be used (as e.g. in steam-cranes frequently), they are of the simplest construction, with nothing but an inner fire-box and an outer shell (both cylindrical), the space between them being filled with water all round and over the top of the fire-box.

If clean water can be had, however, and it is desired to be at all economical of fuel, some kind of multitubular vertical boiler must be used, and of these probably the best is that known as the *Field* boiler, and shown in fig. 3. The peculiarity of it consists in the tubes, which are closed at the bottom, and hang down from the top of the fire-box over the grate bars, and contain inner tubes of much smaller diameter. The latter are intended to aid the circulation of the water, which passes down the inner tube and up again through the annular space around it, where, being most exposed to the action of the flame, it is hottest. Of the different varieties of tubulous boilers, those manufactured by Messrs. Howard of Bedford have found most favor; but so far as can be said in the absence of any extended experience as to their working, Sinclair's patent boilers seem to be even more satisfactory. They consist of horizontal wrought-iron welded tubes placed in vertical rows, each row being connected at each end with a vertical tube, also of wrought-iron and of larger diameter. In order that the horizontal tubes may be properly fixed in the vertical ones, a hole must be provided in the side of the latter, opposite the mouth of each of the former. That these holes may be kept tight at any pressure of steam, the ingenious device is adopted of closing them with taper plugs put in *from the inside*, so that the pressure of steam keeps them shut, and the higher the pressure the less possibility of leakage there is. Locomotive boilers are always multitubular, for much the same reasons as marine boilers. The boiler of a single locomotive often contains 1500 or 1800 sq. ft. of heating surface, and occasionally as much as 2000 sq. feet.
